CANADA:

The Land and the People

By PIERRE BERTON

AS 1955 reached its close, the people of Canada could look back with wonder and humility on the most remarkable ten-year period in their history. It was a decade to stir the national pride and quicken the common pulse, when the land disclosed unexpected bounties and the people reaped unexampled rewards—a decade of expansion and buoyancy that focused the eyes of the world on this enormous yet curiously empty country that sprawls across the northern half of North America.

Canada is less than 90 years old politically. Its people make up less than two-thirds of one per cent of the world's population. Yet for most of the decade, until it was edged out by Western Germany in 1954, it ranked third, after the United States and Great Britain, among the great trading nations. Though still partially undeveloped, it produces more nickel, platinum, newsprint and asbestos than any other country. It stands second among all nations as a producer of aluminum, gold, cobalt, zinc, wood pulp and hydroelectric power, third as a producer of silver and sawn lumber, and fourth as a producer of lead and wheat. The mineral finds of the last ten years have been greater than those of the entire previous century. In 1945, Canada imported all of its iron and virtually all of its oil. Today it is fully self-sufficient in the first and almost self-sufficient in the second. Within a decade it seems likely to become the world's largest exporter of iron and one of the top three or four producers in the world. In 1955 some geologists were predicting that its newly discovered oil fields might contain one of the four greatest concentrations of petroleum products in the world—perhaps the greatest. It has a higher potential supply of hydroelectric power than any nation except the U.S.S.R., its forests are exceeded only by those of the U.S.S.R. and tropical Brazil, and it produces enough wheat each year to feed almost 100,000,000 people. Canadians like to boast that next to the U.S. they enjoy the highest standard of living in the world.

These are some of the reasons why Canada has been in the news ever since the close of World War II. Most of the literate world knows that the country is enjoying an unprecedented economic boom and that many of its natural resources remain unexploited. Much less, however, is known of the land itself, or the people who live in it.

PIERRE BERTON is managing editor of *Maclean's*, Canada's popular fortnightly magazine. He was born in Whitehorse, Yukon Territory, where his father had gone during the gold rush of 1898. As city editor of the daily *Vancouver News-Herald*, feature writer for the *Vancouver Sun*, war correspondent in Korea, author of three books about Canada and more than 100 articles, his various assignments have taken him all over the country, especially the arctic and sub-arctic, and to Europe and South America.

"No one knows my country, neither the stranger nor its own sons." So wrote Bruce Hutchison, a leading Canadian journalist, in 1943. "My country is hidden in the dark and teeming brain of youth upon the eve of its manhood. My country has not found itself nor felt its power nor learned its true place. It is all visions and doubts, hopes and dreams. It is strength and weakness, despair and joy, and the wild confusions and restless strivings of a boy who has passed his boyhood but is not yet a man." (From *The Unknown Country* by Bruce Hutchison. Longmans, Green and Co., Toronto.)

The statement still applies and misconceptions still continue to exist about this new and rising nation that looks so simple and uncomplicated on the surface, but on closer examination turns out to be one of the world's most puzzling communities.

To most Europeans there is very little difference between Canadians and Americans.* To some Americans, Canadians seem very European with their Queen and prime minister. But the great fact of Canada is that it is neither American nor European and anyone who seeks to understand the Canadian people must grasp this essential truth. Canadians are the unique North Americans: their personality has been tempered in the twin forges of environment and history; they live in a country that has been called a political impossibility; they have been subjected to external pulls and pressures that exist nowhere else in the world; now through a long and painful effort of will they are moulding themselves and their land into a single cohesive community.

A coincidental set of circumstances, not the least of which was a fear of U.S. aggrandizement, caused the confederation in 1867 of a scattered group of British North American provinces. Considerably changed and expanded, these have become the Canada of today. Canada, then, is still a very young country. Two of its provinces, Alberta and Saskatchewan, only celebrated their 50th anniversary in 1955. They were created, half a century ago, out of an unpopulated wasteland of waving grass that has today become the breadbasket of the world and the home of almost 2,000,000 people. In those 50 years the whole nation has changed so that it is scarcely recognizable as that same land to which Sir Wilfrid Laurier referred prophetically when, as prime minister, he remarked that "the twentieth century shall be the century of Canada."

Since its confederation Canada has undergone three basic changes.

It has changed from a rural to an urban land. At the time of confederation, 81% of the population was rural. This figure has now dropped below 39%. The shift is still continuing: of the ten provinces, only Saskatchewan, the great agricultural

* The terms "America" and "Americans" are used here to distinguish the United States and its people from other North American countries and people.

CANADA: GEOLOGY AND POPULATION. Four of the principal geologic divisions are shown; the shield is of especial importance as the source of much of Canada's mineral wealth and as a natural barrier between east and west. The 15 cities shown contained 37% of the country's population according to the census of 1951

province, is still predominantly rural. Yet the nation's wheat production has increased sevenfold in the past half century.

It has changed from a country dominated by the production of primary products to a country dominated by the manufacture of secondary products. By 1955, 68.7% of its total production was going into manufacturing and construction.

It has changed from a colony, subservient politically to a European scheme, and culturally and economically to an American colossus, into an independent nation, able and ready to stand on its own feet.

The appointment of a Canadian-born governor general, the tacit dropping of the word "dominion" (which some Canadians consider subservient), the threat to build the St. Lawrence sea-way without U.S. help—all these are recent manifestations of a growing independence.

Two inevitable questions follow: How is it that a nation, wealthy in resources and larger in area than the U.S., still remains sparsely populated and partially undeveloped? And what is it that has made Canadians so different from other North Americans? It is with these two questions that this article is largely concerned.

THE LAND

On the map, Canada, like the U.S., looks rectangular. It extends almost 4,000 mi. from east to west and 2,800 mi. from

the southern border to the tip of the Arctic archipelago. Canada is the second largest country in the world, covering 3,845,774 sq. mi., exceeded in area only by the Soviet Union. But its shape is deceptive. Ninety per cent of the land is virtually unpopulated. Half the people live within 100 mi. of the U.S. border; 90% within 200 mi. of it. Politically Canada is another Chile—a slender strip 4,000 mi. long and 200 mi. thick, to which is appended a vast arctic and subarctic world of rock, tundra, muskeg, mountain, lake and forest. This political shape is one of the clues to an understanding of Canada, for so much that is distinctively Canadian—politics, economics and national character—depends upon it.

Climate and Structure

What is the reason for this singular concentration of population? European cities such as Oslo, Leningrad, Stockholm, Edinburgh and Copenhagen thrive in latitudes where no Canadian communities of appreciable size exist. Why shouldn't there be cities of comparable size in northern Canada?

One reason is climate. The chill Labrador current sweeps down the Atlantic coastline from the ice-choked Arctic and as a result subarctic conditions are to be found on the latitude

CANADA: The Land and the People

of London, Eng. The city of St. John's, Nfld., is actually farther south than Paris, Fr., but spring reaches it no sooner than it reaches the Mackenzie valley in the Northwest Territories. The huge expanse of Hudson bay, gnawing into the heart of the continent, acts as an enormous thermostat to keep the summers bleak; the winds that sweep across it from the Arctic and from the Greenland ice cap add to the bleakness. As a result, the great Arctic cold desert, the tundra, reaches down almost as far south as the latitude of Copenhagen. The climate of the interior plains of Canada is continental. The mercury can rise above 100° F., even in the north, and drop almost to -70° F. as far south as Winnipeg. The mean temperature of the settled plains in January is about -5° F.; in July it is 80° F.

The structure of the land is the second reason for Canada's sparse population. Two great barriers to development exist: the Cordilleran mountain ranges on the west and the Canadian shield on the east. Most of the province of British Columbia is choked by an ocean of mountains that rise to a height of 12,000 ft., giving the interior an alpine climate and effectively diking the flow of population. More significant is the Canadian shield, an enormous armoured horseshoe of muskeg-covered rock that defies settlement. A shield is a rigid area of resistance and there are several in the world, but the Canadian shield is the one best known to geologists. It covers half the nation and is the greatest hindrance to frontier development. It covers almost all of Quebec and Labrador, sweeps down to the edges of the Great Lakes, and curves back northwest through Manitoba and northern Saskatchewan to the tip of the Mackenzie river valley and the rim of the Arctic ocean. Some of its rocks go back 2,000,000,000 yr. in time, before life itself, and the succeeding pressures of the ages have transformed them out of all recognition. They are the stubs of ancient mountains, long since

eroded down to a peneplain, the hollows filled with fresh water, so that there are more lakes on the shield than in all the rest of the world put together.

Across most of the shield's rocky expanse agriculture is impossible, for the glaciers of the Pleistocene epoch stripped it clear of topsoil 1,000,000 yr. ago. The ice upset the drainage pattern as well, so that there are no great navigable rivers on the shield, and this, too, is a bar to settlement. Road and railroad construction over this granite sea is almost prohibitively expensive. When the Canadian Pacific railway was blasted through the Pre-Cambrian cliffland bordering Lake Superior, so much explosive was required that dynamite factories had to be built on the spot.

Before a single ton of iron ore could be brought from the Labrador interior, an outlay of \$235,000,000 was required, the greater portion going into the construction of a 360-mi. railway across the shield.

Yet the shield is largely responsible for Canada's mining boom. Cursed as a wasteland a few decades ago, it is now hailed as a treasure chest. All of Canada's uranium, nickel, titanium, platinum and cobalt comes from the shield, together with 95% of its copper, 92% of its gold, 85% of its iron, 75% of its pulpwood and 56% of its silver. (The famous Mesabi iron range in the U.S. is a spur of the shield.)

The North-South Pull

Looking again at the map, the stranger may well ask: "Why Canada at all?" For the continental grain runs generally north and south while the border runs east and west, cutting arbitrarily across the interior plains and the Cordilleran spine to the Pacific. In Canada, politics and geography are at war. A Nova Scotian is more likely to go to New England for a holi-

DOG TEAM near Churchill, Man., an arctic plain in the latitude of Stockholm, Swed.

TORONTO, ONT., AT NIGHT

day, where the white Gothic churches and little fishing villages are more familiar to him than the Norman spires and strip farms of neighbouring Quebec. A tourist from Buffalo, N.Y., will find himself completely at home in Toronto, Ont., with its skyscrapers, cocktail bars and department stores. High school graduating classes from North Dakota and Montana small towns often go on two-day excursions to Regina, Sask., the nearest large city, which looks very like any small city in their home states. British Columbians holiday in California, where the climate, the architecture, the seacoast and the casual dress are somehow more familiar than is eastern Canada. The north-south pull shows itself in other ways, too: in defense, for example, which is now continental; and in trade. Canada has, for instance, the second largest coal reserves in the world. But the coal is found largely in Alberta and Nova Scotia, while the bulk of industry is concentrated in central Canada. For these reasons it is cheaper for Ontario to import its coal from the neighbouring states of the United States, than to haul it for thousands of miles from Canadian sources. Alberta's enormous coal deposits remain largely unmined.

The East-West Inlet

Why then does Canada exist as a separate entity? The answers are largely political but there are some geographical clues as well. The chief one is the great St. Lawrence-Great Lakes water highway that knifes laterally for more than 2,000 mi. into the heart of the continent. This was the ancient fur trade route into the interior. It has its continuation in the long valley of the Saskatchewan river that cuts across the plains from the shores of Hudson bay to the barrier of the Rockies, and in the notches of the mountains themselves—the three passes through which the transcontinental railways go.

Without the presence of this great waterway, it is doubtful whether Canada could have developed as a separate nation. The country had its genesis in the St. Lawrence valley which has now become its industrial core. Canada's past lies here. The savage struggles with the Iroquois, the early, awkward revolts against colonialism, the first faint stirrings of nationhood, all took place along the St. Lawrence and the lakes.

Canada's future lies here, too, for the St. Lawrence seaway, which is expected to be completed by 1960, will turn the lake and river cities into seaports. The chief construction job involves the deepening of the International rapids section of the river above Montreal, Que., and the harnessing of its electric potential. The elimination of this shipping bottleneck will make the Great Lakes accessible to all but 15% of the world's ocean shipping. The great advantage, however, will not be in letting ocean boats into the continental interior, but in allowing lake boats to get out. In addition, the seaway will:

- (1) carry an estimated 50,000,000 tons of U.S. and Canadian freight annually—five times as much as is carried now and more than the Panama and Suez canals combined;

- (2) provide an additional 1,100,000 h.p. of cheap electric power to the expanding industries of central Canada, and an equal amount to adjacent U.S. industries;

- (3) save an estimated \$200,000,000 in the continent's annual steel bill by bringing low-cost Labrador iron ore to the smelter towns south of Lake Erie (iron ore will be the biggest single cargo carried and is the key to the seaway);

- (4) save Canadian grain farmers an estimated \$20,000,000 annually, on the basis of present crops, by dropping freight rates between the lakehead and Montreal.

But, though the seaway will accentuate the lateral flow of trade that Canada has been trying to foster for almost a century, it cannot hope to compete with the continental barriers that carve up the country into separate geographical units, each isolated by hundreds of miles of wilderness. Canada has been properly compared with an archipelago, a series of islands in which the railways do the work of ocean shipping lanes. This is one of the hard facts of the Canadian economy and one of the great influences on the national character.

The main geographical regions are:

- (1) the Atlantic seaboard, consisting of Newfoundland, Prince Edward Island, Nova Scotia, New Brunswick and the Gaspé peninsula of Quebec, a fishing-farming-lumbering community, surrounded almost entirely by the sea and cut off from central Canada by a 24-hr. train journey through the northern ribs of the Appalachian mountains;

- (2) the St. Lawrence lowlands of southern Quebec and

Ontario, running from a point west of Quebec city to the tip of the Niagara peninsula, a thickly populated hive where three-quarters of Canada's manufacturing is located;

(3) the western plains, separated from the St. Lawrence lowlands by 1,000 mi. of Pre-Cambrian wilderness, and encompassing the southern and settled sections of Manitoba, Saskatchewan and Alberta. Traditionally, the plains economy has been tied almost solely to wheat but recent oil discoveries are bringing rapid changes;

(4) the Pacific coast of British Columbia, a lumbering-fishing-manufacturing community, separated from the plains by a day's train travel through the barrier of the Cordilleran mountain ranges; and

(5) the hinterland, a vast arctic, subarctic and mountain area, comprising the Canadian shield, the Mackenzie and Yukon valleys, the northern extensions of the Cordilleras and the Arctic archipelago. Virtually unpopulated, its main resources are minerals, pulpwood and hydroelectric power, much of it undeveloped.

The Atlantic Seaboard

The corrugated rows of the low Appalachian mountains underline the isolation of the Atlantic provinces. This area of hard crystalline rock, heavily glaciated and eroded to a level of 3,000 or 4,000 ft., makes transportation so costly that one of the two major railways linking the region with central Canada shuns it by travelling through the U.S. All the same, the rounded hills and tattered coastline have given this Atlantic land a rugged beauty that is one of its chief attractions. The Gaspé, with its great 4,000,000-ton rock of Percé, punctured by an enormous needle's eye; the breath-taking Cabot trail that encircles the lovely island of Cape Breton; the picturesque and paintable fishing harbours such as Peggy's Cove, N.S.—all these have become tourist meccas. The deep-sea tuna fishing

TRAWLER FISHING off the Grand Bank, Nfd.

PERCÉ ROCK, Gaspé peninsula, Quebec

off Wedgeport, N.S., and such salmon-stocked rivers as the Restigouche and Miramichi, draw wealthy sportsmen from all over the world. By contrast, the verdant crescent of Prince Edward Island lies in the gulf like a green jewel, "the fairest land that may possibly be seen" as Jacques Cartier, the discoverer of the St. Lawrence, called it more than four centuries ago.

The isolation of the Atlantic provinces from the core of the political unit has helped accentuate a series of distressing problems that have made them the great "have-not" region of Canada. By the time of confederation, the British colonies of Nova Scotia and New Brunswick had reached a golden age of prosperity based on the fruit of forest and sea. The first was a vast fishing port, drawing its wealth from exports of salt cod to the protected markets of the British West Indies. The second was a great lumber camp, building fleets of wooden sailing ships and providing ready-cut cargoes for them. This delicately balanced economy could not long survive a changing world. When Britain abandoned its closed mercantile system for free trade, it opened the West Indies to the cod fishermen of New England, seriously disturbing Nova Scotia's prosperity. At the same time steel and steam worked a revolution in shipping. As wooden sailing ships had been worth more than all other exports put together, New Brunswick suffered. Confederation with Canada failed to give the provinces new markets, for they were too far away: Nova Scotia's coal couldn't compete with coal from Pennsylvania, for example, and the accessible markets for manufactured goods, in neighbouring New England, were barred by tariff walls. These are some of the reasons why the four Atlantic provinces (Newfoundland joined Canada in 1948) have more than 11% of the population of Canada but share in only 4% of the manufacturing and enjoy only 7% of the total personal income of the country.

Generally speaking, these provinces have benefited least from the postwar Canadian boom. But there are some signs that their economic position may improve. The most promising indicators are the new mineral discoveries of New Brunswick and Newfoundland. Three spectacular base metal finds have been made in New Brunswick since 1952, with a proved tonnage of 53,000,000. Mining operations and related chemical-metal industries which could result from these new strikes would help

diversify the province's economy, still based largely on lumber, whose products in 1954 totalled more than half the gross value of all major industries. Newfoundland stands to benefit chiefly from the great iron ore development in Labrador, which forms part of the province. In addition, a bold program has been launched to expand and modernize existing iron and pulp and paper developments on Newfoundland island proper, to assist European manufacturers to start new industries and to overhaul the fishing industry. The latter program, involving radical changes in fish processing, may change the lives of many Newfoundlanders, even to the extent of replacing their tiny villages by larger industrial communities.

The St. Lawrence Lowlands

One of Canada's great problems is the lack of economic balance between its outlying regions and its industrial heartland. Squeezed between the bony ridges of the Appalachians on the southeast and the hard crust of the shield on the northwest is a 600-mi. strip of low country where the wealth of Canada is concentrated. These lowlands consist of the St. Lawrence valley and the Niagara peninsula (a fertile wedge of land bounded on three sides by the lakes and on the north by the shield). It is historic country. Near one end, in the huge industrial city of Montreal, stands the statue of Samuel de Champlain, French Canada's greatest explorer, who first invaded this favoured land. At the other end, not far from Niagara falls, unnumbered honeymooners have stared up at the effigy of General Isaac Brock, whose defense of Queenston heights in 1812 turned the tide of the last American advance into Canada. In between, among the lakes and meadows of the old Indian domain of Huronia, hundreds of thousands of summer campers have paused at the shrine that commemorates the martyrdom of two Jesuit priests among the Iroquois.

Rich in story, central Canada is richer in material wealth. The nation's industrial development began closer to its geographical centre than did that of the U.S., partly because of the water highway, partly because of Niagara falls and its hydroelectric power, partly because of the mineral resources of the nearby shield. The greatest concentration of population is in this area. Six of the country's ten largest cities are jammed into the narrow St. Lawrence strip. The western section, between Oshawa, Ont., and Niagara falls, has a concentration of 185 people to the square mile—equal to that of some of the eastern states of the United States.

The economic life of the strip revolves around two urban centres: Toronto and Montreal. Both have flourished for quite

different reasons. Montreal, the older city, depends on a transcontinental economy. It is a great seaport, the anchor point for the transcontinental railways, the headquarters of the banks and financial institutions, and a centre for heavy industry such as the manufacture of rolling stock, cement and steel, the refining of copper and the milling of flour. Toronto's wealth springs directly from the minerals of the shield. Most Canadian mining corporations have their headquarters in the city, which has become one of the world's leading financial centres.

Ontario's industry is the more diversified: half of Quebec's total output comes from Montreal; two-thirds of Ontario's comes from smaller centres outside Toronto. Factories are springing up so quickly in the Niagara fruit belt that apple, cherry and peach orchards are rapidly being destroyed. Indeed, the industrial expansion of central Canada has transformed both provinces, and its implications are having far-reaching effects on the social and political life of the nation.

The Western Plains

One of the world's principal granaries lies between the Canadian shield on the east and the continental spine on the west. Ten per cent of the world's wheat comes from there. Although only one-fifth of Manitoba, Saskatchewan and Alberta is taken up by the plains (the rest is timber, muskeg, rock, lake and mountain), they are known throughout Canada as the prairie provinces, for the prairies have sustained them. The land stretches off to the horizon, green in the spring, golden in the fall, dead white in the winter, flat and unending under the great bowl of the sky, cut geometrically by dusty roads and speckled with tiny pinpoints of settlement—often no more than a huddle of frame buildings, a few trees and a wind pump. Only three prairie cities have a population of more than 100,000, but there are scores of smaller communities strung along the railway lines like beads on a string. In the 24 hr. that it takes to cross these prairies by train, the traveller is seldom far from the sight of waving wheat.

On the eastern fringes of the plains lie the gnarled rocks, stunted timber and sphagnum mosses of the shield. At the western end the brown foothills of the Alberta ranch country rise up toward the white-plumed Rockies with their twin tourist playgrounds of Banff and Jasper. In between, only a few wooded valleys and hills break the flat monotony. Of these the sinuous, purple-shadowed valley of the Qu'Appelle, angling across half the province of Saskatchewan, is the most beautiful, and the Cypress hills, on the southern border of Alberta and Saskatchewan, the most startling, with their scorpions, vipers and yucca grass.

The Canadian prairies form the bottom of the ancient seas that invaded the continent in prehistoric times. Over these old sea bottoms has been laid a blanket of rich alluvial silt, pushed down from the north by the ice caps of the glacial ages. The silt stores moisture under the snow all winter. The continental climate keeps the plains bathed in sunshine all summer. As a result of these ideal conditions, Canada produces the world's finest hard wheat, and because of mechanization, produces it with surprisingly little man power. Many farmers now live in town houses and move to the wheat fields only for the summer. Saskatchewan, the great wheat province, has been losing population steadily since 1931, although the yield continues to increase.

Traditionally, wheat has been the chief product of the prairies. The annual yield varies from a minimum of 250,000,000 bu. to a maximum of 688,000,000 bu. (a record established in 1952). An average crop is 350,000,000 bu. Because the plains export two-thirds of their wheat the area is more sensitive to the shrinking of foreign markets than any other part of Canada.

CANADA: The Land and the People

The breakdown of the international trading machine in the depression of the 1930s wreaked havoc on the prairies—a havoc made immeasurably worse by the coincidence of history's worst drought. Because it is essentially a one-crop province, Saskatchewan is the most sensitive of all to external forces. Even as late as 1939 one-third of its farmers were on relief. In the two other provinces there has been more diversification. Manitoba is, in some ways, an extension of central Canada, with the large manufacturing and rail centre of Winnipeg and the resources of the Canadian shield. Alberta has always had a healthy ranching and mixed farming income. It also has 47,800,000,000 tons of coal reserves, but the production of this fuel has declined because of the distance from the markets.

This distance has helped make the prairies the other "have-not" region of Canada. In boom times they have enjoyed astonishing prosperity; in bad times the wealthier sections have had to aid them. But now, chiefly because of the oil discoveries since World War II, the prairie economy is undergoing a remarkable transformation. A hint of this came in 1954 when the plains suffered the worst wheat crop in 17 years, coupled with a drop in foreign demands and a lowering in prices. In prewar times this blow would have been little short of catastrophic. In 1954 it resulted only in a minor recession.

Ninety per cent of Canada's oil comes from Alberta. But even in Saskatchewan, which produces only 7%, oil is bringing about a marked change in the economy. In this province of 100,000 farms, petroleum products have recently surpassed wheat flour as the leading manufacture. And although four-fifths of the province's farm income still comes from agriculture, the oil production is increasing rapidly: annual production, which was 2,800,000 bbl. in 1953, jumped to 5,400,000 bbl. in 1954 and was expected to reach 17,400,000 bbl. by 1957. In addition, the province stands to benefit from the uranium discoveries on Athabasca lake, where in late 1955 several large mines were about to come into production. The output was expected to reach an annual \$40,000,000 by 1957, representing 40% of the total Canadian uranium production.

These changes are minor compared with the oil development in neighbouring Alberta, whose Leduc field, discovered in 1947, touched off a tremendous exploration and development program. In 1955 oil companies were spending more than \$1,000,000 a day in a search for oil, and the value of construction directly resulting from the new industry exceeded \$300,000,000.

Twenty years ago, Alberta was considered the poorest investment risk in the British Commonwealth. Today it is the only technically debt-free province in Canada. (At the end of 1954 the provincial debt totalled \$91,000,000; cash reserves \$235,000,000.) This is because the province has retained the mineral rights to most of the oil country, so that the public benefits from oil royalties, rather than private individuals. The gross value of Alberta production has quadrupled since 1939 and the income from oil is now two-fifths of the income from farm products. All this has been accomplished in less than a decade. In 1947 Alberta had 500,000,000 bbl. of proved oil reserves. By 1954 the most conservative figure set the reserves at 2,000,000,000 bbl. The longest pipeline in the world connects the province to the markets of central Canada; another links it to the Pacific. By 1953 oil had replaced gold as the most important mineral in Canada and the nation was ranking seventh among the world's oil producing countries.

The oil industry is still in its infancy. It took the U.S. 42 years to develop its production to Canada's present level. Geologists believe that Canada can eventually expect to produce

CANADA: The Land and the People

OIL DERRICK in a wheat field near Devon, Alta., well 17 of the Leduc oil fields

about half as much oil as its neighbour. The recent discovery of a new field at Pembina, Alta., has brought forth some rosy predictions. The Pembina reserves are not yet calculated but the field is thought to be larger than the two other major fields combined. It was predicted in 1955 that Canadian oil production would more than double in five years to reach 1,000,000 bbl. a day.

None of this takes into account the presence of the strange Athabasca tar sands in northern Alberta. These sands cover 30,000 sq.mi., and the estimates of their oil reserves run from 100,000,000,000 bbl. (45 times that of Canada's present proved liquid reserves) to 300,000,000,000, or almost double the entire liquid reserves of the world. It is believed that this represents the largest remaining source of crude oil—enough to supply the world for a century. But each globule of oil is wrapped around a grain of sand and thus far no economical separation process has been devised. The tar sands remain an undeveloped resource that could some day make Canada the world's greatest oil producer.

The Pacific Coast

Tucked away behind three of the continent's most spectacular mountain ranges lies a temperate corner of civilization caressed by the tepid waters of the Japanese current and protected from Pacific gales by the shielding bulk of Vancouver Island. The greater part of the population of British Columbia, Canada's third largest province, lives there, within 30 mi. of the mouth of the Fraser river. One-third of the people live in the area of Vancouver alone, making it Canada's third largest city. The remainder are on the big island, or scattered thinly through the slender, fertile valleys wedged between the mountain ranges that cover 90% of the province.

The three ranges run diagonally up the length of British Columbia. On the east are the sedimentary crags of the Rockies, world famous for their scenic beauty and luxurious tourist resorts. In the centre lie the Columbian mountains—the Selkirks and the Monashees and farther north the Cariboos and Cassiars. This is an older range, 200 mi. wide, sculptured from

the ancient molten masses that welled from the bowels of the earth. Between it and the Rockies lies the Rocky Mountain Trench, an enormous natural ditch 1,000 mi. long. To the west, so close to the ocean that they often drop sheer to the water's edge, are the granite peaks of the Coastal mountains, also 200 mi. wide and split by fiords dug out ages ago by the glaciers squeezing toward the sea. They have made British Columbia a tourist paradise and given Vancouver one of the loveliest settings on the continent.

British Columbia's structure has made it a province of extremes. Roses bloom on Christmas day in Victoria, which occupies the same climatic zone as New Mexico. But in the mountainous interior, winter temperatures sometimes drop to -70° F. Zeballos, on the west coast of Vancouver Island, has a tropical rainfall of 200 in. a year. But in the arid interior, near Kamloops, where cactus, rattlesnakes and tumbleweed thrive, the annual precipitation is less than 10 in.

The mountains, forest and sea feed the populated corner of the province, making it the wealthiest and most productive section of Canada on a per capita basis. But, although it has enjoyed the greatest population increase of any province (42% in the census decade of 1941-51), it is still largely undeveloped. British Columbia stands third as a Canadian manufacturing province, but lags far behind Ontario and Quebec, producing only 7.8% of the total for the country. It also stands third in mineral production (13%), thanks to the coal of the Rockies, the lead and zinc of the Selkirks, and the gold of the Coastal mountains. The great Sullivan mine, operated by the Consolidated Mining and Smelting company in the Kootenay district, is the largest lead-zinc producer in the world and these metals make up half of the annual \$160,000,000 general output. British Columbia's commercial fisheries, chiefly salmon and halibut, earn the province \$60,000,000 annually and sport fishing is one of its chief tourist attractions. The mountains have given it the second largest hydroelectric potential in Canada, next to Quebec, and most of the power is still unexploited. The most spectacular new project has been that of the Aluminum Company of Canada Limited at Kitimat on the northern coast. By 1970 the settlement, which did not exist in 1953, is expected to reach a population of 50,000. A second power development, harnessing the waters of the upper Yukon, may see another new town of perhaps 15,000 persons north of Kitimat at the head of Taku inlet, where a \$270,000,000 metallurgical industry is envisaged.

But 60% of British Columbia's income still comes from timber. Ninety per cent of the province is suitable for little else. It is these dripping rain forests, thick and almost impenetrable, with their tall stands of Douglas fir, Sitka spruce, red cedar and hemlock, so beautifully captured on canvas by the province's great woman painter, Emily Carr, that have given the Pacific coast its character. Nowhere else in Canada is the growth so lush, and to understand this the tourist has only to drive along the scenic Malahat highway of Vancouver Island near Victoria or plunge deep into the dark heart of Stanley park, a 1,000-ac. stand of original timber within rifle shot of the Vancouver business area.

Only recently has British Columbia realized that its timber can be a vanishing resource. The province is so far from world markets that any drop in quality is likely to bring a slump in sales and profits. Twenty million of its 75,000,000 acres have been logged out or burned over without reforestation. A province-wide conservation plan is now in full swing so that the trees will be harvested on a continuing basis, like the prairie wheat.

CANADA: The Land and the People

The Hinterland

A unique feature of Canada is that its most settled areas are never more than a few hours' drive from the primeval forest or the forlorn frontier. A man can stand on Dufferin terrace above ancient Quebec, or among the Gothic towers of Parliament hill, Ottawa, or on the panorama roof of the Hotel Vancouver and, in Robert W. Service's words, "gaze on naked grandeur." Here is the secret of the country's wealth: the mines of the shield that boomed Toronto, the forests of British Columbia that built Vancouver, the swift rivers of Quebec that enriched Montreal. Here too lies the clue to the small population. In spite of its leagues of golden wheat, Canada contains only half as much arable acreage as France. The untillable hinterland occupies some four-fifths of the nation.

Only the fringe of the hinterland has been developed. The mines of the shield are almost all around its edges. The north remains an unknown quantity, large areas of it scarcely travelled by white men. Much of it will probably stay that way for years to come.

The north is a country of contrasts and extremes. Here, above the 60th parallel of latitude, the temperature can go as high as 103° F., as it has at Fort Smith, N.W. Terr., on the Slave river, or as low as -83° F., as it has at Snag, Yukon, on the Alaska highway. The matted shrubbery of the Klondike is almost tropical in the summer, but the century-old birch trees of the tundra are only a few inches tall. The lake-speckled rockland of the Pre-Cambrian wilderness, the twisted Torngat mountains of Labrador, the bald whalebacks of the Arctic islands, the great web of the Mackenzie delta, the green serpentine lakes of the southern Yukon—all these are part of the hinterland, yet each belongs to a separate world. The conti-

nent's most massive mountains, the Mackenzies, and its tallest mountains, the St. Elias range, and its deepest canyons, on the South Nahanni river, all form part of the Canadian north. This is breath-taking tourist country, but most of it is beyond the finances and energies of the average sight-seer. One of the great scenic drives in North America is the 1,523-mi. motor trip northwest along the Alaska highway from Dawson Creek, B.C., to Fairbanks, Alsk. It crosses 5 mountain ranges, 129 rivers and 8,000 mountain streams. Other northern attractions include the steamboat journey down the Yukon river from Whitehorse to Dawson City and the fishing in northern Saskatchewan where the lake trout run 30 lb. in size. But transportation is the great problem of the hinterland and most visitors are content to visit the southern reaches of the shield, the protected wilderness parks of Ontario, Algonquin, Temagami and Quetico, or the famous ski resorts of the Gatineau and Laurentian hills of Quebec.

There is neither railway nor paved road in the entire Northwest Territories of Canada. North of the 60th parallel goods must be carried by air, or, during the short summer season, by Mackenzie river tugboat. Mineral finds must be spectacular to be profitable. Vast deposits of copper are known to exist along the Arctic coast but they are too far from the markets. One of the world's great lead-zinc deposits lies along the southern shore of Great Slave lake, but, although this has been known for half a century, it has yet to be exploited. The various base metals of the southern Yukon have hardly been charted, let alone mined. Oil is being discovered in increasingly large quantities along the Mackenzie and Liard basins. During World War II there were 61 producing wells near Fort Norman supplying the Canol pipeline that was built at huge expense through the Mackenzie mountains. But peacetime oil production is too costly in the north. As of 1955, Norman Wells was down to one-fifth

MONTREAL, QUE., from a nearby hillside. The wilderness of the hinterland, occupying four-fifths of Canada, is never far from the cities

CANADA: The Land and the People

PADDLE-WHEEL STEAMBOAT in the Yukon

of its former production, supplying only the immediate area. Similarly, the arable land of these two valleys—at least 1,000,000 ac.—has hardly been touched because export costs make large-scale farming prohibitive.

The main resources of the hinterland have been tapped along the lines of the railways and in those sections of the interior where minerals, such as gold and uranium, are extraordinarily rich or easily milled and transported. The storied Klondike has produced upward of \$300,000,000 in placer gold since 1896. It still yields between \$2,000,000 and \$3,000,000 a year. The biggest single source of Canadian silver is nearby, at Keno, Yukon, also a large producer of lead and zinc. Yellowknife, N.W. Terr., on Great Slave lake, the scene of two gold booms in 1938 and 1944-45, has three operating mines including Giant Yellowknife, Canada's third largest. But most gold mining takes place along the railway lines in the Pre-Cambrian hinterland of Quebec and Ontario. The Quebec section of the shield also contains the largest single body of titanium ore in the world.

Four other hinterland resources, iron, uranium, hydroelectric power and pulpwood, have contributed heavily to Canada's postwar prosperity.

Of these pulpwood production is by far the greatest. The gaunt trees that rise from the rocks and muskegs of the shield have given Canada its greatest industry. Pulp and paper production runs to \$1,200,000,000 a year, accounts for 5% of the gross national product, and makes up one-quarter of all exports. The larger part of it is concentrated along the Quebec frontier. It represents that province's leading industry, providing jobs for 42,000 workers. Sixty-five per cent of the wood pulp goes into newsprint to make Canada the world's largest newsprint producer.

The future of the hinterland lies in the development of hydroelectric power. The swift rapids that link the ragged lakes, the spectacular mountain torrents, and the enormous northern rivers are capable of producing 66,000,000 h.p. Next to Norway, Canadians use more electric power per capita than people of any other nation, and they get it cheaper than any other. And although Canada produces more power than any country except the U.S., only one-fifth of the total potential has been developed. However, the nation's installed capacity has been increasing at the rate of 885,000 h.p. a year (1,758,450 h.p. in 1954 alone). Outside of the St. Lawrence seaway development and Niagara falls, where a new generating station was producing an

additional 1,260,000 h.p., these were the major hydro developments of the hinterland as of 1955:

(1) In the Yukon, Northwest Power Industries Ltd. was surveying the potential of the upper Yukon river. Initial plans called for a production of 880,000 h.p. Ultimately as much as 4,300,000 h.p. might be developed by reversing the flow of the famous river and spilling it back over the mountains through tunnels to penstocks near the Pacific coast.

(2) In Labrador, the British-Newfoundland Development company, which had leased a vast acreage for timber, mineral and hydro exploration, was surveying the potential of the Hamilton river, whose Grand falls, almost twice the height of Niagara, were believed capable of producing 3,500,000 h.p.

(3) In northern British Columbia, at Kitimat, the Aluminum Company of Canada had developed 450,000 h.p. by tunneling through the Coastal mountains and tapping the river and lake storage of the interior plateau. Ultimately the company expected to develop 2,000,000 h.p. in this way.

(4) In Quebec, the harnessing of the Bersimis river was expected to produce 450,000 h.p. by 1956 and 1,200,000 h.p. ultimately.

The two most newsworthy postwar developments on the shield have been those of iron and uranium. In 1953, Canada displaced the U.S. as the world's second largest producer of uranium. By 1956 the government expects uranium production to be eight times greater than it was in 1945; by 1957, 12 times greater. By then, the gross annual output should reach \$100,000,000. One mine alone, Algom Uranium, at Blind River, Ont., the scene of the most recent strike, is expected to turn out half of all the uranium produced. The other main mines are at Athabasca lake in northern Saskatchewan and at Great Bear lake on the Arctic circle, the original mine that helped make possible the first atomic bomb.

The postwar iron developments at Steep Rock, Ont., near the northern shore of Lake Superior, and along the Labrador iron trough, are expected to greatly affect the Canadian economy in the coming decades. Canada produced practically no iron before World War II. By the end of 1956, total annual production is expected to reach nearly 18,000,000 tons, and between 30,000,000 and 40,000,000 tons by 1965. This would

TUNNEL THROUGH PORTAL MOUNTAIN, Kitimat, B.C., a project of the Aluminum Company of Canada which would eventually produce 2,000,000 h.p. of hydroelectric energy

SPIRAL TUNNEL of the Canadian Pacific railway near Field, B.C.

rank Canada among the first three or four iron producers in the world and probably make the country the largest iron exporter.

The Railways

The peculiarities of Canadian geography make transportation an integral part of the national fabric. Canada has been called, with some truth, a railway in search of a state, and as one political scientist, Alexander Brady, has pointed out, the unity of the country has depended on railway lines no less than the Roman empire depended on roads. Canada has more miles of railroad per capita than any other country in the world, and its largest railroad, the government-owned Canadian National railways, is the nation's largest corporation and greatest single employer.

To a large extent, the story of Canada over the past century has been a story of railway construction. The country's strengths as well as its weaknesses both spring from this same source. In Canada, railway builders, such as the flamboyant Sir William Van Horne, the U.S.-born architect of the Canadian Pacific railway, have become history-book figures. On the prairies, the railway station with its chalet roof has become as distinctive a piece of architecture as the grain elevator. (The two are invariably found together.) More than half the population lives within sound of a train whistle and this haunting cry, drifting across the land, is a fundamental piece of Canadian music. The two great transcontinental railways enter deeply into the life of the country, for they operate steamships, air lines, freight services, trucks, telegraph stations, real estate firms, meat packing plants, fruit farms, mines, luxury resorts and the best hotels in the nation, so that in towns as small as Saskatoon, Sask., it is possible to order such delicacies as *galantine de capon* from a Lausanne-trained chef.

It was the railways that helped bring about the confederation, and it was the railways that stitched the new nation together. The promise of a railway to the Atlantic coast—the Intercolonial—helped bring the maritime provinces into the union. The promise of a railway to the Pacific—the Canadian

Pacific—secured British Columbia and kept the west from slipping into U.S. hands.

It was only through the building of these and other railways that the nation's resources were disclosed. In 1876, workers on the Intercolonial discovered asbestos on the south shore of the St. Lawrence. Canada became the world's top producer of asbestos. In 1883, workers on the Canadian Pacific discovered nickel on the north shore of Lake Superior, and Canada became the world's top nickel producer. In 1903, workers on the present Ontario Northland railway uncovered the world's richest silver vein at Cobalt and touched off a mining boom that has never been equalled. In the decade that followed, Cobalt produced \$1,000,000,000 worth of silver. The silver mines sparked new discoveries all along the railroad line, including the immensely rich gold camps of Porcupine and Kirkland lake. These provided the capital and experience for all future developments in northern Quebec and Ontario, along the edge of the shield from Labrador to Great Bear lake. The iron mines of Labrador were financed and developed by the Timmins family, whose fortune was made in the Porcupine gold camp 40 years before. The first uranium mine on Great Bear lake was discovered by Gilbert LaBine, who gained his first mining experience in Cobalt.

It was the railways that opened the plains and, in a single decade, 1901-11, settled them with more than a million European immigrants. In that period of unprecedented prosperity, optimism ran so high that the railway builders overextended themselves and left the country a legacy of debt with which it is still saddled. Between 1901 and 1914 railway mileage in Canada jumped from 18,000 to 30,000 mi. By then the government had given the railways \$600,000,000 in subsidy and 32,000,000 ac. of land. Three transcontinental lines spanned the nation and two of them ran side by side through the Rockies. Only a continued boom could support such extravagance; instead, depression came in 1913, followed by war which cut off immigration.

Thus were sown the seeds of Canada's perennial railway dilemma. The bankrupt lines had to be taken over by the government. In the end they all became part of the Canadian

CANADA: The Land and the People

National railway system. They had never made money and, partly because of heavy interest charges on the early debts, they do not make money today. In 1954 every Canadian paid \$2 a year to make up the losses of the Canadian National railways. There have been years when the cost was more than double that amount. The country has long grown used to supporting railroads that cannot show a profit (the Canadian Pacific does show a profit, partly because of extensive land grants originally given it by the government, and partly because it controls other more profitable enterprises such as the Consolidated Mining and Smelting company, the nation's largest producer of lead, zinc, silver and commercial fertilizer).

The railway policy, like the tariff, is maintained in the interests of national unity. Interest charges on debts are only one reason why the lines do not make money; the other reason is the freight rate structure, controlled by the government through its board of transport commissioners. Canadian freight charges bear little relation to mileages travelled or tonnages carried. Raw materials, such as grain, ore and pulpwood, are carried cheaply at the expense of manufactured products. It has been estimated that half of all freight carried is moved at less than cost. Grain, for example, is carried at one-third the actual cost of transportation. The reasons for the policy are self-evident: most raw materials must be transported thousands of miles to ocean ports if interior resources are to be developed; without low freight rates, the transcontinental economy would suffer, for Canada is an export nation and its produce must be sold on world markets at competitive prices.

World Trade

Here, then, is another significant feature of the economy. Because of the small population, Canada can sell only a fraction of its produce domestically. It depends, far more than the U.S., on its export trade. Almost a quarter of the national income comes from exports. With the possible exception of New Zealand, Canada is the greatest trading nation of the world, on a per capita basis.

The dependence on foreign markets is not quite so acute as it was a generation ago. In the late 1920s, 30% of the gross national product was exported. By 1955, because of the rise in

THETFORD ASBESTOS MINES, Quebec, centre of the Canadian industry, largest in the world

CRATED AUTOMOBILE ready for shipment overseas from Saint John, N.B.

population and domestic purchasing power, the figure stood at 23%. (The population rose from 14,000,000 to 15,500,000 between 1951 and 1955.) All the same, a drop in export trade in 1954, due mainly to smaller wheat shipments, was sufficient to cause a minor business recession; and the fact that trade increased again to a record high in the early months of 1955 was taken as an accurate thermometer of improved domestic conditions.

A perennial weakness in Canada's trading system is that its imports have almost always exceeded its exports in value. Another is its dependence on a single large customer, the United States. Traditionally, Britain has been Canada's major market, but this situation has been reversed in recent years as the nation has been drawn more tightly into the dollar orbit. As late as 1947, nearly two-thirds of its exports went overseas, but by 1954 the U.S. was taking 60% of the total and the United Kingdom only 16.7%. In addition, imports from the U.K. were down to 9.6%, while imports from the U.S. had risen to 72% of the total. Canada and its neighbour have become the greatest mutual exchangers of goods and services in the world. The U.S. sends four times as much of its total exports to Canada as it does to its second ranking market. It imports three times as much from Canada as it does from its second ranking supplier. But Canada's trade rests on a precariously narrow base.

Because of Canada's dependence on world trade, it is extraordinarily sensitive to and dependent upon shifts in the international economy. A depression anywhere hits Canada. The world depression of the 1930s struck it a staggering blow, especially in the wheat belt. This is one reason why Canadian statesmen are internationalist in outlook and why Canada has taken such a strong position in various international organizations such as the North Atlantic Treaty alliance. The country needs an integrated international system of trade and finance. A closed system of eco-

CANADA: The Land and the People

conomic communities working around a British or American orbit—or any other orbit—can hurt it badly. Traditionally, Canada has always acted as arbiter between British and U.S. interests, a man-in-the-middle, attempting to reconcile international differences, taking the U.S. side with Britain, the British side with the U.S. Canada's history and geography make this possible; and the restraint that this role imposes on the national temperament has had a considerable effect on the character of its people.

THE PEOPLE

When Sir Wilfrid Laurier, a great Canadian prime minister, remarked half a century ago that Canada as a nation "was the most anomalous that ever existed," the phrase could have applied to the people equally as well as to the land. For Canadians, who seem so uncomplicated to the outsider, are in reality among the world's most complex people. The search for the Canadian character and the Canadian soul has been going on for half a century and is the subject of countless plays, radio talks, novels, magazine articles and weighty books (including one by the present governor general, Vincent Massey), yet it still remains something that almost defies proper definition. One of the reasons is that Canada is a new country, less than a century old politically; until very recently there has not been one Canadian soul, but several. Canadians are only beginning to find themselves as "Canadians" rather than as British, Scottish, French or Ukrainian, and it may well be that future social historians will point to the postwar decades as the era in which Canada finally attained maturity as a nation.

The Pressures of Europe and America

No two Canadians can seem to agree exactly on what a Canadian is, but all agree on what he isn't: a Canadian is not an American. It is this single fact, more than any other, that has determined what kind of people Canadians are. It is a unique situation, this juxtaposition of two enormous nations, with a common tongue, one immensely larger in population and more highly developed than the other. No other nation in the world is subjected to the pressures that the U.S. exerts on Canada. The result has been that Canadians themselves are a unique people.

A second pressure on Canada has been that of the mother country. This, too, has been considerable. It is less than two generations, after all, since Britain was dictating Canada's foreign policies and British ministers were signing treaties and agreements in Canada's name. Thus Canadians find themselves caught between two pincers, one geographical and economic, the other historical and sentimental. The result has not been subjugation but quite the opposite. Canada has managed to keep the U.S. at arm's length politically while slowly prying itself loose from British control.

The story of Canada, then, is the story of a people struggling to be themselves. Three Canadian elections have been fought on this theme. In the 19th century U.S. cries of "manifest destiny" brought from Sir John A. Macdonald, the canny Scot who was Canada's first prime minister, the vote-winning slogan of: "A British subject I was born, a British subject I will die!" In 1911, Sir Wilfrid Laurier, the silver-tongued idol of the nation, went to the country with a plan offering trade reciprocity with the U.S. Reciprocal trade agreements would have certainly raised the Canadians' standard of living, but in Canada the removal of the preferential tariff means for practical purposes the removal of the border. Laurier's political opponents swept him out of office with another slogan: "No

THE AMERICAN LOOK, neon signs at the National exhibition, Toronto, Ont.

truck nor trade with the Yankees." In 1926, the Liberal party, under William Lyon Mackenzie King, the canniest of all Canadian statesmen, was tottering under the worst graft scandal in a generation. But it won an overwhelming vote because King was able to divert public attention from that issue by convincing the electorate that a British-appointed governor general had tried to interfere in Canadian domestic politics. This was the other side of the coin of independence.

The influence of both worlds is to be seen throughout the nation. To a visiting American, the country has a European look. There is hardly a town in English-speaking Canada that does not seem to have its King and Princess streets, its Queen's hotel, its Royal café and its Rex or Imperial theatre. The sovereign's picture hangs everywhere and stares out from the stamps, coins and currency. The mail is Royal and so are the army, navy and air force. The courts are the Queen's courts, the main arteries are King's highways and all public land is Crown land. Large numbers of Canadians speak with English accents, drink tea, watch soccer games, wear British tweeds and woollens and refer to the United Kingdom as "the Old Country." "Chap" is a not uncommon word, and when a Canadian raises a glass of Canadian ale he is apt to use the English expression "Cheers!" British history occupies a more important place in the school curriculum than United States history.

To a visiting European, on the other hand, Canada looks decidedly American. To the unaccustomed ear, the Canadian accent sounds very much like the Yankee twang. Canadians eat with their forks in their right hands, put the salad course before the entree, play baseball on the sandlot and watch the world's series on television. In 1955, Davy Crockett was as much a Canadian hero as an American one. Ma Perkins, Ed Sullivan, Macy's, Joe Palooka, Lucky Strikes, Ted Williams and Pabst Blue Ribbon are all household words in Canada. In fact Canadians know so much about the U.S. that they are often surprised and aggrieved to find that Americans know so much less about Canada.

But Canadians are not Americans any more than they are British. They are separated emotionally from their neighbours by what one historian has called "the mental gulf of revolution." Of all the western hemisphere nations, Canada is the only one that has not cut the European tie. Two invasions from the south have only strengthened the people of the northern half of the continent in their resolve to maintain a slender link with the old world. It was partly fear of United States aggrandizement that forced the provinces of British North

THE PEOPLE, close-ups of the faces of Canada as seen by the outstanding portrait photographer Yousuf Karsh of Ottawa. The pictures on these two pages, as well as several others in this article—notably the three which appear as full pages—were taken by Karsh during a recent tour of Canada. These photographs are a coast-to-coast cross section of what Karsh saw—the bearded Portuguese fisherman of Newfoundland, women and children of St. John, N.B., a Scottish curler of Winnipeg, Man., an oil worker of Alberta, Sikh lumbermen of British Columbia

CANADA: The Land and the People

America to confederate. It was the same fear that spurred the national railway policy. The Canadian Pacific railway was built so close to the border that no U.S. railway could profitably exploit the Canadian west. For the same reason, the easy grade of Yellowhead pass, near Edmonton, Alta., was rejected in favour of a steeper pass closer to the border. Canadians have not balked at paying extra for the privilege of being themselves, and there is little doubt that their standard of living is slightly lower because of high tariffs imposed on such U.S. commodities as electrical appliances and cotton goods (on which the tariff can be as much as 37.5% of sale price).

The Canadian is always conscious of the presence of his powerful neighbour. Most of the movies he sees are made in Hollywood for U.S. audiences, and this includes movies about his own country. Most of the magazines he reads come from the U.S. There are 142,000,000 copies of U.S. consumer magazines sold each year in Canada, against 42,000,000 Canadian consumer magazines. Forty-four per cent of all the programs he sees on the government-owned television service originate in the U.S. Most of his world news comes to him through the eyes of the correspondents of Associated press, which has a reciprocal agreement with the co-operatively owned Canadian press. He is more likely to buy an American book than a Canadian one, and thanks to his radio set, he is often more conscious of the Fourth of July than his own Dominion day, which falls three days earlier. (Canadians make relatively little fuss about Dominion day and, significantly, reserve their fireworks for May 24, a holiday that still marks Queen Victoria's birthday.) The chances are that the food he eats, the car he drives and perhaps even the clothes he wears are U.S. products, produced in Canada by branch factories to escape the tariff wall. Half of all U.S. money directed to manufacturing abroad is invested in Canada, and Canadian firms with U.S. parents account for one-third of the total capital investment in Canadian industry. More than 3,000 Canadian companies are controlled in the U.S. By 1954 the total U.S. investment in Canada was estimated at \$9,500,000,000—representing three-quarters of all foreign capital invested in the country.

If the Canadian sees the U.S. as an enormous, albeit friendly, Goliath, pressing down upon him, he also tends to regard it as a Svengali whose hypnotic attraction is sometimes hard to resist. A perennial Canadian talking point is the "bloodletting" of the nation's most talented men and women, who quit Canada each year for greener economic pastures south of the border. The seriousness of this problem is brought home by the immigration and emigration figures. Between 1848 and 1948, a total of 7,000,000 people came to Canada. In the same period 6,500,000 people left Canada for the U.S. In 1950 there were almost 1,000,000 Canadian-born persons in the U.S., and each year about 30,000 leave Canada to cross the border permanently. Canada has thus become a way point, a stopover on the route between Europe and the U.S. Inevitably it is the working man who arrives; the university graduate who departs. (John W. Dafoe, a Canadian editor, once calculated that 13% of the country's university graduates were in the U.S.) This drain on the country's finest human resources has had its effect on the Canadian character.

In the face of continuing pulls and pressures from the U.S., the Canadian has maintained his individuality only through a singular effort of will. It has required an exertion of a different kind—but one no less stubborn—to effect the peaceable transition, in a single century, from British colony to autonomous nation. (The word "autonomy" is to the Canadian historian what "independence" is to his U.S. colleague.) Canada has had its revolution, but it has been an amicable one. To

CHAMBERS OF THE LEGISLATIVE ASSEMBLY, Victoria, B.C.

achieve self-government and yet remain within the British family, Canada has taken the leading part in shaping the free association of nations known as the British Commonwealth. It has been the chief architect of the commonwealth, whose growth pattern closely parallels Canada's own awkward movements towards self-government.

In Canada, then, the old world is reconciled with the new. Perhaps the best example is the Canadian political system, which is both British and American in structure and concept. The British system of responsible government is to be found in the control of parliament by the cabinet. It is the cabinet in effect, that runs the country. The cabinet is responsible to parliament, which is responsible to the people. The U.S. division between the executive and legislative branches of government is foreign to Canadian politics, where cabinet members are drawn from elected representatives. The prime minister holds such absolute control over the party members that a Canadian political party has been rightly called "a leader with a bunch of followers." It would be unthinkable in Canada for a politician to defy his party chief. But Canada, being a continental nation, has also adopted the federal structure of the U.S., so that a large number of powers (such as those affecting education and roads) are reserved for the ten provinces, each of which has its own parliament. This mingling of American and British principles has brought some curious results. The major Canadian parties carry the traditional British names of Liberal and Conservative (technically, Progressive-Conservative). These titles give little indication of their policies, for, as in the U.S., the parties depend for their support on a coalition of regional groups. On the other hand, the two parliamentary houses seem patterned on U.S. lines: a lower house elected on a population basis, and a senate chosen on a geographical basis. The system, however, is really British: the senators are appointed for life by the party in power and the upper house has no more real power than does the house of lords in Britain. Superimposed upon the whole is the representative of the crown, the governor general, whose duties are now entirely symbolic. Each province has a similar royal representative known as a lieutenant governor.

Few Canadians, however, would discard this royal appendage. Although only 47.7% of the population is British in origin (it was 60% at the time of confederation), the vast proportion of English-speaking Canadians feel some sort of emotional bond with the United Kingdom. They do not feel the same emotion toward the United States—but they like Americans and as a rule feel more comfortable with them. Many also envy Ameri-

CANADA: The Land and the People

cans, but not to the extent of wanting to join them under the same political roof. No government has dared to change the original policy on which the nation was constructed, the policy of an east-west flow of population and commerce, subsidized when necessary by the taxpayer.

Temperamentally a conservative people, Canadians have accepted with few qualms government action in a wide variety of fields which in some quarters of the U.S. would be thought of as radical and socialistic. Though few Canadians think of them in this way, Canada does have a socialized railway system, a socialized air line, a socialized film studio, a socialized central bank, socialized radio and television networks, and a variety of socialized public utilities of which Ontario's Hydro-Electric Power commission is the most outstanding. None of these has been established for doctrinaire reasons. In most instances the government has had to step into the field in the interests of national unity.

The Canadian Broadcasting corporation, for example, with its one French and two English radio networks, was established as a direct counter to the stream of U.S. radio programs pouring across the border. The radio networks and the government-owned television stations, broadcasting programs of a distinctively Canadian nature, are as necessary to the development of the nation as the tariffs and the railways. The Ontario Hydro-Electric Power commission came into being for somewhat similar reasons. Small industries disliked the insecurity of being dependent on U.S. coal, while the general public became alarmed at the thought of private U.S. interests exploiting Niagara falls. Some government enterprises, such as the Canadian Broadcasting corporation, are still matters of controversy in Canada. Others, such as the Hydro, have ceased to be. It is doubtful, however, if any political party would venture to test national sentiment by advocating the abolition of any. A controversial subject in 1955 was the proposed construction of the first natural gas pipeline from Alberta to central Canada over an all-Canadian route. This would mean taking the line for hundreds of unprofitable miles over the Canadian shield, and it would probably require government aid. One of the staunchest advocates of the all-Canadian route was the Hon. C. D. Howe, the U.S.-born minister of trade and commerce. "I'm all for free enterprise," Howe said, "but you can't go without things just because private enterprise won't build it." This fairly sums up the general Canadian attitude. Late in the year it was decided that the pipeline would be built entirely within the Canadian borders, and that the section across northern Ontario would be built by a crown corporation.

French Canada

The insistence on retaining an identity separate from that of either Britain or the U.S., which is a Canadian quality, is even more especially a French Canadian quality, and it is this "French fact of Canada" that contributes to the complexity of the national character. French Canada is a social, cultural and religious island in North America. Far more than their compatriots, *les Canadiens* insist on preserving their own group personality. It is this that has made Canada unlike any other country in the world. It is this that has produced what Arthur Lower, a respected Canadian historian, calls "the bitter agony of Canada."

And agony it is. To the foreign tourist, rural Quebec is all quaintness and charm. The wayside shrines, the twin-spired Lou's Quinze churches with their white and gold interiors, the black- and brown-robed nuns and priests padding silently down the narrow cobbled streets, the ancient seigneuries, the habitant homes, the strip farms, each with its slender ration of river frontage—all these contribute to a sense of the mediaeval that

is unique in North America. But these same scenes serve to remind the English Canadian of the racial and religious schism that has had such a profound effect on the country. More than a century ago, Lord Durham, British governor general and lord high commissioner in Canada, 1838, reported that he was shocked to find "two nations warring in the bosom of a single state." The remark still has truth. French Canada's virile nationalism is apparent to the most casual observer: Quebec has its own plays and novels, its own school of painting, its own movies and magazines—all tinged by its own religion and all couched in its own language which is understood by only 3% of English Canadians. Just as English Canada strives against engulfment by its giant American neighbour, so French Canada strives against a similar engulfment. But because the threat to French Canada is twofold—because it comes from English Canada as well as from the U.S.—the reaction has been far sturdier. This in turn has posed grave problems in Canadian national unity. The nation has as yet no distinctive flag of its own, for example. Canadians of two races have not been able to agree on its design. But Quebec has its own flag.

The key to French Canada is the church, for Quebec is a virtual Roman Catholic theocracy. Long ago the *Canadien* recognized that religion was the mortar which could hold the racial structure together. Thus there is little anticlericalism in the province and almost everybody attends church. The Catholicism of Quebec is peculiarly North American in its char-

CHATEAU FRONTENAC, Quebec city

NARROW STREET of the old town, Quebec city

acter, for it has been heavily laced with the disciplines and the puritanism of the frontier. It places such a stress on modesty that one soap advertisement showing a naked infant bathing had to be retouched to add a bathing suit. U.S. magazines considered suggestive have been confiscated by the police. Films that offend the church have been banned from public and private showings. Street corner preachers who attack the Roman Catholic religion have been jailed and fined for creating a disturbance.

The church enters into almost every phase of life, from the administration of relief to the formation of labour unions. The livelihood and careers of hundreds of thousands of people depend on it, for it controls the hospitals, social services, schools and colleges. But the church exerts its strongest hold on the people through the traditional black-robed figure of the village curé around whom each rural community revolves. He is "father" to his people in fact as well as appellation, and his

advice can be very close to a command.

The emphasis on the spiritual rather than the material is a distinguishing mark of the *Canadien* character. Where the English Canadian tends to put greater emphasis on progress, his French-speaking compatriot lays greater stress on order and stability. Indeed, he tends to regard the aggressiveness of North American commercial life with a certain disdain. Partly because of the church's stress on authority and discipline, labour in Quebec has been traditionally low paid and uncomplaining, and the province, until very recently, has been regarded as an employer's paradise. The Protestant concept of individualism is of course foreign to the *Canadien*. Any change from the familiar disturbs him and thus he tends, far more than the English Canadians, to stay within the confines of his own province, whose English-speaking population has steadily declined. Historically, he has been tied to the soil, the community and the family, which is the most important unit in Quebec social life. The church's emphasis on family and its opposition to birth

CANADA: The Land and the People

control has made for a prolific race. In 1763 when Quebec became British, there were only 60,000 *Canadiens*; today there are 5,000,000 in North America. In spite of heavy immigration by other European races, the proportion of French-speaking Canadians to the rest of Canada is just about what it was at confederation.

Their way of life tends to turn educated *Canadiens* into lawyers, writers, politicians, farmers, priests or scholars rather than scientists, engineers or businessmen. Quebec is overloaded with professional men but very short on technicians. With 30% of the country's population, the *Canadiens* turn out only 2.5% of the chemists and 5% of the civil engineers. Their education simply does not prepare them for these vocations. The intellectuals of French Canada are produced by the 55 classical colleges that enrol 18,000 students each year. These colleges form the link between elementary school and university but there the parallel with North American high schools ends. The course takes eight years and is clerically controlled. All subjects are compulsory and there are no options. The chief subjects are French, English, Latin, Greek, history, geography and philosophy (after St. Thomas Aquinas). There is only minor emphasis on science and mathematics. The literature of Racine and Corneille is studied, but post-revolutionary French authors such as Voltaire and Rousseau get no official sanction. The colleges are not coeducational. Two thousand women attend their own similar institutions.

This helps explain why almost 90% of Quebec industry and manufacturing is owned or controlled by Anglo-Saxons (with a heavy preponderance of Scottish merchants whose traditions go back to the fur trade). It is an unhealthy situation and one the *Canadiens* feel keenly. They see themselves as "hewers of wood and drawers of water" in their own province—a phrase, significantly, also used by English-speaking Canadian leaders when referring to U.S. exploitation of Canadian natural resources.

Quebec's nationalism feeds from many roots, but three of them go deep. These are:

The Conquest by the British: Although it is almost two

centuries since the battle of the plains of Abraham settled the future of the continent, and although they have been allowed to retain (not without some opposition) their own language, culture and religion, the *Canadiens* cannot forget that they are a conquered people—nor can their English-speaking compatriots. This emotional background, producing as it does a persecution and inferiority complex, lies at the root of the differences between the two races.

The Execution of Louis Riel: This high-principled, brilliant but erratic leader of the prairie *métis* (half-French, half-Indian), mounted two rebellions against Canada, in 1869 and 1885, in order to gain recognition for his people. He briefly set up his own government and executed an opponent, Thomas Scott. As a result he was eventually hanged for murder, although there was doubt as to his sanity. The issue was immensely complicated by the fact that Scott, an Ulsterman, was a member of the Catholic-baiting Orange lodge. Protestant Ontario cried for Riel's blood, and the resultant breach with Quebec, where Riel is considered a martyr, has never quite healed.

The Issue of Conscription: The emotional ties that bind the rest of Canada to Europe are absent in Quebec and as a result the province has always been isolationist in its thinking. French Canada's attitude, expressed by the newspaper *La Presse*, at the time of the Boer War, has only modified slightly: "We French Canadians belong to one country: Canada; Canada is for us the whole world; but the English Canadians have two countries, one here and one across the sea." In three wars this sentiment has wracked the nation. The imposition of conscription in 1917 brought French Canada close to open revolt. Statistically, it was a failure. In World War II the government brought in conscription for overseas service in limited form only in the final months of the war. The racial fires thus generated on both sides in periods of high emotion have left their scars.

Yet Canada continues to be British at least partly because of the French whose muskets turned back two invasions from south of the border in 1775 and 1812. The *Canadiens* would

CATHOLIC PRIEST and four members of his congregation standing before the church of Santa Barbara, Uranium City, Sask.

CANADA: The Land and the People

have it no other way, for they are the first to realize that in a United States of North America they would represent only 2% of the population and face inevitable extinction. A century ago, the *Canadien* nationalist, Sir Etienne Pascal Taché, declared that "the last cannon shot for the maintenance of English rule in America will be fired by a French-Canadian hand." It is safe to say that the *Canadiens* trust the English to preserve their traditional rights more than they trust their compatriots. This is why they have never agreed to the severing of the last legal tie with Great Britain: the Canadian constitution as far as it affects provincial powers can still be amended only by the British parliament. With modern France, Quebec has little emotional bond. "It is we, the French of France, and not the English, who are foreigners to them," wrote André Siegfried, a Frenchman and long-time observer of Canada. *Canadiens* feel that they were abandoned by the mother country after the conquest. The break was made complete by the French Revolution.

The deep-seated turmoils of the industrial revolution are only now being felt in Quebec, but there is little question that they will bring changes. The province, two-thirds rural in 1891, still likes to think of itself as an agricultural community, but today it draws two-thirds of its income from manufacturing. In the teeming cities, the church cannot exert the influence to the extent that it does in the small communities. Women are assuming a changing role. The age at which they marry has risen to 25 and the birth rate is starting to drop. There is a steady pressure on the universities and colleges to teach more

science and technology and this pressure has brought results. Labour unrest, once unknown, is on the increase. The Catholic syndicates, formed with the help of Jesuit priests to prevent U.S. unions from organizing Quebec workers, by 1955 claimed 100,000 members.

In recent years Quebec has been the scene of some of the bitterest industrial disputes on the continent.

In one sense, then, Quebec is a province in transition. In a larger sense, however, it has scarcely changed in the 40 yr. since Louis Hémon wrote his classical novel of Quebec farm life, *Maria Chapdelaine*, in which these words appear:

"Concerning ourselves and our destiny, but one duty have we clearly understood: that we should hold fast, should endure. And we have held fast, so that, it may be, many centuries hence the world will look upon us and say: These people are the race that knows not how to perish."

The Canadian Temperament

It is Quebec with its 75 out of 265 seats in parliament that holds the balance of power in Canadian politics. Only on three occasions in the past half century has a political party been able to gain a majority without substantial Quebec support. It has thrown its support to the Liberal party for 60 yr.—and the Liberal party has been in power for all but 15. Thus, as a Canadian historian, W. A. MacIntosh, told an audience in Carnegie hall, New York city, "Every Canadian politician, if he has survived, has learned lessons in moderation. Each political group has learned that there are questions in Canadian

ESKIMO FAMILY of the Northwest Territories

LUMBERJACK SWEEPING LOGS along the Tamacine river, 150 mi. north of Ottawa, a typical spring scene in northern Ontario and Quebec as timber is floated down to pulp mills near the Canadian capital

politics which must be compromised." In Canada, political parties are really coalitions; and the cabinet is always selected on a regional, racial and religious basis. A Canadian prime minister has been described as a man on a tightrope, trying to maintain the delicate balance required of him by the various regional and racial pulls—of which Quebec is the chief but not the only one.

Moderation is thus of necessity a Canadian quality, and this is true in foreign policy as well as domestic affairs. Traditionally, Canada has found itself balanced between the extremes of continentalism and colonialism: its role has always been one of both mediation and interpretation between the U.S. and Britain. (This was especially true in the years between World Wars I and II when, in the absence of the U.S., Canada spoke for North America in the League of Nations.)

If Canadians are a restrained and sober people, these are two of the reasons for it. It is a subject on which they are notably self-conscious and the critical examination of the Canadian group personality has become a leading Canadian pastime. Canadians, says Bruce Hutchison, the journalist, are "the world's unequalled deadpans." Canadians, says Hugh MacLennan, the novelist, "live under the tyranny of the Sunday suit." Canadians, says Arthur Lower, the historian, "are a sober people, uncommunicative and reticent." Canadians, says George Brown, the history professor, "have a genius for indirection." Canadians, says Judith Robinson, the political columnist, "are so busy proving to the English that they are not Yankees and to the Yankees that they are not English that they have no time to be themselves."

Certainly Canadians are known as a relatively unemotional and conservative people, though there have been a regiment of exceptions. Their character has been influenced by their history as well as their geography. They lack the emotional and violent

background of full-scale revolution and civil war that is the heritage of their neighbours. There was no Canadian wild west. The Hudson's Bay company, the British militia, and finally the Northwest Mounted Police kept the peace from Rupert's House to Fort Whoop-up. Moreover, the barrier of the shield kept the prairies from being settled until the American west had filled up and the plains Indians were subdued. Thanks to the Mounties, the Klondike gold rush passed off with hardly a homicide. Men, in fact, were fined for chopping wood in Dawson City on the Sabbath. Placed next to the glowing preamble of the Declaration of Independence, the Canadian constitution is a cold and lifeless document. And the Canadian, when he pays any attention to his national heroes, tends to regard them pretty realistically. John A. Macdonald, the Canadian George Washington, is well known, and none the less admired, as a man who mixed whisky with his drinking water on the public platform and whose administration was tainted with a ruinous public scandal that smacked of bribery.

The racial make-up of the people is another factor tending toward conservatism. The older parts of Canada were settled and influenced by thousands of Tory aristocrats who remained loyal to Britain during the American Revolution and fled north. With these were mingled the Scots who to this day control the financial and banking institutions. Canadians, who have been called with some reason "the Scots of Canada," are a canny breed. Their rate of savings is the highest in the world and most of their money goes into bank deposits and insurance. Canada's 11 chartered banks are Gibaltars of financial solidity. Failures are virtually unknown, but venture capital for new and speculative enterprises is far more difficult to get than in the U.S. Canadians have been accused of failing to exploit their

POTATO FARM, Prince Edward Island

own natural resources and allowing foreigners to do the gambling. (The U.S. oil industry has invested \$780,000,000 in Canada; the Canadian oil industry \$650,000,000.) But it is only fair to point out that a small population cannot always raise the vast sums of money necessary for such huge developments as the Labrador iron mines—an imaginative and hazardous undertaking launched and conceived by Canadians, but about 50% underwritten by United States steel companies and insurance firms.

In assessing the Canadian temperament, the mystic appeal of the hinterland cannot be neglected. The cottage by the lake, the week-end fishing trip, the winter's skiing—all these are part of normal Canadian life. If this has made Canadians less sophisticated than their U.S. neighbours, it has also bestowed upon them what one U.S. observer, William Henry Chamberlin, has called "a sensation of tranquillity." No Canadian can fail to be conscious of his country's northland, hanging like an immense backdrop behind a narrow stage. It is, in the words of André Siegfried, "a window out onto the infinite" and it has given the Canadian some of the serenity of the frontiersman and the pioneer. Arthur Irwin, a Canadian editor and diplomat, expressed the feeling of his countrymen when he said: "Nearly every Canadian at some time in his life has felt the shiver of awe and loneliness which comes to man when he stands alone in the face of untamed nature; and that is one reason why we are a sober and essentially religious people."

The restraint inherent in the Canadian character is noticeable in many walks of the national life: in the singular dullness of Canada's infrequent political conventions; in the reasoned and dispassionate voices of the radio and television news announcers; in the almost total absence of political demagogues; in the strict refusal of the courts to allow "trial by

newspaper"; in the reluctance of public men to be interviewed; and in a general lack of flamboyance in everyday business life.

Regional Disparities

A policy of personal and national moderation is inevitable in a country whose racial makeup and regional structure is as complex as Canada's. For if the U.S. is a melting pot, Canada is a mosaic. Its racial and cultural groups have not yet fused, partly for historical reasons and partly for geographical ones. Once again the presence of the U.S. is a factor here. To each ethnic group, assimilation into the whole has meant conformity with North American, *i.e.* U.S., standards; individuality has been preserved by clinging to old country cultures. If a Nova Scotian Scot holds to his Gaelic tongue or a Manitoba Ukrainian farmwife to her *babushka*, it is to demonstrate their non-Americanism.

And always, of course, the presence of the French-speaking island acts as an example to smaller ethnic bodies. Fortunately for Canada, the geographic divisions do not entirely correspond to the cultural, religious and racial divisions, otherwise any sort of national unity would be impossible.

The Atlantic Provinces

Among Canadians, the maritime peoples—the most British of all (78.8% are of Anglo-Saxon origin)—have rested least easily in confederation. The decline of the Atlantic economy, coinciding as it did with the formation of the new nation, has led the Nova Scotians and their neighbours to blame their ills upon "Upper Canada." Many feel that confederation was thrust upon

CANADA: The Land and the People

them and the idea would almost certainly have been defeated in 1867 if put to a vote. (The union was finally enacted by British statute without final reference back to the colonies.) The Maritimers have always felt that the central provinces cheated them out of their rightful and promised share of the internal commerce of the country.

The insular and peninsular position of the four provinces, reinforced by their age, has helped make the population a cohesive group that often tends to think of itself as maritime before it thinks of itself as Canadian. Nova Scotia, for example, has a far longer history as a British province than as a Canadian one. Talk of secession is still heard along the eastern coast. Indeed, in 1955, the premier of Newfoundland was threatening secession. Newfoundlanders, who joined Canada in 1948 by a vote of 78,000 to 71,000, still talk of Canada as if it were a foreign land. They are an ancient people, their blood undiluted by any recent immigration, their accent distinctive—going back a century or more to Ireland and even longer to Elizabethan days. They live largely in 1,300 fishing villages or “outports” with picturesque names like Bread and Cheese, and White Handkerchief cove, scattered around the 6,000 mi. of deeply indented coastline. They sing sea chanteys and sad ballads of disaster that are said to go back to the 16th century. There are still men among them who never handled money until they reached middle age, for until recent times trade was carried out on the barter system, with codfish the medium of exchange.

The other island province, Prince Edward Island, is an enormous kitchen garden, 85% of it arable land, its people Scottish and English farmers whose pre-revolutionary ancestors were British officers in the American colonies. The character of the Islanders may be gleaned from Lord Dufferin's remark in 1871 that “the islanders have entered Confederation gladly under the impression that the Dominion has been annexed to Prince Edward Island.” Something more can be learned from the words of L. M. Montgomery, whose famous novel *Anne of Green Gables* is set on Prince Edward Island: “We are not hidebound or overly conservative,” she wrote, “but we do not rush madly after new fads and fashions just because they are new. We wait calmly until other parts have tried them out for us and then, if they have stood the test, we adopt them.”

Across Northumberland strait from the little island lie the peninsulas of New Brunswick and Nova Scotia. The former is a province of ancient prides, formed from two stubborn racial groups who have managed to retain their identity in the face of heavy odds. The first group is formed of French-speaking

Acadians, scattered by the British two centuries ago (thus inspiring Longfellow's poem *Evangeline*). With great tenacity they made their way back to their homeland and through *la revanche des berceaux* (“the revenge of the cradles”) have made New Brunswick 38.8% French. The increase has been so rapid that the Acadians may be in the majority by 1975. The other group is formed of descendants of United Empire Loyalists—the Tories who refused to fight in the Revolution and were driven to these harsh shores in 1783. They founded British North America's first incorporated city, Saint John, and helped to give the maritime peoples their basic attitudes of conservatism, respect for law and order, and reverence for Great Britain. The effect of the Loyalists on Canada in general is far out of proportion to their original number.

The Nova Scotians are a mixed group, but the main strain in the province is Scottish. The eastern third, including the island of Cape Breton, is one of the world's great strongholds of Gaelic. Twenty thousand Nova Scotians have a working knowledge of the tongue, names like Antigonish and Pictou abound, and the sound of bagpipes is not uncommon. More fundamental is the Highlanders' fierce belief in the value of education. Five Canadian universities have been founded by Scots and a large number of college presidents in Canada and the U.S. come from Nova Scotia, including the presidents of Canada's two largest universities. Indeed, the sad fact is, as a Nova Scotian supreme court justice has said, “we have always given our children the finest education in Canada, and have never been able to find profitable things for them to do with it at home.” It has been said that Nova Scotia's greatest export is brains. There are as many Nova Scotians living today in New England as there are in their home province. This steady exodus is characteristic of the maritimes. Almost one-eighth of those born on the harsh Atlantic coast have left it for other parts of Canada.

Ontario

The character of Ontario has been largely shaped by two human influences, both of them sternly Puritan in outlook. One was the Orange lodge, the other the Methodist Church. Together, they have given the people of Ontario in general and Toronto in particular the reputation of being stiff-necked, sober, grim and humorless. But Ontario has changed so much in recent years—half of all postwar immigrants have settled there—that the reputation is now largely undeserved.

The Irish poured into Canada by the starving thousands following the potato famine of the 1840s, so that today they comprise the fourth largest racial group in Canada (next to the French, English and Scots). The Ulstermen settled in Ontario where entire counties are almost entirely Northern Irish in make-up. For a century the Orange lodge has been a powerful political pressure group in the province, and much of the bitterness between the races stems from its unrelenting opposition to the Roman Catholic Church. Until recently, city politics in Toronto have been under Orange control, but this influence has waned. As late as 1954, however, the mayor was an Orangeman. It is a measure of Toronto's metamorphosis that in 1955 the mayor was a Jew.

The Methodists (now part of the United Church of Canada) have been an equally potent force both in Ontario and in Canada. The movement spread from the U.S. in the late 18th century but soon broke away from the parent body and by virtue of its rugged individualism and its strong opposition to the Church of England became a potent force in fostering Canadian nationalism. The Methodist circuit riders converted the Loyalist settlers along the southern fringes of the country to their dynamic creed—a mixture of frontier puritanism and social radicalism that forbade smoking, card playing, dancing

MONTREAL, QUE., TAVERN

CANADA: The Land and the People

UKRAINIAN CATHOLIC CHURCH, Edmonton, Alta.

and theatre but stressed Christian reform.

Largely as a result of these Ontario influences, English-speaking Canada remains a puritan country today. All stores and places of entertainment are closed on Sundays and men have been fined for buying a package of cigarettes on the Sabbath (though this technical crime is generally winked at). Liquor laws have recently been relaxed in certain provinces, but they are still strict in comparison with most states of the United States—a direct result of the Methodist temperance movement in the last century. The town of Saskatoon, Sask., is an example of a community founded by Methodists as a temperance colony, just as Salt Lake City, Utah, was founded by Mormons. It is now possible to buy liquor by the glass in parts of Quebec, Ontario and British Columbia, but across vast stretches of Canada it can only be purchased with a permit in government stores. Foreigners find it inexplicable that in a boom town such as Edmonton, Alta., a man may buy a glass of beer in a tavern, but cannot sit with his wife to drink it.

It is the puritan background that has given Toronto, English-speaking Canada's largest city, the sobriquet of "Toronto the Good." The tall spires of Church street, the drawn blinds of Eaton's department store windows on Sundays (the founder was a Methodist), the attacks on "booze" in the *Toronto Star* (whose founder was a Methodist too)—all these seem to confirm the impression. Toronto, the richest city, has long been sneered at by the rest of Canada as the stuffiest. Non-Torontonians like to remark that the city boasts the largest hotel, the tallest skyscraper and the duller Sunday in the British empire. One of the most successful radio plays on the Canadian Broadcasting corporation was a satire entitled "We All Hate Toronto." The governor general, Vincent Massey, himself the scion of a Toronto Methodist family, likes to tell the story of a man who won

a prize in a raffle. First prize was a week in Toronto; second prize was two weeks in Toronto. But Toronto has become a cosmopolitan city and long since outgrown its reputation. On Queen street and Spadina avenue most of the tongues of Europe can now be heard. Cocktail bars are studded about the downtown area (except on Temperance street where, by a Methodist's legacy, no bars may ever be built). And at a recent plebiscite, Torontonians surprised the nation by voting to allow commercial sports on Sunday.

The Prairies

If eastern Canadians seem to be hidebound, starchy, conservative and narrow, the prairie people appear just the opposite. There the streets are wide and so are the horizons. The population is a polyglot. Only 45% are British in background. There are almost 300,000 Germans, 260,000 Ukrainians, 173,000 French, 164,000 Scandinavians, 100,000 Dutch and 92,000 Poles. The minarets of a Mohammedan mosque rise in Edmonton and the stark architecture of a Mormon temple dominates the town of Cardston, Alta. The twin towers of the Greek and Ukrainian orthodox churches are familiar silhouettes on the prairie landscape. Those tightly knit religious groups, the Hutterites, Mennonites and Doukhobors, still band together on community farms. All this is a legacy from the great immigration boom of 1901-1911 when the government set out to stock the empty plains with "men in sheepskin coats."

But the prairie farmer is no European peasant. Instead of the stable mixed farming of the old country he depends on a single boom-and-bust crop: wheat. And unlike his U.S. neighbour to the south, he cannot sell the bulk of his produce on the domestic market. Because his acreage is enormous, his farming is done largely by machines and this has given him an open mind to change. He is a semiradical and a low-tariff man who harbours a distrust of the banks, big business and the eastern industrialists whom he sees as fattening off his labours. This has produced another cleavage in Canada: the split between the agrarian west and the industrial east.

In this context, the unorthodox politics of the plains is un-

SASKATCHEWAN WHEAT FARMER

CANADA: The Land and the People

derstandable. The two old-line national parties have not had a strong foothold in the west since 1921, when the farmers, angered by the collapse of the postwar price level, formed a national Progressive party which was, for a time, the second largest in the federal parliament. At the same time, farmers' governments took over provincially in Alberta and Manitoba. These movements have died away to be replaced by others. Alberta has been governed since 1935 by a Social Credit government which, in doctrine but no longer in practice, is pledged to a program of monetary reform that plays on the farmers' engrained distrust of the banks and "hard" money. In Saskatchewan, the Co-operative Commonwealth Federation, Canada's socialist party, has been in power since 1944. It also forms the opposition party in Manitoba.

The Co-operative Commonwealth Federation party is the application, in the political sphere, of the prairie farmer's deep-seated principle of economic co-operation. The wheat producers have always thrived on co-operatives. Seven out of ten Saskatchewan adults belong to one or more; there are 500 co-operative groceries alone in the province. The Saskatchewan wheat pool, a giant co-operative, is the world's greatest wheat collecting organization; it has 125,000 members, owns 1,200 elevators and ships 150,000,000 bu. of grain annually. In such an atmosphere, the Co-operative Commonwealth Federation flourishes. The party was formed on the prairies in 1932 out of a coalition of agrarian dissenters, former Progressives, Methodist social reformers, left-wing intellectuals, labour union members, Fabians and a smattering of Marxists. Its strength has declined federally, but it is still strong in Saskatchewan although, like the Social Credit party (which started as a radical movement and now campaigns as a defender of individual enterprise against socialism), it has greatly modified its principles.

British Columbia

Although British Columbia is a "have" province, its people also tend to mistrust central Canada. When a British Colum-

bian speaks of "the East," the words carry the same sinister connotation that "Upper Canada" does to a Nova Scotian. There have been occasional threats in British Columbia of secession from the nation, especially in Vancouver Island, which is far bigger than Prince Edward Island; and the question of railway freight rates continues to be a sore point on the Pacific coast, whose residents must pay higher prices for manufactured goods. British Columbians suffer from no sense of inferiority, however—quite the reverse. The magnificent scenery, the clement climate and the abundance of natural resources have convinced them that theirs is the finest habitat in Canada. The population figures tend to bear this out. Almost one-third of British Columbia's population is made up of Canadians who were born elsewhere—250,000 of them came from the prairies alone. Like California, British Columbia has a large proportion of older and retired people. It also has a heavy British element, for the climate is European rather than continental. Indeed, it has a larger proportion of British than Ontario has. But unlike the eastern provinces, whose British strain goes back several generations, the population of British Columbia is made up to a great extent of newcomers from the old country.

For British Columbia is a very new province. Vancouver was only a clearing in the forest at the turn of the century. Now it is Canada's third largest city. The towns have a new look to them. The architecture is contemporary and sometimes startling. Heavily urban in its make-up, the province has some of the most advanced social legislation in Canada. The local pride, the eagerness for sudden change and the distrust of the east have all but wrecked the two old-line parties in British Columbia. The Co-operative Commonwealth Federation has been the official opposition in the legislature for 15 years and only a coalition of the older parties has kept it from taking office. But the old parties were dismembered when the Social Credit movement, hitherto an inconsequential factor in British

HYDROELECTRIC PROJECT IN BRITISH COLUMBIA

CANADA: The Land and the People

Columbia politics, was swept into power in 1952. Actually the Social Credit government follows none of the unorthodox monetary doctrines that gave it a foothold in Alberta during the depression. It is really a conservative regime and many of its members, including the premier and party leader in 1955, W. A. C. Bennett, are former members of the Conservative party. It is perhaps one key to British Columbia's outlook that it prefers a new name for an old principle.

The Years Ahead

In its climb toward economic maturity, Canada is about 30 years behind the U.S. (Manufacturing exceeded agriculture in value in the U.S. in 1890; in Canada in 1920.) In the development of an integrated community it is much farther behind. It seems likely, however, on the basis of postwar expansion, that the speed of both economic exploitation and political integration will accelerate sharply in the next quarter century.

Such enormous resources as the Athabasca tar sands and the Alberta coal fields are still economic question marks that could change the economy drastically. More immediately predictable is the harnessing of water power and the resultant growth of electrochemical and electrometallurgical industries around the fringe of the hinterland.

Vast sections of Canada will never support a large population, but the next 25 years will almost certainly see the frontier inching northward, with two important bulges: one in the vicinity of the northern Ontario clay belt, an arable area south of James bay, the other north of Edmonton in the direction of the Peace river and the fertile Mackenzie and Liard valleys. For practical purposes Canada will remain a linear country, with the bulk of the population strung out along the border.

By 1955, the most cautious bankers and government statisticians were predicting a population of 23,500,000 in two decades, and a gross national product of \$55,000,000,000—more than double that of 1955. This would mean a higher standard of living and a better balanced economy for Canadians—a greater consumption of agricultural products domestically, an increase in the proportion of secondary industry and a proportionate increase in exports and imports. (If the gross national product rises 100%, it is expected that exports will increase by 65% and imports by 50%.)

Thus, barring unforeseen alarms, the material promise of the nation seems well on the way to fulfilment. Canadians themselves take this for granted. The more thoughtful among them are more concerned with the future of the national soul. Are Canadians developing a sense of identity—a common character that distinguishes them from others? This is a question that any Canadian will find difficult to answer, though some have attempted to answer it. Vincent Massey, the first native Canadian governor general, has written with pride that it was possible to distinguish Canadian soldiers during the war by their bearing alone. Lister Sinclair, a Canadian playwright, poet and critic, feels there is a distinguishable Canadian idiom to be found in the work of the newer novelists and poets. These are

CHILDREN OF ST. JOHN'S, NFD.

personal impressions, but the fact that they are widely discussed in Canada is significant. There are other straws in the wind: the national pride engendered by the nation's wartime effort and postwar boom, the swiftness of transcontinental travel that has tied the regions more closely together, the gypsy-like shifting about that is having its effect on ethnic disparities, the industrial revolution that is changing the face of Quebec. But perhaps the greatest influence on the Canadian character is time itself—the slow simmering of the various ingredients in the Canadian broth over the decades. Canada is less than 90 years old, but already it seems to be on the threshold of that destiny which a great Canadian statesman, Edward Blake, saw for it when in 1892 he wrote these words to Sir Wilfrid Laurier:

"It has seemed to me that, by the courses which of late years Canadian politics have taken, we have been drifting nearer to political union with the States. . . .

"The great Republic stands today in the front rank among the nations . . . and to join them on fair and equal terms would be for any Province of this Dependency no ignoble lot.

"Nevertheless this is not the goal at which I aim. I cling to the hope of a higher though more arduous destiny for the great Dominion. I look for the regeneration of my own country. I cling to the hope that—sooner or later, and rather soon than late—there may be born into the world an independent Canadian Commonwealth; nerving itself to solve, after its own fashion, the many racial and religious, moral and political, economic and material problems which confront us; united by enduring links of kinship and sympathy, hope and admiration, with three of the leading nations of the world; advancing, more effectively than now, our own varied interests as well as the true welfare of the old land, the proud mother of free nations as well as free parliaments; and enjoying under arrangements which a wise and liberal statesmanship on both sides of the Line and the Atlantic may mature, bright prospects of unbroken peace and absolute security, together with the fullest freedom of trade and the wide measure of intercourse compatible with the provisions of our revenue and the preservation of our autonomy.

"May these things be!"

Dawn of the Space Age

By **ROBERT C. TRUAX**, *Commander, U.S.N.*

Introduction by **WILLY LEY**

WHEN, some three decades ago, the first public debates about the technology of rocket research and the problems of space travel took place, all the emphasis was on what are now proved points. The pioneers of the new sciences had to assure their audiences that recoil would work in airless space and that there was no conceivable reason why liquid fuel rockets could not be large in size, in fact that there was no theoretical upper size limit to a liquid fuel rocket.

In regard to the second point, the idea of 10- and 15-ton rocket missiles is commonplace by now and if an announcement about 50- or 80-ton rockets were to come over the wire services nobody would be greatly surprised. And after a 50-ton rocket has become commonplace a 500-ton rocket would not be much of a surprise.

In regard to the first point, all one has to do now is to quote the famous "Bumper" shot of 1949 in which a WAC Corporal rocket lifted itself out of the nose of a V-2 rocket to climb to a maximum height of 250 mi. The point is that the WAC Corporal freed itself from its carrier 20 mi. above the take-off site and at that height more than 98% of the total mass of the atmosphere was already below. The rocket began burning in what was to all intents and purposes empty space and it finished its climb at a height where there are fewer air molecules per cubic foot than in a vacuum tube on the ground. It is, in general, not very well realized how close we are to "space," how

tenuous the atmospheric layer really is. At sea level there are 760 millimeters of mercury of air pressure, while one and a quarter miles up the pressure drops to 596 mm. At twice that height it is down to 460 mm., at five miles to 267 mm. and at ten miles to less than 90 mm. And at 100 miles above the earth even the largest rocket finds less air resistance than is encountered by a pack of cigarettes falling off a desk.

A very similar picture presents itself when we consider the velocities needed to reach such high altitudes. A rocket climbing with a velocity of six-tenths of a mile per second at the instant its fuel supply is exhausted will ultimately reach an altitude of about 30 mi. above this so-called cutoff point. Doubling the velocity will not just double the altitude but will result in its reaching a peak altitude of 126 mi. Doubling the velocity again will lift it to more than 500 mi. The latter height has not been actually reached so far, but could be reached any day somebody in authority decides that it should be done.

But while the new science of space travel has in only three decades made strides which would once have been considered fantastic, it has also acquired an extraordinary complexity. Almost all the other sciences, from astronomy to zoology, are somehow involved, especially mathematics, metallurgy, mechanical engineering and medicine. It is because of this complexity that a simple or short explanation of rocketry and space travel is no longer possible. But it is also due to this complexity that a further rapid growth and great accomplishments can be readily predicted.

DAWN OF THE SPACE AGE*

THE 20th century has been noteworthy for many great achievements in the field of physical science. The first half saw, to name only a few of the more spectacular developments, the beginning of mechanical flight, the revolutionary theory of relativity and the large-scale release of energy from within the atomic nucleus.

There are indications that the second half of the century might see the realization of a dream almost as old as that of flight through the air—that is, flight through the reaches of airless space. The accelerating pace of technology seems to assure that within this period there might be at least one-way flights to the moon by unmanned rockets. The trend of events in the next few years may determine the rate of progress toward further achievements in this direction.

Space Flight an Old Dream

The dream of flight to the sun, moon and planets began

*The opinions contained in this article are those of the author and do not necessarily represent those of the U.S. Department of the Navy or the naval service at large.

almost as soon as men realized that these objects were reasonably large material bodies, rather than mere spots of light affixed to the dome of the sky. One of the earliest stories on record is that of Daedalus and Icarus, of early Greek mythology. The pair fashioned for themselves wings of wax and feathers. Icarus, disobeying the instructions of his father, Daedalus, flew too close to the sun, which melted the wax, and Icarus was pitched headlong into the Aegean sea.

COMMANDER TRUAX is a graduate of the U.S. Naval Academy, class of 1939. During most of his naval career he has been connected, in one capacity or another, with the development and design of rockets and guided missiles. In 1951 he advocated formation within the American Rocket Society of a Space Flight Committee, which later submitted recommendations to the National Science Foundation that were instrumental in bringing about the project to launch satellites to circle the earth.

MR. LEY is well known as an author and lecturer on scientific subjects, especially rockets and space travel. He has been a research rocket engineer, science editor, and consultant adviser on television, notably for Walt Disney's "Land of Tomorrow" program.

WHAT IS A ROCKET?

All propulsive devices must accelerate some mass in order to operate. A rocket is a propulsive device which carries along with it the entire mass to be accelerated. It differs in this respect from the ramjet and the turbojet, and from the more familiar internal-combustion engine of an automobile, for these suck in atmospheric air to mix with their fuel.

There are two main types of rockets—those which use solid propellants, and those which use liquid propellants. The liquid-propellant type may be further divided into the pump-fed and the pressure-fed systems, depending on the means used to force the propellants from the storage tanks into the combustion chamber. The three rocket propulsion systems are shown below.

SOLID PROPELLANT ENGINE

LIQUID PROPELLANT ENGINE PRESSURIZED SYSTEM

LIQUID PROPELLANT ENGINE TURBOPUMP SYSTEM

Fig. 1.—Types of rocket propulsion systems

Such stories of flying from the earth to the heavenly bodies were fairly common as long as men did not realize that the atmosphere does not extend throughout the entire intervening distance. It was not until the days of Galileo and Kepler that a true appreciation was gained of the enormous distances involved. At approximately the same time it became known that most of the distance to be travelled lies through an almost perfect vacuum. Thereafter, tellers of interplanetary adventure stories were somewhat handicapped by the lack of a suitable means to transport their travellers through the vacuum of space. It was not until the early 1900s that it was demonstrated that the rocket, a device known since the 13th century, was at least theoretically capable of operating in the absence of any surrounding medium. It was shown that the rocket could not only operate in a vacuum, but that it could also conceivably attain the enormous speeds required to traverse the vast celestial distances in reasonable periods of time.

This growing realization that interplanetary flight might be within the realm of possibility fired the imaginations of many

men. Societies for the promotion of space travel were formed in several countries. The problems were discussed publicly by serious scientists. An entire new body of fiction grew up around the idea. The impetus given rocket development by military demands of World War II brought a new sense of imminence to this old dream.

Today there is an international organization devoted to the promotion of space travel, and space flight societies exist in 23 nations of the world. In Dec. 1954 the American Rocket society requested the National Science foundation to undertake a study of the utility of a vehicle revolving endlessly about the earth, high above the atmosphere, as an artificial satellite.

On July 29, 1955, an announcement was made from the White House that the United States would undertake to create a small satellite of this type. The announcement was made jointly by the National Academy of Sciences and the National Science foundation.

The purpose of the satellite would be to obtain scientific data in connection with the International Geophysical Year 1957-58. The satellite would probably be about the size and shape of a basketball. It would be placed in its orbit in 1957. The exact size and design of the satellite had not been determined at the time of the announcement. The possibility existed that more than one of these devices would be fired out into space. It seemed certain from the official disclosure that a serious attempt would be made to place in the orbiting body instruments capable of measuring various types of radiation and transmitting these measurements by radio to the ground.

It was disclosed in October that development of the rockets for placing the satellite in its orbit would be supervised by the U.S. navy. The vehicles were to be assembled by the Glenn L. Martin Co. with the assistance of several other contractors.

Regardless of the exact size or degree of instrumentation of the satellite, it became clear in 1955 that both the feasibility and utility of such a device had been established. The initial step in the conquest of space was about to be taken.

The time would seem ripe for a look at the past, to see what progress has been made, in theory and experiment, toward the conquest of space, and then to hazard a prediction as to possible future developments.

Newton Lays the Foundation

Sir Isaac Newton, in his *Principia*, published in 1687, formulated all the laws necessary for an understanding of both the propulsion and navigation problems of space flight. He also provided the mathematical tools by which these laws could be applied to obtain quantitative answers. More than 200 years elapsed, however, before these laws and tools were applied specifically to the problems of interplanetary travel. Even today many false notions are commonly held regarding rocket propulsion and space flight. Among these are the widespread beliefs that the rocket operates by "pushing against the air," and that it is possible to lift something high enough to be "beyond the pull of gravity."

If we consider the laws of motion expressed by Newton, we quickly see that the presence or absence of a surrounding medium can have only a secondary effect on the ability of a rocket to propel itself. The basic law of propulsion is Newton's second law of motion, which may be expressed by the equation:

$$F = \frac{d(MC)}{dt}$$

which merely says that if a force, F , is applied to any body, it will produce in that body a change of momentum, $d(MC)$, which is proportional to the length of time the force acts. Or, stated conversely, whenever there is produced a change of

Dawn of the Space Age

momentum, a force must have been applied to do so. Since momentum is defined as the product of mass, M , times velocity, C , we see that the second law of Newton requires that whenever the velocity of a given mass is changed, there must be a definite force acting for the duration of the change of velocity.

Newton's third law of motion states that for any *action*, there is an equal and opposite *reaction*. This is equivalent to saying that forces always act in pairs. If there is one force changing the momentum of a mass, there must be another equal force, acting in the opposite direction (which is changing the momentum of another mass).

These are the two basic laws of rocket motion. While the rocket is operating, a certain mass of propellant each second, initially at rest with respect to the rocket, is being changed into a gas and expelled out of the nozzle at high velocity. A force is required to effect this change of velocity, and a reactive force is required to act against the rocket. It further follows that the force acting against the rocket will produce a change in velocity of the rocket, opposite in direction to that produced in the rocket's exhaust.

The explanation of why a rocket operates may also be expressed in terms of familiar everyday experiences. Since "force" and "pressure" are more familiar concepts than abstractions like "rate of change of momentum," the following explanation might have more meaning to many readers. Visualize (Fig. 2) a container, holding a gas under pressure which is greater than the pressure of the air outside it. This gas pressure is exerted against the container equally in all directions. If, however, one side of the container is suddenly punctured, with a hole having an area "A," then the force which acted on that area will disappear. During the interval required for the internal pressure to drop to that existing outside, the pressure acting on an equivalent area at the opposite side of the container will constitute an unbalanced force, in the direction indicated.

It may be seen that the presence or absence of an outside medium affects the situation only as it controls the length of time required for the container pressure to reach that existing outside. If this outside pressure very nearly equals the inside pressure, equilibrium will obviously be reached very quickly, whereas if there is a complete vacuum outside, the process will take longer. This is the principal effect of an external medium on the thrust of a rocket. The *nature* of the medium has no effect. The effect of its *pressure*, however, is such that the lower the pressure, the *greater* the propelling force or thrust.

Thus, the rocket actually operates somewhat better in a perfect vacuum than it does in the air, under atmospheric pressure, rather than the reverse. For rockets of contemporary design, this improvement is in the neighbourhood of 15%.

It is sometimes difficult to visualize the rocket exhaust as possessing any significant mass. A high-performance rocket is more than half propellant, however, and all this material is expelled through the exhaust during the burning period. For the German V-2 rocket of World War II this amounted to nearly 300 lb. *per second*, and the velocity of this mass was changed from rest to more than 6,000 ft. per second.

To navigate through space it is necessary to have an engine that will operate in a vacuum, and the rocket is the only propulsive device that will meet this requirement. We have seen that in order to produce a propulsive force, it is necessary to effect a change in momentum of some mass. In space, the only mass available is part of the vehicle to be propelled. If we expel some of this mass, we have, by definition, a rocket.

The fact that a rocket will work in a vacuum, however, does not automatically solve the propulsion problem for travel to the moon or planets. Newton, who gave us the principles by which we might conceivably propel ourselves into space, also enunciated the law which prevents us from going where we please among the heavenly bodies. This is, of course, the law of gravitation. By this law, every bit of matter in the universe attracts every other bit of matter in the universe with a force which is proportional to the product of the masses involved and inversely proportional to the square of the distance between their centres of mass. Expressed mathematically for two masses, m_1 and m_2 , separated by a distance, S , the force is:

$$F = k \frac{m_1 m_2}{S^2}$$

where k is a universal gravitational constant.

From this formula we see the fallacy involved in attempting to get "above" the pull of gravity. The force of gravity, F , never becomes zero as long as m_1 or m_2 is not zero, or S is not infinite. It simply decreases, rapidly at first, then more and more slowly, becoming very small at only comparatively short distances from the earth. For example, at a height of 36,000 mi., or less than one-sixth of the distance to the moon, the force of the earth's gravity has dropped to 1% of its sea level value. (Fig. 3 on following page.)

Although the gravitational force exerted by one body upon another never entirely disappears, no matter how far apart the bodies may be, the amount of *energy* required to separate them completely and forever is finite and may easily be calculated. This fact is of interest in the problem of escape from the earth by rocket, for once we have stored this required amount of relative kinetic energy in any vehicle by giving it a certain amount of speed upward, it can continue to coast away from the earth forever. It would be, in fact, much more economical to free a spaceship from the pull of gravity by this method than to impart some lower initial velocity and then continuously to supply just enough thrust to maintain this speed against the pull of the earth. For this reason, all departures from the earth are likely to begin with a comparatively rapid acceleration to maximum speed, followed by a long coasting period. The "velocity of escape" required to project a spaceship to infinity amounts to about 7 mi. a second, or about 25,000 mi. per hour. To escape from bodies other than the earth, different velocities are required. Table I lists the calculated velocities of escape for several bodies of interest.

If there is imparted to a rocket a velocity less than that required to escape from the earth's gravity, it will travel in an ellipse, with the centre of the earth at one focus. If the flight

Fig. 2.—Diagram illustrating the forces operating in a rocket

Dawn of the Space Age

Table I.—Velocities of Escape for Various Bodies

Body	Velocity of escape	
	mi. per hr.	ft. per sec.
Earth	25,100	36,900
Moon	5,280	7,750
Mars	11,200	16,360
Venus	22,700	33,200
Jupiter	133,000	195,000

path, at the instant propulsion ceases, makes an angle with the earth's surface, the rocket may strike the earth on its return trip, as in path A of Figure 4. If, however, the path is parallel to the earth's surface at the instant of burnout, and if the velocity exceeds a certain minimum value, the rocket on its return trip will pass through the point where burnout took place. It will be headed in the same direction and travelling with the same speed that it had in the beginning, as shown in path B. Neglecting disturbances caused by the moon, sun or other bodies, and assuming that the point where burnout took place is well above the atmosphere, it will continue in this orbit forever.

If the rocket, projected tangentially as in the foregoing example, has a particular velocity at burnout, which depends on its height at that instant, it will describe an orbit around the earth which is a special case of an ellipse, namely, a circle. This circular velocity is that velocity at which the centrifugal force exerted on the rocket, as a result of the curvature of its orbit, just counterbalances the rocket's weight. Fig. 5 shows how the required velocity varies with the altitude of the orbit. Also shown are the corresponding periods of revolution. These circular orbits are of special importance, as will be shown later.

It is apparent that the velocity required for even the rather modest space voyage, circumnavigation of the globe, is very large compared with that of the fastest aeroplane. It is very high compared with that of a rifle bullet. Even though we have

discovered that a rocket will produce thrust in a vacuum, what is the basis for believing that these enormous speeds are really attainable?

How Fast Can a Rocket Go?

In order to understand the answer to this question, it is necessary to examine the basic equation of motion of a rocket. If we ignore the effect of gravity, at least for the moment, and assume the exhaust velocity of the gases to be a constant, we can develop the very simple equation for the velocity attained by a rocket:

$$v = C \log_e \frac{M_0}{M}$$

where v is the velocity at burnout, C the exhaust velocity relative to the rocket, and M_0 and M are the initial and final masses of the rocket respectively. \log_e signifies the natural logarithm. This equation is derived directly from Newton's second and third laws of motion by taking into account the varying mass of the rocket during the burning period. Expressed in words, the equation says that the velocity attained by a rocket is equal to the velocity of the rocket exhaust multiplied by the natural logarithm of the ratio of the starting mass to the final mass.

For any desired rocket velocity the ratio of initial to final weights required may be calculated, if the value of C is known. Fortunately, the exhaust velocity can be determined rather easily from thermochemical and thermodynamic considerations. The calculations are somewhat too involved to be discussed here, but several generalizations may be drawn from the formulas. The primary factors tending to increase the exhaust velocity are: low molecular weight of the gases comprising the jet, high initial gas temperature (*i.e.*, very energetic propellants) and a large ratio of initial to final pressure. Table II

shows a listing of the exhaust velocities obtainable with several representative propellant combinations. Also listed are the combustion temperatures, and the specific gravities for the particular ratio of oxidizer to fuel indicated.

Examination of the table shows that the highest exhaust velocity of all is obtained with liquid fluorine and liquid hydrogen. The inclination to specify this combination for our space flight endeavours is certainly very great. It may also be seen, however, that the specific gravity of this combination is very low. The tanks to contain a given weight of fluorine and hydrogen would have to be more than twice as large as those to contain the same weight of liquid oxygen and alcohol. As a result the tanks would undoubtedly be considerably heavier. Therefore, much of what is gained in increased jet velocity is lost in decreased mass ratio. Another drawback is that liquid fluorine and liquid hydrogen have very low boiling points.

Fig. 3.—Variation of the force of gravity with distance from the earth

Dawn of the Space Age

Table II.—Properties of Various Possible Rocket Engine Propellant Combinations

Propellant combination	Mixture ratio oxidizer to fuel	Exhaust velocity (ft. per sec.)	Combustion temp. °F.	Specific gravity
Oxygen-alcohol	1.5	7,800	5297	.97
Oxygen-gasoline	2.26	8,100	5660	.995
Oxygen-hydrazine83	8,460	5382	1.065
Oxygen-hydrogen	2.89	11,100	3886	.23
Fluorine-hydrogen	9.42	11,900	8072	.457
Fluorine-hydrazine	1.98	9,560	7692	1.07

Nitric acid-aniline	3.00	7,150	5067	1.39
Nitric acid-hydrazine	1.16	7,800	4728	1.25
Hydrogen peroxide-gasoline	5.10	7,400	4095	1.20
Hydrogen peroxide-hydrazine	1.69	7,700	4200	1.22
Hydrogen peroxide-nitromethane42	7,500	4719	1.20

NOTE: Table II is based on expansion from a combustion chamber pressure of 300 lb. per square inch absolute to 14.7 lb. per square inch.

Liquid hydrogen boils at -423° F. and liquid fluorine at -306° F. Add to the low temperature problems the facts that fluorine is extremely corrosive and that hydrogen is very inflammable, and you have powerful deterrents to their use as propellants. Furthermore, because of the very high combustion temperatures, some engine efficiency would have to be sacrificed to attain proper engine cooling.

It is difficult to find a really happy choice of propellants, for each step down the performance ladder brings partial compensation in terms of density, handling qualities, lower cost or other advantages. The final choice would have to be made on the basis of expediency.

Let us assume, to make the problem concrete, that we decide to use liquid oxygen and hydrazine as propellants, and that we obtain the full theoretical exhaust velocity shown, 8,460 ft. per second. Disregarding the velocity loss due to gravity during the burning period, we find that to attain enough speed for a low altitude orbit (200 mi.), the required mass ratio is about 20. That is, the loaded rocket at the instant of take-off must weigh about 20 times as much as it does at burnout; i.e., 95% of the rocket must be fuel, and only 5% is available for pay load, structure and all other items.

Suppose now that we wish to escape from the earth completely, what mass ratio will be required? Remembering that for this end the rocket must attain a speed of nearly 37,000 ft. per second, we find that a mass ratio of 76 is needed. This means that only 1.3% of the gross weight of the rocket is available for pay load and structure, an obvious impossibility. In fact, it is also very probably impossible to build a rocket having the mass ratio of 20 required for a circular orbit. What then is the source of the engineer's optimism that this obstacle can be overcome?

The answer lies in what is known as the step-rocket principle. If, for example, it is

found that a rocket can be built which will carry a pay load equal to 10% of its gross weight, for an over-all mass ratio of five, such a rocket will attain a speed, calculating as before, equal to 1.6 times the speed of its exhaust. For the exhaust velocity assumed, this would be 13,500 ft. per second. Now suppose that as a pay load for this rocket, another smaller rocket is used, having the same mass ratio and exhaust velocity. Suppose further that this combination, or two-step rocket, is set to fire in such a way that at the instant the larger stage burns out, the smaller stage is ignited. The velocities will then be additive, and the smaller rocket, at burnout, will be travelling at twice 13,500, or 27,000 ft. per second. Already more than enough speed has been attained to establish a permanent orbit. If a larger rocket of similar proportions were added to the two-stage combination, to carry the first two rockets as pay load, the final velocity would be three times 13,500 or 40,500 ft. per second. Comparing this latter speed with that required to escape from the earth, it is obviously more than adequate. When we make a deduction for air resistance, and the fact that the rocket must support its own weight during the propulsion period, the velocity attained would be reduced to approximately the 37,000 ft. per second required.

To summarize up to this point, it may be said that the essence of the problem of space flight is the attainment of very high velocities. In order to get such high speeds, it is evident that the jet (or exhaust) velocity must be as high as possible, and the mass ratio must be made very great, probably through the use of the step-rocket principle. Before we proceed to examine where rocket development stands at the present time, and to attain these tremendous speeds in practice, it will be instructive to examine some of the experimental stepping stones which have laid the foundation for our present technology.

Dawn of the Space Age

ROBERT H. GODDARD, 1882-1945

Above: Goddard with his rocket in his shop at Roswell, N.M., about 1938

Left: The first liquid-propellant rocket, developed by Goddard. Shown in its launching frame, the liquid oxygen-gasoline rocket was fired March 16, 1926, at Auburn, Mass.

Above: Complete rocket in Goddard's Roswell laboratory, Feb. 1940. The picture was made from two photographs placed in juxtaposition to show the rocket's entire length of 21-22 ft.

Right: The Goddard rocket of 1940-41, with covering removed to show interior mechanisms. This rocket is now in the Smithsonian institution, Washington, D.C.

Early Rocket History

Heron (or Hero) of Alexandria, a Greek geometer and writer who is believed to have lived some time between 150 B.C. and 250 A.D., described in a book entitled *Pneumatica* a toy which utilized the rocket principle. This device consisted of a hollow metal sphere, supported on tubular pivots. Attached to opposite sides of the sphere were bent tubes. Steam from a water boiler located underneath the sphere was led into the sphere through the pivots. The steam, escaping through the bent tubes, caused the sphere to rotate in much the same manner as does the common rotary garden sprinkler. Although this device simply went around and around, it was truly an application of the rocket principle. (Fig. 6.)

The Chinese first invented gunpowder, and by 1225 A.D. they had applied it to rocket propulsion. History records the use of rockets against the Mongols in the siege of Kai-feng in 1232. Knowledge of the rocket and of its application to warfare soon spread to the western world.

In 1805, Sir William Congreve equipped the black powder rocket with an iron case, which improved its performance considerably. For many years thereafter, the rocket gave strong competition to the cannon for military bombardment, but by 1850 its use had been almost completely abandoned because of improvements in artillery. From 1850 until World War II the rocket was used almost exclusively for pyrotechnics, although a type was made for throwing lines to vessels in distress.

Goddard Ushers in the Modern Era

Beginning in 1908, Robert H. Goddard, at Worcester (Mass.) Polytechnic institute, began experiments destined greatly to improve the performance of the rocket. Prior to this time, the exhaust velocity of the powder rocket was only about 1,000 ft. per second, and its reliability very poor.

Fig. 5.—Variation of circular velocity with altitude of orbit; also the corresponding periods of revolution

Fig. 6.—Hero's engine (from *Encyclopædia Britannica*, 8th ed., 1853-1860)

In 1918 and 1919, Goddard conducted experiments with smokeless powder rockets. In these tests, in which he used very strong steel chambers, he obtained exhaust velocities up to 8,000 ft. per second. However, the great weight of the chambers and the small amount of powder that could be contained in them led him to investigate a reloading device. Such a mechanism would permit the bulk of the propellant to be carried in a lightweight container, reserving the heavy steel chamber for that portion of the propellant actually undergoing combustion.

The solid propellant reloading mechanism proved too heavy and clumsy, however, and consequently it was not long before Goddard abandoned solid propellants in favour of liquid propellants, which could be transferred from lightweight, lower pressure tanks to the high pressure combustion chamber by means of simple centrifugal pumps. The requirement for high mass ratios has led space flight enthusiasts to consider the liquid propellant rocket almost exclusively as the prime power plant for their purpose. It is with this particular type of rocket that most of the remainder of the discussion will deal. In 1926, Goddard flew the world's first liquid propellant rocket. It travelled a distance of 184 ft. and reached a speed of 60 mi. per hour. Operating under successive grants from the Smithsonian institution and the Guggenheim foundation, Goddard constantly improved his rockets, until in 1935 one of them attained an altitude of 7,500 ft. and a speed of more than 700 mi. an hour.

The theoretical calculations of Hermann Oberth sparked the formation, in 1927, of the German Society for Space Flight.

This society began to experiment with liquid fuel rockets. After a considerable number of test stand firings and a few flights of indifferent success, the German army became interested in liquid propellant rockets, and then began the vast program which was to lead to the production of the V-2 rocket.

In the United States, the American Interplanetary society (later to be known as the American Rocket society) began an experimental program in 1931. In 1933 the society fired its first free flight rocket. This rocket reached an altitude of 250 ft. before the oxygen tank exploded. A second rocket was flown in 1934. Because of the difficulties encountered in the operation of these rockets, it was decided that a more elaborate program of ground testing was necessary before further flights should be attempted. These tests attracted the interest of the United States navy. They led to the formation of a private concern, Reaction Motors, Inc., which carried out liquid propellant rocket development during World War II for the navy.

Two other organizations for serious experimentation with liquid propellant rockets were in existence prior to the entry of the United States into World War II. One was formed by several enthusiasts at the California Institute of Technology, Pasadena. This group formed the nucleus of the C.I.T. Jet Propulsion laboratory, which was initially sponsored by the U.S. army air corps and later jointly by the air corps and the ordnance department of the army. The other team was sponsored by the U.S. navy bureau of aeronautics. It was located at the U.S. Naval Engineering Experiment station at Annapolis, Md.

Solid Propellant Rockets

It should not be overlooked that great advances have been made in the field of solid propellant rockets. During World War II, hundreds of thousands of rockets of this type were manufactured. They were in general rather small, short burning time rockets used in free flight for area bombardment. Types were developed for use against tanks, and for firing from aeroplanes, where their lack of recoil proved an important asset. The development of solid propellant rockets and their application to many military purposes is a story in itself which can only be mentioned here.

World War II Developments

With the four groups—Reaction Motors, Inc., Pompton Plains, N.J.; the Jet Propulsion laboratory of the California Institute of Technology; Goddard's group; and an all-navy project working at Annapolis—the United States began its war-time efforts to develop liquid propellant rockets for military

uses. To permit greater flexibility of operation, a private company, the Aerojet Engineering corporation, was formed by some of the Jet Propulsion laboratory pioneers in 1942. The Jet Propulsion laboratory, however, continued as an effective force in the development of rocket devices, and in fundamental research.

The initial program in the United States was devoted almost exclusively to the development of rockets to assist the take-off of heavily loaded aeroplanes. This work formed a major portion of the liquid propellant rocket effort throughout the war.

Numerous Jato (jet-assisted take-off) projects were completed with technical success. The first was the application of rocket assist to the Douglas A-20 aeroplane. This work was done by the Jet Propulsion laboratory. An improved version was ordered in small quantity by the air corps from the Aerojet Engineering corporation. This version was also successfully flight tested.

The first liquid rocket to be successfully applied to a sea-plane in the United States was developed by the navy project at Annapolis. This was a jettisonable rocket, designed to be dropped by parachute, recovered and reused. Aerojet later designed and built about 75 refined units for the same application.

Reaction Motors, Inc., developed a large (for the time) rocket employing liquid oxygen, water and gasoline as propellants. This rocket power plant was installed in a navy sea-plane as a permanent piece of equipment, and was successfully tested.

It was early recognized that one of the primary advantages of the liquid propellant rocket, light weight, could only be realized with equipment which used pumps. Most early efforts used gas pressure for forcing the propellants into the combustion chamber. This procedure required very strong tanks and a large gas storage bottle, both heavy items for high performance rockets. One of the first attempts to use pumps was made by Aerojet in a Jato unit designed for a large navy flying boat. This power plant used a small gasoline engine to drive the pumps. Control difficulties prevented successful completion of this project, but many problems relating to pump development were solved in the course of the work.

While the major effort in the United States during the first few years of the war was in the field of assisted take-off, one project contemplated rocket propulsion for an interceptor aeroplane. A small test aeroplane was flown using a pressurized rocket power plant, but it was recognized that for the longer flight times expected of the operational aeroplane, a pumping system would be required.

An ingenious scheme was proposed for driving the pumps. The name for this interceptor engine was the "Rotojet." In it, the driving rocket combustion chambers, four in number, were mounted on a rotatable shaft, and set at a slight skew angle with the axis of the shaft. The entire motor assembly then revolved under the rotational component of the thrust produced by the skewing of the motors. The propellant pumps were geared to the rotating shaft.

Ingenious though the Rotojet was, the idea was beset by practical difficulties. The problem of transferring the propellants from the pumps to the rotating motor assembly was never successfully solved. Under the centrifugal force set up by rotation of the motors, it was difficult to get the injected propellants to mix properly, and efficiency suffered badly. The rotation also introduced starting and control problems. On the day of its final demonstration to the air corps, the engine exploded on the test stand and the entire project was cancelled.

The first really successful attempt in the United States to use a turbine to drive the propellant pumps was made by the Aerojet Engineering corporation under an air corps contract.

WING-MOUNTED Aerojet Assisted Take-Off (Jato) unit shown installed on an A-20 attack bomber

Dawn of the Space Age

While supervising navy contracts at Aerojet, R. C. Truax began experiments with a small gas generator, designed to produce relatively cool gases from rocket propellants, gases sufficiently cool to be put through a turbine without damaging the blading. This work was followed up by Aerojet and an engine was built and successfully ground tested at a thrust of 6,000 lb.

R. H. Goddard was an early exponent of turbine-driven propellant pumps. After considerable experimenting with oxygen and nitrogen evaporators, with bellows-type pumps, and with a pulsometer type of pump, Goddard decided that turbine-driven centrifugal pumps offered the greatest promise for reducing the weight of rockets. His first experiments with centrifugal pumps began in 1934. By 1940 he had flown a rocket that was a complete prototype of the modern turbo-rocket missile, complete with pumps, turbines, gas generator for driving the turbine, gyroscopic controls, etc. Another flight with a similar rocket was made in May 1941.

In almost every phase of rocket development, there seemed to be no path that had not previously been trod by Goddard in his far-ranging experiments. The great difficulty in assigning his specific items of equipment a proper place in the history of rocket development may be ascribed to the fact that he did not wait to perfect one component before proceeding to add a new one. As a result his experiments met with one heartbreaking failure after another. The two or three monumental successes that marked his work are testimony to his determination and optimism. His vision in recognizing, in great detail, what had to be done earned him his title as the father of modern rocketry, but no major component developed for any of his rockets ever attained a state of reliability where it would be considered satisfactory for other than experimental use. Indeed, from the vantage point of later years, it is obvious that Goddard was attempting, almost singlehandedly, to solve all of the problems that were later to absorb the efforts of thousands of men and millions upon millions of dollars.

Vergeltungswaffe Zwei — the V-2 Rocket

The preoccupation of the U.S. rocket industry and the armed forces with Jato and other short-range applications for liquid propellant rockets came to an end in Sept. 1944, when the first V-2 rocket crashed down on London from its launching site nearly 200 mi. away. The vast disparity between the rocket program of the United States and that of Germany was revealed with a shock. In the V-2, the Germans had an operational guided missile capable of speeds of more than 3,500 mi. an hour, able to carry a ton of pay load for a distance of almost 200 mi. This was at a time when experts in the United States were just beginning to wonder whether this new form of power might be usable in some kind of controlled missile.

The development of the V-2 goes back to 1932, and ranks with the Manhattan Project, which produced the atomic bomb in the United States, as one of the greatest engineering accomplishments of all time.

The story began when the activities of the German Society for Space Flight attracted the interest of the German Army Weapons group. The society had begun amateur experiments with liquid propellant rockets in 1929, much in the same manner as did the American Rocket society somewhat later. Rockets were built without adequate ground testing of components and as a result flights were uniformly unsuccessful. In 1932 several of the experimenters were taken under the wing of the German army. Nourished by a gradually increasing flow of government funds, the program grew steadily. By 1934, the first liquid propellant rockets built under the army program were fired. They were designated A-2. Two flew successfully. One reached an altitude of 7,400 ft.

GERMAN V-2 ROCKET, first to be fired in the U.S. after World War II, being erected on its firing table at White Sands, N.M., proving ground

By 1936, an all-out effort was authorized, and a vast and costly development station was constructed at Peenemünde on the Baltic. Complete facilities were constructed for every phase of rocket development—motors, pumps, controls, aerodynamic studies, etc. Even before the facilities had been completed, rockets were being fired.

By the end of 1939, design of the A-4, which later became known as the V-2, was well under way, and smaller test rockets, designated A-5, were being fired more than five miles high from the Greifswalder Oie near Peenemünde.

The first V-2, fired in the spring of 1942, failed after rising a few thousand feet, as did the second, but in early Oct. 1942, a third rocket was launched. This flight was a complete success. It may be regarded as an experimental milestone on the road to space. Whereas prior rockets had ascended only a few miles, the V-2 rose more than 50 mi. above the earth, travelled nearly 200 mi. over its surface, and attained a speed more than twice that of a rifle bullet. Less than six minutes were required for the missile to reach a target at maximum range. In comparison with all previous rockets, the V-2 was a huge affair, standing more than five stories tall on its launching platform. Its weight on take-off was nearly 14 tons.

The propellants used were liquid oxygen and a water-alcohol mixture. These propellants were contained in two lightweight, low-pressure tanks, and were delivered to the combustion chamber by two pumps. These pumps were mounted on a common shaft with a two-stage turbine. The turbine was driven by the products of decomposition of highly concentrated hydrogen peroxide. After reaching the pump from the fuel tank, the alcohol, under a pressure of more than 320 lb. per square inch, was

forced into a cooling jacket surrounding the combustion chamber and nozzle. From the cooling jacket, the alcohol passed through the main fuel valve, and then into the combustion chamber through a multiplicity of spray orifices.

The liquid oxygen was forced by the oxygen pump to the combustion chamber through the main oxygen valve and a set of brass shower-head type injection orifices.

Ignition of the alcohol and oxygen was by means of a pyrotechnic squib inserted through the exhaust nozzle. At full power, the rocket engine delivered a thrust of more than 55,000 lb. The firing duration was approximately 60 sec.

The entire propulsion system was enclosed in a thin steel shell which gave the rocket a streamlined shape. This shell was capped by an instrument and guidance compartment. In the extreme nose was a warhead of high explosive weighing somewhat more than a ton. To provide aerodynamic stability, four large fins were provided at the after end of the rocket.

The V-2 solved the problem of directional control that plagued all previous rockets by use of a complete gyro-controlled automatic pilot. Two free gyroscopes sensed motion of the rocket in roll, pitch and yaw. The measurements were transmitted to a computer which compared the measured values with the values desired. The difference, or error signal, was transmitted to powerful servomotors which operated controls to bring the rocket back to the desired attitude.

Two types of control surfaces were provided. Aerodynamic surfaces, somewhat similar to the rudder and elevators of an aeroplane, were located on the four fins. These surfaces helped steer the rocket whenever there was sufficient dynamic air pressure to give a useful reaction. The rocket, however, was fired from a small table, and accelerated rather slowly from a standing start. During this early part of the flight, the air rudders could have but little effect, while side winds would tend to weathercock the rocket into the wind. In order to provide means for correcting the rocket's flight during this interval, graphite vanes were installed in the jet blast. These vanes, operating in response to signals from the computer, deflected the exhaust gases to provide a steering moment.

The tremendous step over prior technology represented by the V-2 cannot be overemphasized. In the short span of roughly five years, the liquid propellant rocket had grown from an erratic, uncontrollable experimental gadget to a huge, complex vehicle for assaulting the boundaries of space. The performance potential inherent in that first V-2 rocket fired in 1942 has yet to be exceeded in all respects. It appears that no really fundamental changes or innovations are required to proceed from the V-2 to the true spaceship.

Other German Developments

Although the development of the V-2 completely overshadowed all other rocket developments of the period, it should not be allowed to eclipse the latter entirely. Other facets of the German rocket program contributed many important techniques on which future designers of other rockets could draw. Table III summarizes the more important German programs in the rocket field.

While the A-4 was based on the use of liquid oxygen as an oxidizer, it was the only major German project to do so. Either hydrogen peroxide of very high strength or concentrated nitric acid was used as an oxidant in all the other programs.

The use of hydrogen peroxide was championed most vigorously by the Helmuth Walter works at Kiel. This firm developed many propulsive devices using peroxide, including rockets for aeroplanes and missiles, and engines for submarines. Pure hydrogen peroxide, H_2O_2 , not only yields nearly 50% oxygen available for combustion, but, when exposed to a suitable cat-

WAC CORPORAL, rocket developed by U.S. army ordnance

alyst, it also decomposes vigorously with copious evolution of heat. On decomposing, free oxygen and water are formed. The heat released by concentrated solutions (in excess of 64.7%) is sufficient to raise the decomposition products to temperatures in excess of the boiling point of the water formed. Not only does this heat serve to compensate in part for the lower oxidizing potential when compared with liquid oxygen, but it makes hydrogen peroxide a useful rocket propellant even when used without a fuel. Although the jet velocity attainable with pure hydrogen peroxide alone is only about 4,700 ft. per second, the comparatively low temperatures involved and the ease with which decomposition can be controlled have led to the use of peroxide for many purposes where high performance is not so important as these other factors.

When used with a fuel, hydrogen peroxide gives performance only about 10% lower than does liquid oxygen with the same fuel.

As may be seen from the table, the German scientists applied the hydrogen peroxide rocket to two piloted aeroplanes, the Me 163 and the Natter. The engine used for both of these aircraft was the "hot" type, using a mixture of hydrazine hydrate and alcohol as fuel. Turbine-driven pumps were used to provide propellant pressure. Thrust could be varied at will from about 650 lb. to 3,800 lb. These aeroplanes exhibited phenomenal speed and rate of climb.

Nitric acid as an oxidant was exploited by the Bavarian Motor works (B.M.W.), by the Automobile institute (D.V.K.) and also by the Peenemünde organization. A wide variety of missile and aircraft power plants were developed, which added to the general fund of technological information. One of the largest rocket power plants to use nitric acid was Peenemünde's Wasserfall. This missile was a large anti-aircraft device weighing nearly 8,000 lb. It was capable of engaging bomber aeroplanes at altitudes up to 60,000 ft. and ranges up to 15 mi.

Nitric acid possesses two advantages over liquid oxygen as an oxidizer: first, it is a liquid at ordinary temperatures; sec-

Dawn of the Space Age

Table III.—German Wartime Rocket Developments Using Liquid Propellant Power Plants

Type	Description
Piloted aeroplanes	
Me 163	Interceptor aeroplane, 560 m.p.h. speed. Hydrogen peroxide-hydrazine hydrate propellants. Turbo-pump engine. Used operationally.
Natter	Vertical take-off interceptor, 620 m.p.h. speed. Same engine as Me 163. Experimental only.
Me 262	Experimental version used BMW rocket engine in addition to turbojet. Nitric acid-amine propellants. Engine-driven pump system.
Surface-to-surface missiles	
V-2	Ballistic missile, 3,500 m.p.h. speed, 190-mi. range, one-ton warhead. Liquid oxygen-alcohol propellants. Turbo-pump engine. Used operationally.
A-4b	V-2 fitted with wings for gliding. Experimental only.
A-9	Missile similar to A-4b. Design stage only.
A-9/A-10	Two-stage glide rocket, 3,000-mi. range. Design stage only.
Surface-to-air missiles	
Wasserfall	Single-stage rocket with small cruciform wings. Maximum speed 2,400 ft. per second, 15-mi. range, 8,000 lb. weight, 670-lb. warhead. Late development stage. High production planned. Nitric acid-amine propellants, compressed gas propellant feed system.
Enzian	Two-stage winged rocket, 4,300 lb. weight, 1,000-lb. warhead, high subsonic speed. Late development stage. Nitric acid-amine propellants, pressure system.
Rheintochter III	Two-stage winged rocket, 3,400 lb. weight, 351-lb. warhead, high subsonic speed. Early development stage. Nitric acid-amine propellants. Pressure system.
Air-to-air missiles	
X-4	Single-stage rocket with cruciform wings. 132 lb. weight, 44-lb. warhead. Speed, 560 m.p.h. Range, 3,100 yd. Nitric acid xylene propellants. Pressure system. Late development stage.
Air-to-surface missiles	
HS 293	Glide bomb with rocket booster. Hydrogen peroxide propellant. Operational use.

ond, it ignites on contact with a number of high performance fuels. This last feature eliminates the necessity for a separate ignition system, a simplification particularly important for applications where successive restarting is desired. The performance of nitric acid with a given fuel is comparable to that given by hydrogen peroxide with the same fuel.

Postwar Developments in the United States

By the end of the war, German rocket development was several years ahead of the U.S. effort. As knowledge of German

activities began to reach the United States, the U.S. program was expanded and accelerated. Many new programs for applying liquid propellant rocket propulsion were initiated. Many of these were begun in the closing days of the war, when money for such work was plentiful, and the romance of the rocket had extended even to the upper echelons of the military establishment. The newness of the field and the shortage of experienced people caused considerable confusion and misdirection. The difficulties involved in developing guided missiles were frequently underestimated. Ambitious programs were initiated, only to be cancelled in a year or two because of administrative impatience at the inevitable slow progress.

Out of the welter of projects, however, some survived sufficiently long to make significant contributions to the rocket art, and hence possibly to the ultimate conquest of space.

The first attempt by the U.S. government to build a rocket for high altitude exploration resulted in the WAC Corporal. The WAC Corporal was a small, gas-pressurized nitric acid-aniline rocket weighing about 750 lb. fully loaded. In some degree it served as a small-scale prototype for the larger Corporal surface-to-surface guided missile which followed. The WAC Corporal used a solid propellant booster rocket to impart an initial high acceleration. This extra kick gave the WAC Corporal sufficient velocity by the time it reached the top of its launching tower that the effect of side-winds was minimized. The rocket would then continue to rise substantially straight up without the aid of gyroscopic steering mechanisms.

The WAC Corporal was developed by the Jet Propulsion laboratory of the California Institute of Technology. Altitudes in excess of 40 mi. were attained by it. The only two-stage liquid propellant rocket ever flown was a combination of a WAC Corporal and a V-2. This missile holds the all-time altitude record of about 250 mi.

A larger, refined version of the WAC Corporal was designed by the Aerojet-General corporation of Azusa, Calif. It has been used extensively for upper atmosphere research. This rocket, known as the Aerobee, is capable of rising more than 80 mi. high, with a pay load of 150 lb. of instruments.

The Corporal missile itself is very similar in general arrangement to the WAC Corporal or Aerobee. It is a nitric acid-aniline, pressure-fed liquid propellant rocket, but is considerably larger than the Aerobee, grossing more than 10,000 lb. at take-off.

AEROBEE ROCKET, a larger version of the WAC Corporal, shown mounted on trailer

Several other guided missiles of the postwar era used liquid propellant rocket propulsion. One of these, the Nike anti-aircraft missile developed by the army, attained operational status in the early 1950s.

Of all the U.S. postwar projects, the Viking is the most representative of best modern practice in the design of high performance rockets. Since it gives the best gauge of the current stage of progress towards the goal of space flight, a rather full discussion of this rocket is warranted.

After the end of the war with Germany, a number of V-2 rockets were brought to the United States, and were fired from the army proving ground at White Sands, N.Mex. The primary objective of the firings was upper atmosphere research. It soon became apparent that, because of the small total number of rockets obtained and the progressive deterioration of certain of their vital components, the research program could not be completed with the rockets available. The Naval Research laboratory, therefore, contracted with the Glenn L. Martin company for fabrication of a number of new rockets designed expressly as research vehicles. These rockets were named Vikings.

In many respects, the Viking is very similar to the V-2. Essentially the same propellant combination is used, liquid oxygen and alcohol. Pumps are used to feed these propellants to the combustion chamber. The pumps, as with the V-2, are driven by a turbine which is in turn operated by the decomposition products of 90% hydrogen peroxide. One difference is that the peroxide is decomposed by a solid catalyst, as was done with the Me 163 power plant, rather than by means of the permanganate solution used in the V-2 engine.

Considerable weight savings were effected through the use of integral propellant tanks and refined power plant compounds. Table IV gives a comparison of the Viking and V-2.

Table IV.—Characteristics of the German V-2 and the U.S. Viking Rockets

	V-2	Viking
Gross weight (lb.)	28,000 (100%)	14,915 (100%)
Empty weight (lb.)	8,800 (31.4%)	3,007 (20.5%)
Pay load (lb.)	2,200 (7.8%)	958 (6.4%)
Propellant	Liquid oxygen 75% alcohol- water mixture	Liquid oxygen 100% ethyl alcohol
Length (ft.)	46	45.7
Maximum body diameter (ft.)	5.4	4½
Engine thrust (lb.) (sea level)	56,500	20,000
Duration of burning (sec.)	60-63	120
Burnout velocity (ft. per sec.)	4,900	6,300

Two rather different versions of the Viking were produced: a long slender design, used on Vikings 1-8, and a fatter, heavier version for subsequent rockets.

One interesting and unique feature of the Viking is the use of a gymballed motor for steering. The V-2 had employed carbon vanes, riding in the exhaust blast, to achieve control at low speeds. These vanes were heavy, constituted a constant source of trouble, gradually eroded during flight, created drag, and did not provide as large a control moment as might be desired. The expedient of swivelling the main thrust motor overcame nearly all of these difficulties. More important, the control forces made available by this system were so great that elimination of all aerodynamic surfaces, including fixed fins, seemed a possibility. Removal of fins from rocket design would undoubtedly result in a very considerable saving in weight. This, however, remained a possibility for the future.

The essential components of the modern liquid propellant rocket may also be noted by reference to the Viking. In the conical or ogival nose is a space reserved for the pay load. In a research rocket such as the Viking, this pay load would consist

TWO-STAGE ROCKET, a WAC Corporal mounted in the nose of a V-2, starting its record flight to a height of 250 mi. on Feb. 24, 1949

of scientific instruments. In a guided missile, the pay load would usually be a high explosive or an atomic or thermonuclear bomb.

In the next compartment are contained the "brains" of the vehicle: the gyroscopic attitude sensing devices, the computers and other devices to determine the position and perhaps the velocity of the rocket. Radio equipment to send information back to earth would probably also be placed in this section. In the Viking this compartment also holds a valve for admitting ram air into the alcohol tank to provide a small positive pressure inside.

Next are the two propellant tanks, the forward one for alcohol, the after one for liquid oxygen. These tanks are very light. They are fabricated of thin sheet aluminum alloy.

The section below the propellant tanks contains the propulsion machinery and the "muscles" for steering the rocket: the hydraulic power supply and the servomotors for changing the direction of the thrust axis.

On the fins are mounted roll jets and roll tabs to prevent the rocket from rotating about its longitudinal axis. The former are small hydrogen peroxide rocket motors which provide corrective torque throughout the flight. The roll tabs are small aerodynamic surfaces which supplement the action of the roll jets during high velocity flight through the atmosphere. The fins also carry the beacon antenna, which is used to assist ground radar in tracking the rocket throughout its flight, and the telemetering antenna, through which scientific data are radioed to the ground.

The turbo-pump installation, for pumping the propellants from the low-pressure supply tanks into the high-pressure combustion chamber, is located in the after compartment.

There were many other developments of the immediate post-war period which contributed to the engineering background needed to design space craft. Many propellant combinations were investigated and materials for use with the specialized fluids of rocket propulsion were developed. Testing techniques were improved. New cycles and new engine components were developed, many still cloaked by military security.

One field of application for rocket power has been to man-carrying aeroplanes. Two wartime German efforts in this class have already been mentioned, the Me 163 and the Natter interceptors. In the United States, a power plant was developed for the navy by Reaction Motors, Inc., of Rockaway, N.J. Two versions of this engine were developed. One, a gas-pressurized model, was used in the Bell X-1 built for the air force. This aeroplane was the first piloted craft to exceed the speed of sound in level flight, a feat first performed in Oct. 1947. The second engine used a turbo-pump. This engine was installed in the Navy-Douglas Skyrocket. On Aug. 7, 1951, the Skyrocket established a speed record of 1,243 mi. per hour and reached an altitude of nearly 80,000 ft. The turbo-pump engine was then installed in a revised X-1A. On Dec. 12, 1953, a new record of 1,600 mi. per hour was set by the X-1A, and also a new altitude record considerably in excess of 80,000 ft.

A new rocket propelled research aeroplane, the Bell X-2, has been announced but no information on its performance has been released. It is known to be powered by an engine developed by Curtiss-Wright corporation. It was reported that development of a further improved rocket plane was being started. It was said that this aeroplane would be capable of rising to an altitude of more than 100 mi.

Rocket Developments in Other Countries

Rocket development in most countries of the world is carried out under even stricter secrecy than in the United States. Some

Dawn of the Space Age

STATIC TESTING STAND of North American Aviation's Aerophysics field laboratory in the Santa Susana mountains north of Los Angeles, Calif. A rocket engine is shown being tested

information has been disclosed, which indicates that several other nations have energetic programs under way.

The Swiss were among the first to reveal the development of an anti-aircraft guided missile. This missile was produced by the Oerlikon firm, noted for many years as a manufacturer of guns and other armament. Their anti-aircraft missile is a comparatively small device, about 16 ft. long. It has cruciform wings, and is powered by a nitric acid rocket. The power plant is of the pressure-fed type. The United States government has purchased a number of the Oerlikon missiles for test purposes.

France also is active in the liquid propellant rocket field. The French have developed a sounding rocket somewhat similar to the U.S. Aerobee. It is known as Veronique. This rocket weighs about 2,000 lb. and has ascended as high as 40 mi. The firm of SNCASO produced in 1955 a fighter aeroplane, the S.O. 9,000, which uses a pair of small turbojets and a rocket. The turbojets are mounted on the wing tips, and are used for cruising and landing. The rocket, installed at the rear of the fuselage, provides thrust for high performance. Both of these developments are believed to use nitric acid type rocket engines.

The rocket program of the United Kingdom is probably the third most intensive in the world, following those of the United States and presumably the U.S.S.R. Two hydrogen peroxide

rockets for assisted take-off have been announced by the De-Havilland company. The first is the Sprite. This engine uses catalytically decomposed hydrogen peroxide as a propellant. The propellant is fed by gas pressure.

A new version of the Sprite, known as the Super-Sprite, is a "hot" combustion device, burning kerosene with the hydrogen peroxide oxidizer. This Jato gives 4,000 lb. of thrust for 40 sec.

A liquid oxygen-kerosene rocket engine has been developed by the Armstrong Siddeley firm. This engine, known as the Snarler, is apparently designed for use as an auxiliary power plant on turbojet powered aircraft, for it requires an external source of power to drive its propellant pumps.

Authoritative information on the rocket development program of the U.S.S.R. is lacking. It has been reported that an enlarged version of the V-2 is in quantity production. Considerable evidence also exists that Russia has under development a very large liquid propellant rocket power plant having a thrust of more than 250,000 lb. Such a power plant would be suitable for use in a two-step rocket. With structural design no better than the V-2, the combination of a V-2 and a larger booster stage using the aforementioned engine could achieve ranges in excess of 1,000 mi.

Near the end of World War II, the Russians captured the pilot plant where the German Wasserfall missile was being produced. They are believed to have perfected this missile for anti-aircraft use.

Many reports have appeared of experiments with rockets for auxiliary propulsion of turbojet powered aeroplanes. An improved version of the German Me 163, known as the YAK-21, is said to have been developed, and is reported to be capable of speeds in excess of 900 m.p.h.

A missile-launching site is reported to be in existence at Severnaya Zemlya. Developmental work has been done at Khimki, near Moscow.

The Rocket Industry Grows

From the four little groups of prewar days, rocket technology has spread in the United States until it forms the primary activity for several sizable industrial concerns and is an important phase of the activities of many other organizations.

The Jet Propulsion Laboratory of the California Institute of Technology has grown from a handful of enthusiastic students to a vast professional organization. From one small test stand, on the California Institute of Technology campus, the physical facilities have increased to include dozens of well-instrumented test pits, shops, laboratories and offices totalling thousands of square feet. The entire establishment is now at a separate location, and operates with a considerable degree of independence.

Since its first incorporation in 1942, the Aerojet Engineering corporation (now the Aerojet General corporation) has played an important part in the development of both liquid and solid propellant rockets. The original facilities consisted of one rented former automobile agency in Pasadena, and a sheet iron test stand near Azusa, Calif. Aerojet now operates extensive facilities of its own at Azusa, and a large solid propellant rocket manufacturing plant at Sacramento.

Reaction Motors, Inc. was organized shortly after the United States entered the war in December 1941. With a total capital of \$5,000 and a staff of seven, they began work on a navy contract in the basement at the home of one of the charter members. Their first test site was an abandoned gravel pit, and their first shop a converted garage in Pompton Plains, N.J. Shortly after the war, the company moved into a government-

NIKE GUIDED MISSILES in firing position at a Continental Air Defense command site near Washington, D.C., in 1955

Dawn of the Space Age

Dawn of the Space Age

owned former barracks at Lake Denmark, N.J., and used a test facility supplied nearby by the navy. In 1949, the headquarters of Reaction Motors was moved to Rockaway, N.J., where it now operates.

Aerojet and Reaction Motors still (1955) are the only two private concerns of appreciable size in the United States having rocket development as their primary activity. Many older companies, however, such as North American Aviation, Inc., have taken up rocket engineering as a substantial endeavour.

Other concerns build liquid rocket propelled missiles or aircraft but buy their power plants elsewhere. Among these are the Glenn L. Martin company, the Chrysler corporation, Republic Aviation corporation, Fairchild Engine and Airplane corporation, Consolidated-Vultee Aircraft corporation, Douglas Aircraft company and the Firestone Tire and Rubber company.

The rocket project at Annapolis was the first U.S. government activity to experiment with liquid propellant rockets. Since it was first set up in 1941, many other government owned and operated facilities for testing rocket engines and launching rocket missiles have been created.

In addition to the facilities of industry and the three military services, smaller facilities are operated for research purposes by the National Advisory Committee for Aeronautics and by several universities. The NACA does its work at the engine laboratory in Cleveland, O. Purdue university, Princeton, Ohio State and the University of Michigan, as well as the California Institute of Technology (the Jet Propulsion laboratory) all have facilities for testing rockets available to students. In general, the universities also do research under government contracts.

Summary

How then does man stand, in this year 1955 A.D., on the road to the conquest of space? First, he discovered that the lights

he saw in the sky are material bodies, that, in general, they are very large—larger, on the average, than his own world. He was somewhat dismayed to discover that even the nearest was incredibly far away, and that nearly all of the distance was through a void, a vacuum more complete than that obtainable with the best vacuum pump in his laboratory. He discovered that he stood at the bottom of a deep pit created by the force of gravity. To climb out of this pit and travel the vast distances to the moon and planets seemed utterly impossible.

A few visionaries of scientific bent began, however, to calculate precisely the magnitude of the problem. The calculations soon showed that the rocket, and in particular the type using liquid propellants, seemed, at least in theory, capable of operating in airless space, of actually achieving the tremendous speeds required to hurtle out of the gravitational well, and to traverse the great distances in a reasonable time.

First under the impulse of amateur enthusiasm, then under scientific sponsorship, and finally under the powerful urge of military necessity, the ideas of the dreamers began to be changed into accomplished facts. The calculations were confirmed by test flights. A great organization of scientists and engineers grew and elaborate facilities were erected for the fabrication and testing of large rockets.

ROCKETS AND SPACE FLIGHT

There is now a well developed theory for space flight. The organization and basic technology is in existence.

It is true that in order to reach escape velocity with a three-stage rocket, a considerable improvement over present-day rocket performance is required. Each step would have to provide a speed of about 12,500 ft. per second in order to allow a slight margin of reserve. The best U.S. rocket to date, the Viking, can attain only half that speed. The over-all mass ratio

VERTICAL LAUNCHING of a Viking from aboard ship

TERRIER, a U.S. Navy anti-aircraft guided missile, one of a large family of missiles driven by solid propellant motors. Shown ready for launching from a battleship, it is silhouetted against the booster blast from another Terrier just fired

is adequate, but about 4% of the gross weight of the Viking must, by design improvements, be converted to pay load. In addition to this increase in structural efficiency, an increase in exhaust velocity must be obtained. It has been shown that better propellants offer this possibility. As mentioned in the example, the substitution of hydrazine for alcohol would bring an improvement of the proper order. Gasoline would do almost as well. The fact that the second and third stages would operate almost entirely at zero back pressure would permit a gain of 10% to 15% in exhaust velocity. A final improvement would be the addition of a device to insure the simultaneous exhaustion of both propellants.

These factors and other possible minor improvements indicate that a point has been reached where escape velocity could be achieved with a rocket of only three stages. Such a rocket could be constructed on the basis of existing techniques, without any new discoveries or major new developments.

The Orbital Technique

While the three-stage rocket to achieve escape velocities appears to be within the realm of engineering possibility, there remain certain questions of fabrication feasibility that depend on the absolute size of the rocket.

Suppose, for example, it is desired to send a pay load of 1,000 lb. to the moon. In order to free this pay load from the earth's gravity, using the 10% pay load ratio assumed previously, we see that the total weight of the first step will be ten times 1,000 lb. The first and second steps together will weigh ten times that value, and the starting weight of the three-step rocket will be $1,000 \times 10 \times 10 \times 10$ or 1,000,000 lb. This is a rather large rocket. If its proportions were made similar to those of the German V-2, the rocket would be about three times as long as the latter, or about 140 ft., which would be about 20 ft. shorter than the B-36 bomber. The weight of the

structure of the rocket itself, less fuel, would be 200,000 lb. This is approximately the same as the empty weight of the B-36. Since hundreds of B-36 bombers have been built, it may be seen that actual construction of such a rocket would not present an overwhelming task. It seems rather probable that the cost would approximate that of a modern aircraft on a per-pound basis. Thus a cost in the neighbourhood of \$5,000,000 to \$10,000,000 is indicated.

For the purpose of simply sending a pay load of 1,000 lb. (perhaps a small atomic bomb) to crash against the moon, it might be most practical to build a large rocket and launch it from the surface of the earth. Such a "moon messenger" would not only signify its arrival by a flash of light visible from the earth, but would tell earthly observers much concerning the composition of the moon's surface. If we wish to circumnavigate the moon and return to earth, however, larger pay loads will be required. An additional factor of ten seems a minimum, for reasons that will be seen later.

This factor changes the picture completely. The initial weight of the rocket would increase in substantially the same proportion as the pay load. A structure weighing ten times as much as the B-36 would be completely beyond the limits of the current state of the airframe construction art. Moreover, the rocket would be too large to be moved, except possibly by water. Even more important would be the all-or-nothing nature of the flight. Past experience has shown that many rockets of a given design must be fired before reliable performance can reasonably be expected. For a rocket of the size and complexity of a moon rocket, perhaps 50 would have to be fired before a manned flight could be attempted. Construction of 50 rockets each ten times as big as a B-36 would be a gargantuan task. Development and ground testing of the vehicle would also prove a formidable and expensive job. Fortunately, there is a stratagem which would avoid the necessity for building such very large rockets and bring the problem back into the realm of practical realization.

It has been shown that if a velocity in the neighbourhood of

Dawn of the Space Age

Fig. 7.—Two- and three-stage space rocket

25,000 ft. per second is imparted to an object, it will describe an elliptical path around the earth with the centre of the earth occupying one focus of the ellipse. If the ellipse nowhere intersects the atmosphere, the body will continue to orbit around the earth substantially forever. By properly regulating the trajectory of a rocket during the burning period, the orbit can be made circular.

It has been noted that the velocity required for a body to orbit around the earth at an altitude high enough to be above the sensible atmosphere is about two-thirds that required to escape completely from the pull of the earth's gravity. For the type of rocket used as an example, only two stages would be needed to reach orbital speed. This reduces the initial weight by a factor of ten, and brings the 10,000 lb. payload rocket back down to the size of a B-36. (Fig. 7.)

At first thought, construction of an *orbital* rocket might be considered pointless if the objective was a flight to or around the moon, but this is not so, for the orbital rocket gives us a method of reaching the moon with a comparatively small craft. Suppose a type of rocket is developed which is capable of placing 10,000 lb. of payload in an orbit high above the earth. If, now, we build nine of these rockets and send the first eight into the same orbit at the same point, and if the payload of the eight rockets is composed entirely of propellants, or fuel, we will have established a "gas station" in space with a store of 80,000 lb. of this fuel. This is just the amount required to refill the upper stage of our two-stage rocket. Now let us send up a ninth rocket. The payload of this rocket would be the vehicle which would circumnavigate the moon and return to earth. This ninth rocket could make contact with the cache of propellants, refuel and be on its way on a journey around the moon. The procedure saves no propellants, it requires the same total weight of rocket structure (unless some of the stages can be retrieved and reused), but it has reduced the development and construction difficulties by a large factor.

At this point, the problem of the return voyage should be considered in more detail. If men are to be carried out into

space, provisions must be made for them to return to earth. This is by no means a simple matter. In considering the problem of leaving the earth, it has been shown that it is necessary to acquire a very high velocity. In order to return and land safely, it is necessary to again reduce the speed of our spacecraft to zero. Two ways of accomplishing this appear possible. One is to reverse the rocket and blast its jets in the direction of motion. This is the procedure which must be used to effect a landing on an airless planet.

If this method were used to land on the earth, the same mass ratio would be required for the landing as for the take-off. In each case, the *change* of velocity is the same; *i.e.*, 37,000 ft. per second. Consequently, by Newton's law, the required impulse (the product of thrust and time) will be the same, and the mass ratio required to impart this impulse will likewise be the same, following the same reasoning used to determine the means for imparting the initial velocity. For an orbital rocket, similar to the oxygen-hydrazine rocket previously described, two additional stages would be required. Each would be larger by a factor of ten than the sum of the weights of all the smaller stages. In other words, the round-trip orbital rocket would be 100 times as heavy at take-off as a one-way rocket. Since it is possible to transport only about 1% of the starting weight *into* an orbit, the round trip would be bought at a fantastic price.

It might be thought that the return trip to the earth could be made by parachute, that the tremendous energy contained in an object travelling 25,000 ft. per second might be dissipated in atmospheric turbulence. The difficulty is that when a solid object entered the atmosphere at these tremendous speeds, the air would be greatly compressed. The compression would raise the temperature to unheard-of values. A parachute would be incinerated long before it had slowed the rocket to a reasonable speed.

It should be noted that although traces of air may be found up to very high altitudes, nearly half of all the air is contained in a layer only three miles deep. Rather than visualizing the atmosphere as a deep, soft blanket covering the earth, it should be compared with the skin of an onion, for in relation to the 4,000-mi. radius of the earth, a thickness of 3, 30 or even 300 mi. is very small.

Although the temperature of the air, compressed by an object entering the atmosphere at orbital speeds, would become very high, it is the quantity of heat transferred to the object which affects the temperature of the latter. This quantity of heat depends not only on the temperature difference between the air and the object, but also on the air density. At the very low densities existing at extreme altitudes, the quantity of heat transferred can be quite small. Of course, if the heat transfer continues for a long time, any mass will eventually be heated to the temperature of the air, unless some heat is removed.

The one way by which heat can be removed under these conditions is by radiation. The rate at which heat is radiated depends upon the nature of the radiating surface, and upon its absolute temperature. Since the amount of heat transferred *to* the body *decreases* as the temperature of the latter is increased, and the amount of heat radiated *from* the body *increases* as its temperature increases, we might expect that a temperature would exist at which the two heat flows would just balance. This is indeed the case. The problem in designing a rocket for safe re-entry into the atmosphere is to keep this equilibrium temperature below the softening point of the skin of the rocket. This might be achieved by keeping the rocket at a sufficiently high altitude, where the air density is very low, until air resistance has somewhat reduced its speed. The rocket can then drop lower, lose more speed, drop further, and so on until the compression temperature of the air (called stagnation tempera-

U.S. ARMY ROCKET MISSILES Honest John (left), Nike (centre) and Corporal (right), each one the first of its type to be made combat ready and first to go into production. Honest John is a medium-to-long-range artillery rocket, Nike a long-range guided missile for destroying enemy planes and Corporal a long-range surface-to-surface guided missile. The weapons are shown on their launchers, the launcher for Honest John also serving as a transporting trailer

ture) is below the critical failure temperature of the structure.

Unfortunately, a wingless rocket could not maintain itself at a sufficiently high altitude to sustain this critical relation between frictional heat input and radiant heat output. Without more lifting surface than could be provided by the rocket body, the rocket would rapidly fall into denser and denser air, its temperature would rise and ultimately the structure would fail. Vaporization of the rocket and its occupants would be inevitable.

The addition of wings could prevent this catastrophe. The use of winged rockets is the method which appears, at the present, to be best for returning to earth from an orbital flight. With wings, the rocket could be kept high enough, where the density is sufficiently low that the heat input could be matched by the heat output, at a reasonable value of skin temperature. It has been calculated that the wing loading required to main-

tain the maximum skin temperature below $1,300^{\circ}\text{F}$. would be about the same as that required to give a landing speed of 65 mi. per hour at sea level.

A temperature of $1,300^{\circ}\text{F}$. would be a reasonable value for stainless steel skin.

It would, of course, be necessary to place insulation between the skin of the rocket and the inside cabin, to insure that only a small transfer of heat took place between the skin and the interior. Refrigeration in some form (perhaps by evaporating liquid oxygen) would then maintain the interior at a livable temperature.

Dawn of the Space Age

Fig. 8.—The flight around the moon

Dawn of the Space Age

A winged rocket could be used for the entire trip around the moon, returning directly to the earth after circumnavigating the moon. Aerodynamic braking would be employed to dissipate the velocity acquired in the long fall back to earth (substantially the same as the escape velocity of 7 mi. a second).

Another possibility would be to carry into an orbit, by means of ferry rockets, a special "deep space" vehicle. If too large for one ferry rocket, such a vehicle could be carried up in sections and assembled in space. This vehicle could probably be designed more efficiently for such a specialized mission. It would be tailored expressly for flight in space, with no provisions for landing on any body. Since there would be no air, no streamlining would be required. Since there would be no danger of falling back to earth, smaller motors could be used. Both these factors would contribute to reduced structural weight.

The space explorers would board this craft out in space, travel around the moon, and return to an orbit around the earth. A ferry rocket, using a winged upper stage, would then make contact with the deep space rocket and return the crew to earth.

In this type of operation, as in that described previously, the lunar rocket would have to be fuelled from an orbital propellant supply. This fuel would be used to accelerate the rocket from the orbital speed of 25,000 ft. per second to the escape velocity of 37,000 ft. per second. If properly steered, and if the velocity were very closely controlled, the rocket would fall into an orbit around the moon. This orbit could be made to pass very close to the moon's surface. Theoretically it could be held close enough so that the rocket would barely clear the highest mountain peak. Actually a somewhat higher altitude would be desired, but a height of only a few miles might be chosen.

There are some orbits which would return the circumlunar rocket to earth again without further application of power, but, practically speaking, a little braking action on approaching the moon and a little positive acceleration on leaving would probably be used to remove the requirement for very precise speed control.

The winged rocket, on the return flight to the earth, would be directed in an orbit that would only graze the atmosphere at closest approach. Whether it would be desirable, at these higher speeds, to attempt to hold the rocket, by negative aerodynamic lift, in the atmosphere, and spiral it toward the surface of the earth, is not yet clear. An alternate method would be to pass through the atmosphere, lose a little speed through friction, leave again in a natural celestial ellipse and return to repeat the process until circular velocity had been reached. The final return to earth would then be as described for the glide down from a satellite orbit.

The Voyage Around the Moon

Having seen the elements needed to make a journey around the moon and back to earth, and the theory underlying, we will follow through such a voyage step by step, using the winged rocket for the trip far out into space. (Fig. 8.) We will need eight rockets, each consisting of stages 1 and 2 (shown in Fig. 7), equipped with the pay load section shown on the right. These sections will be filled with propellants. These rockets will be launched from the earth, preferably from a location near the equator. In order to take advantage of the speed of rotation of the earth, they will take off toward the east. Each rocket ascends in the plane of the moon's rotation. After about 100 sec., the first stage burns out and the second stage is ignited. The velocity at this point is about 12,000 ft. per second. The first stage falls back to earth and the second stage continues to accelerate. After about another 100 sec., the sec-

ond-stage power plant is shut off, with a small amount of propellants remaining. The rocket then coasts upward on an elliptical trajectory until it begins to fall back toward earth. Then the power plant is ignited again for a few seconds to increase the speed to circular velocity for the particular altitude reached. (See Fig. 5.)

Although theoretically only eight rockets would be required, several "spares" would no doubt be provided.

We now have a number of rockets, whose nose sections are filled with propellants totalling in excess of 80,000 lb., floating around in space, more or less in the same orbit, and as close together as our control accuracy permits (but perhaps thousands of miles apart).

Next, the passenger rocket, composed of the same booster stages 1 and 2, but now carrying a winged rocket as pay load, is launched in the same fashion. This winged rocket contains two or three hardy "spacemen," survival equipment for about two weeks in space, scientific equipment and sufficient propellants to accelerate this stage to perhaps 3,000 ft. per second.

As the first stage is ignited, the passengers are forced down in their reclining seats with twice their apparent weight. The rocket ascends slowly at first, then, as the fuel load is consumed, with ever-increasing acceleration.

At first-stage burnout, the crew experiences an acceleration which makes them feel ten times as heavy as normal. Under these conditions, manual control of the craft is impossible. Automatic devices control the action of the rocket precisely, its human occupants having only emergency override control in case of equipment malfunction.

As the first-stage propulsion ceases, there may be a brief period of weightlessness. Then the second-stage motors come on and twice normal weight is again felt. At this point, the rocket is some 40 mi. high. The large first stage falls away, and the remaining two stages continue upward. (Fig. 9.) The occupants' weight again increases as before, then, suddenly all weight ceases as the first burning period of the second stage ends. The aeroplane-booster combination coasts upward, losing speed gradually as the force of the earth's gravity bends the flight path back toward earth.

Back on the ground, very accurate measurements are being made of the path of the rocket, of its speed and position at every instant. High-speed electronic computers determine the exact instant at which the second burning period of the second stage should commence. If the rocket has performed exactly as predicted, the final burning should take place just as the rocket reaches the peak of its trajectory (called, in astronomical parlance, the apogee of the ellipse). No doubt some deviation from the expected value has taken place. The time of initiation of the second burning period, and the additional burning time required, is radioed to the rocket at the proper instant. A final brief period of thrust, and the second stage has done its work.

If all has gone well, the second stage, carrying the winged rocket and crew, has arrived in the same orbit as the first eight rockets. Meanwhile all the fuel rockets, as well as the manned vehicle, are being tracked by ground radar. Computers at a central ground station now compare the positions of all the rockets and send to the manned rocket instructions as to how to reach the nearest fuel rocket. These instructions probably would take the form of a thrust, time and direction. The winged rocket, having detached the second-stage booster, uses its own internal propellants to reach the nearest (energy-wise) fuel rocket.

On reaching the fuel rocket the winged rocket replenishes its own propellant supply, using first any propellants remaining in the fuel rocket booster tanks, and then drawing on the pay load section as needed. The nose section, containing the remain-

ing propellants, is then detached and attached to the winged rocket by means of a tow line. The process is then repeated for the second fuel rocket. The winged rocket proceeds as before, towing the extra pay load compartment. This routine continues until a full load of propellants for both the winged rocket and a second-stage booster has been collected. (Fig. 10.)

The "astronauts," or space travellers, now transfer their hoard of propellants to the main tanks of the second stage of the last fuel rocket, remove the fuel pay load nose and replace it with their own craft. They may also detach some of the motors of the second-stage booster, since high thrusts are not needed to proceed toward the moon.

For these operations in space, the occupants must leave the confines of their ship. Donning pressurized "space suits" and secured to their craft by long nylon lines, the crew members float about, propelled by small hand rockets. The operations of unfastening cargo compartments from boosters, refuelling, etc., have been simplified and especially adapted to being performed by men whose movements are hampered by clumsy space suits.

When these operations have been completed, the moon rocket, consisting of the winged rocket and a second-stage booster, is fully fuelled and prepared for departure from the terrestrial orbit.

Acting again on instructions from the earth, and at the proper time, the crew now orients the craft in the required direction and fires the newly refuelled booster rocket. In a matter of perhaps two to ten minutes, the winged rocket reaches a speed of about 37,000 ft. per second, and, having detached the booster, is on a new elliptical path that will carry it toward the moon. It proceeds outward along this ellipse, losing speed gradually until it passes the so-called neutral point where the gravitational pull of the moon just balances that of the earth.

The spaceship now falls under the influence of the moon's gravity, and the speed gradually increases. During this fall toward the moon, careful measurements must be taken to determine the exact path of the spaceship. If it is not following the desired orbit, a corrective impulse is computed and is applied by the internal power plant of the winged third-stage rocket. In order to shorten the duration of the voyage, it is probable that a total velocity of slightly more than 37,000 ft. per second will have been imparted on leaving the refuelling orbit. Some braking now must be applied to insure that the rocket will be "captured" by the moon and pulled into an elliptical path around it. This is done by turning the spaceship end for end and operating the power plant for a short time. The braking and corrective thrust is applied in such a manner as to cause the rocket to orbit around the moon at a satisfactory altitude.

Now comes a busy period for the astronauts, as their craft begins to swing close to the moon. While most of their equipment is automatic, there remains the necessity for checking everything for proper functioning, perhaps for stopping and starting various devices, relaying information homeward by voice radio, making notes of their own observations and reactions, etc.

The trip around the opposite side of the moon would probably require somewhat less than an hour and a half. If this time proved too short to make all the observations and secure all the desired information which could be obtained, a second circuit of the moon might be made, provided some braking had been applied on the way down. If the velocity was less than about 7,000 ft. per second at the point of closest approach to the moon, the rocket would not reach the neutral point, as it returned toward the earth, but would continue in an approximately elliptical path around the moon. Photographs of the moon's surface would be taken. By using a relatively small telescope, a very minute record of the topography could be made.

When all obtainable information had been gathered, either in one pass or more, sufficient propulsion would be applied to boost the rocket past the neutral point, whence would begin the long fall back toward earth.

Corrections to the path would undoubtedly be found necessary. The returning spaceship must be aimed rather precisely toward the thin skin of the earth's atmosphere. An error in one direction could cause the craft to plunge deeply into the air, with cremation the inevitable end for the occupants. An error in the other direction would not be so serious. The rocket would miss the atmosphere and would take up a highly eccentric elliptical orbit. If sufficient oxygen were aboard to sustain the life of the occupants for several more days, the rocket would return on the same path and opportunity for an additional correction would arise.

If all has gone well, however, the space travellers would make the proper adjustments to the orbit, and the ship would graze the atmosphere at an altitude high enough so that the skin temperature would remain below the maximum allowable value. The rocket would glow a bright red all over, however, and the pilot would have little or no visibility. The altitude control would be from a thermometer, not an altimeter. When the maximum skin temperature was reached, the pilot (human or automatic) would cause the wings to bite into the air to maintain this temperature. Initially the natural celestial ellipse would tend to carry the craft deeper and deeper into the atmosphere. If the orbit bit too deep, positive (upward) lift would be required. On the second half of the elliptical path, the altitude would tend to increase. The rocket would then be turned upside down, that is, the earth would be above the pilot's head, and the craft would attempt to perform what would amount to a loop the loop *around the earth*.

Depending on its wing area, the rocket would or would not be able to remain within the earth's atmosphere against the centrifugal force tending to force it back into outer space. If the designers had economized on wing weight, the spaceship would not have enough "lift" (downward), and the craft would ascend upward and enter a new elliptical orbit. The amount of speed lost in the braking manoeuvre would determine how far out into space the rocket would go on this next orbit. The time required could vary from about an hour to nearly ten days before the ship would again re-enter the atmosphere for a second braking.

This process would be repeated until the rocket had slowed sufficiently for the combination of a deeper bite into the atmosphere and reduced centrifugal force to allow the rocket to remain within the atmosphere. Only one circuit of the earth then would be required to reduce the speed to a point where a normal landing could be effected.

Because of the difficulty in predicting the landing point, provision would have been made for landing in the sea. Means would have been furnished for the crew to escape by parachute in the event that a crash landing in unfavourable terrain could not be avoided. The rocket would land at about 65 mi. an hour as a conventional glider.

Rescue and recovery operations would be initiated by the ground establishment, based on latest information from the tracking stations.

The first voyage around the moon might well take place as described above. If the calculations of the scientists were correct, and if the equipment developed by the engineers functioned to perfection, the space adventurers would be delivered,

Fig. 9.—The moon-circling rocket (right) standing on its launching platform; and (left) at a height of about 40 mi., where the large first stage falls away and second-stage propulsion begins

safe and sound, to the tender mercies of a grateful and enthusiastic public. Otherwise the scientist must recheck his figures, the engineer return to his slide rule and drawing board and the personnel department must review again its applications for the job of space pilot.

The voyage *around* the moon may well be the most ambitious to be attempted using chemical fuels. If, however, it is desired to make a *landing* on the moon, and return again to earth, a rocket must be capable of completely braking its fall onto the moon, and "blasting off" again at practically the full lunar escape velocity of 7,750 ft. per second. The total equivalent velocity required is 15,500 ft. per second or approximately another factor of ten in mass ratio.

This could possibly be achieved by shooting up into the orbit ten propellant-carrying rockets for every one used in the circumlunar voyage. From 80 to 100 such rockets would be required in all. Ten second stages would be required in all. These ten second stages would be fastened together to make a first-stage booster for an eleventh, which in turn would carry the winged rocket.

There appears to be no fundamental reason why such a procedure should not work. However, there seems to be some reason to hope that by the time the circumnavigation of the moon has been accomplished, a new form of rocket propulsion might have been developed.

The Atomic Rocket

Although storytellers long before the time of the atomic bomb were looking forward to the use of atomic energy to propel their spaceships on trips through outer space, atomic energy has so far contributed not one whit to the solution of the propulsion problems of interplanetary flight.

The reason for this is fairly evident. The only method that has been devised so far for releasing nuclear energy in a controlled fashion is through the use of a reactor or pile. In this device, the energy is released as heat. The energy is contained originally in the flying fragments of the uranium atom after fission takes place. These fragments transfer their energy to other material in the pile by collision. The atoms of other material collide with additional atoms, in a billiard-ball type of chain reaction, until the whole mass of the reactor is heated. The temperature at which the heat is finally drawn off for utilization is limited by the melting or softening point of the reactor materials. No one has yet devised a reactor that requires no solid materials. It seems fairly safe to assume, therefore, that a nuclear reactor as presently conceived will not provide heat at a temperature higher than about 8,000° F. (the vaporization temperature of graphite, which is the most refractory substance known). It is very probable that the highest temperature attained in practice might be considerably below this.

It has been noted previously that the thermodynamic performance of a rocket (measured by its exhaust velocity) depends on the molecular weight of the exhaust gases, on the combustion chamber pressure, and on the chamber temperature. With ordinary rocket propellants, temperatures of more than 5,000° F. can be produced. The exhaust velocity varies with the *square root* of the temperature and inversely as the square root of the molecular weight. That is, to get *twice* the jet velocity we must quadruple the temperature, or reduce the molecular weight of the exhaust by a factor of *four*. It is apparent that even if nuclear energy could provide 8,000° F., only a small gain in performance would be realized.

Oddly enough, the greatest promise of nuclear energy in this connection is not that it will permit higher temperatures to be attained, but that it will permit a reduction in the molecular

weight of the exhaust. In searching for an ideal chemical propellant combination for the rocket engine, two conditions had to be met, simultaneously. Not only did the products of reaction have to be of low molecular weight, but the reaction itself had to be very vigorous. If the energy could be supplied from an atomic pile, a wider selection of propellants (usually called "working fluids" in discussions of nuclear rockets) would be possible. Pure hydrogen could be used. An exhaust velocity in the neighbourhood of 20,000 ft. per second could be obtained at a temperature of 5,000° F. using hydrogen.

The difficulty with hydrogen is connected with its very low density. With pure hydrogen, the problem of the weight of the tank to hold it is even more aggravated than in the case of the fluorine-hydrogen propellants, discussed earlier. Liquid hydrogen has a density less than one-tenth that of water. Tanks to hold a given weight of propellant would have to be more than ten times as large for hydrogen as for liquid oxygen and hydrazine, for example. They would probably not be ten times as heavy, but their total weight would not be as small as for tanks to hold the more dense propellants. The power required to drive the pumps, moreover, would increase in the same proportion as the reduction in density.

Ammonia, or even water, would be a fairly good working fluid. Methane is also a possibility.

At present, however, it appears that the weight of the nuclear pile, the weight of the protective shielding which would be required, the radioactivity of the exhaust, and the high development costs, would nullify the possibilities of increased specific impulse. It must be concluded that nuclear fission, using existing conceptions for releasing the latent energy, cannot materially assist in reaching the goal of interplanetary flight.

Science marches with ever increasing pace, however, and if means could be found for releasing the energy from within the atom in a controlled fashion, with only gases involved in the process, a considerable improvement in rocket performance might be possible. Although present combustion chambers have difficulty in handling even the modest temperatures of chemical propellants, designers are restricted by the necessity for extracting the maximum amount of energy from the limited supply available. With the abundant supply postulated for nuclear propulsion, the technique known as "film cooling" could be used more freely. Film cooling involves the injection of inert fluid—usually excess of fuel—along the walls of the combustion chamber and nozzle. This material forms a blanket of comparatively cool gas near the walls. By this means the walls are protected, but the average gas temperature is reduced. If additional energy were available, the temperature of the gases nearer the axis of the motor could be raised, and the average temperature kept constant or perhaps increased with a corresponding salutary effect on performance.

Through full use of film cooling, perhaps by injecting *all* of the working fluid along the walls, and by using a very hot core near the source of energy, it has been estimated that effective temperatures as high as 30,000° F. might be utilized. In such an atomic rocket, exhaust velocities as high as 40,000 ft. per second could be obtained. With such performance, two-way trips to the moon would become easy. Voyages to Mars and Venus would be no more difficult than orbital flight with chemical propellants. Truly the whole solar system would be opened for exploration under a determined program.

Territory for Exploration

The solar system contains many bodies of great scientific interest. There are the "terrestrial" planets Mars and Venus, which seem most suitable for eventual colonization. There are the huge planets, Jupiter and Saturn, on which most unusual

Fig. 10.—Orbital refuelling. A winged around-the-moon passenger rocket with second-stage booster being refuelled from fuel rockets

conditions would certainly be found. There is the tiny inner planet of Mercury which is as hot as molten lead on one side and near absolute zero on the other. There are the outer planets of Uranus, Neptune and Pluto, so far away from the sun that it appears only as a point of light in their skies.

Many of the planets have moons, some of which are larger than our own. Altogether Saturn has nine moons; Jupiter, eleven. Two of Jupiter's moons, Ganymede and Callisto, are larger than the planet Mercury.

In addition to the planets and their moons, there are a very large number of smaller bodies known as asteroids which vary in size from tiny objects up to a fairly respectable diameter of 480 mi.

Ad Astra

When men have exhausted the possibilities for adventure and satisfied their curiosity regarding the solar system, they can proceed onward to the stars. This may sound like a fantastic prediction, but we can, even today, visualize in broad outline

how it might be accomplished.

The nearest star, Proxima Centauri, is roughly 25,000,000,000,000 (twenty-five trillion) mi. away. If a spaceship could travel with the speed of light, it would still require more than four years to travel there from the earth. At the escape velocity of seven miles a second, considered barely attainable with chemical rockets, it would require 100,000 years to reach the nearest star. Obviously very much higher speeds would be required if such a journey were to be made in the span of a single human life. Curiously enough, speeds approaching that of light are not necessarily beyond the realm of sober speculation. Not only would such speeds reduce the elapsed time for a round-trip journey, as it would appear to an earthy observer, but a peculiar consequence of relativity would make time itself run more slowly for a person travelling on the spaceship. This phenomenon could lead to bizarre results. For example, an astronaut could climb aboard his interstellar craft, be whisked

at very nearly the speed of light out to some convenient star, examine the surroundings briefly, and return to earth in a matter of days, or so it would seem to him. On arrival home, however, he would be greeted at the door by his grandchildren, grown gray awaiting his return! Such a feat would require higher acceleration than the human body can stand, means for converting mass to jet energy with almost 100% efficiency, and some other, more minor, innovations, at present seemingly impossible, perhaps, but worthy of consideration for the future.

It can be imagined, for example, that some form of ionic rocket might serve for voyages to some of the nearer stars. In principle, the ionic rocket would resemble particle accelerators, the atom smashers used as tools of modern nuclear physics. These machines use magnetic or electric forces to accelerate charged particles. In a sense, a particle accelerator is a rocket having a very low thrust and extremely high "jet" velocity. Particle speeds approaching that of light are not uncommon. For propulsion purposes, the problem would be to increase the thrust (by a factor of millions) and to supply the enormous energy requirements. Although we do not know exactly how to do either of these at present, no fundamental impossibilities are apparent.

Certainly interstellar voyages are not just around the corner, but the sciences of rocketry and nuclear physics are still in their infancy.

Problems of Human Survival

Space travel presents other problems than that of propulsion. A reasonable assurance of survival of the space travellers must be provided. Space is a rather hostile environment. It is true that sunlight is there, but even this blessing must be received with care, for the direct rays of the sun in space are rich in ultraviolet. A nasty sunburn could result from even a moderately short exposure. Fortunately, ultraviolet rays are comparatively easy to filter out. Ordinary window glass does this efficiently, but most transparent plastics do not, so care must be used in selecting glazing for portholes or for space helmets.

The most insistent of man's environmental requirements is the need for oxygen. The body can exist without an external supply for only about two minutes before losing consciousness.

The human body also requires external pressure for survival. Aeroplanes are today flying at altitudes too great to permit survival without artificial aids. The simplest means for providing the required pressure and the oxygen is to completely enclose the crew in a pressure-tight container. This is done in modern commercial and military planes today.

The possibility always exists, particularly in military aircraft, that the pressure cabin will be punctured. If this occurred at very high altitudes the crew would die before the aeroplane could be brought down to a safe height. As a precautionary measure, full pressure suits are being developed, although none is yet completely satisfactory.

The possibility of cabin puncture also exists in a space craft, for there are meteors whizzing through space that could easily puncture the light skin of a spaceship. The absolute density of meteoric particles is, however, very low, and the larger ones are extremely rare. It has been calculated that a spaceship making a round trip to the moon would have only one chance in 10,000 of being struck by a meteor large enough to penetrate its hull. Small holes could be detected and patched. One way to reduce the hazard caused by small meteors would be to install outside the cabin envelope a second skin, or "meteor bumper." Small meteors striking this bumper would penetrate it, but would be vaporized in the process, so that the pressure hull would not be penetrated.

The over-all possibility of meteor damage appears so small,

however, when compared with other hazards of a journey into space, that it would probably be ignored for early ventures.

One of the hazards of space is the presence of primary cosmic-ray particles. These very energetic particles, the nature of which is not yet entirely understood, enter the earth's atmosphere with energies of billions of electron volts. As they strike atoms of nitrogen and oxygen in the atmosphere, they smash these atoms into smaller particles. These particles in turn, having received much energy from the collision, strike other atoms and cause further disintegrations. This "cascade" effect continues until the energy has been dissipated to a point where the individual particles can no longer cause disintegration of atomic nuclei.

In space, beyond the protective blanket of the atmosphere, the primary particles would penetrate the spaceship and the bodies of the crew members. Such a ray, striking an atom in the body, would start a cascading shower. It should be remembered, however, that there are billions of atoms in the body, and a few shattered atoms would probably not be harmful. However, when a particle strikes the nucleus of a cell, it seems possible that damage to the entire cell could result. In spite of this, scientists are inclined to be optimistic about the cosmic-ray problem, since, although the energy of individual particles is very high, the total energy density is extremely low, approximating that of starlight. It is difficult to visualize how such a small amount of energy could create any significant over-all damage to the human body.

Much has been said about the "terrible cold of space." This idea of the temperature of space is a misconception, however, for temperature is, by definition, a measure of random molecular motion. In a perfect vacuum there would be no molecules, hence no temperature. The word can have meaning only with reference to a *body* in space. Because of the almost complete absence of other matter in space, heat transferred to or from an object placed there would take place almost entirely by radiation.

The amount of heat absorbed by an object would depend on its reflectivity. A shiny object would receive very little energy, whereas a black object would absorb about $1\frac{1}{2}$ kw. for every square foot of surface exposed to the sunlight. The amount of heat leaving a body would depend on its temperature, and in a factor called emissivity, which is closely allied with reflectivity. An inert object in space would reach an equilibrium temperature which would depend on its emissivity and reflectivity. A method suggested for controlling the temperature of a spaceship is to paint one side black and leave the other shiny. If the temperature were too cold, the black side would be rotated to face the sun; if too hot, the shiny side would be faced toward the source of energy. Intermediate values could be obtained by positioning the ship so that part of the surface receiving the sun's rays was black, and part shiny.

Since the spaceship would probably have an internal source of energy, and since the amount of heat radiated back into space would be relatively low, it appears more probable that the spaceship would be heated internally, and like a well-insulated house, would require but little energy for this purpose.

Another popular misconception is that the human body would not be able to withstand the terrific speed of 25,000 mi. an hour. A little reflection shows that speed itself has no effect on the body. The surface of the earth is moving around its axis with a speed of about 1,000 mi. per hour at the equator, and the earth itself is travelling around the sun at a velocity approaching 70,000 mi. an hour. It is not the speed that the body reacts to, but the starting, stopping and change of direction.

Fig. 11.—The manned station in space, with two winged rockets shown moored to the centre, or hub, section (above). The rim of the wheel is made up of empty rocket booster tanks; it contains living quarters, laboratories, etc.,

as shown in the cut-away view below. Floating above the wheel is the solar power station, a polyethylene balloon, half of which is silvered. This is the author's conception of how the station in space might be constructed

BELL X-1, rocket-powered plane, the first aircraft officially to fly faster than the speed of sound

This problem has already been encountered in turns with high-speed aircraft. It has been found that the ability of the human body to resist acceleration depends critically upon the direction of the acceleration with respect to the body, and on the attitude of the subject—sitting, extended, etc.

The accelerations are commonly measured in terms of "g" units. One g is the acceleration resulting from the force of gravity on a freely falling object. An acceleration of one g upward would cause a man to press down on his support with a force of twice his normal weight (one unit for his normal weight, plus one unit induced by the acceleration).

It has been found that, properly supported in the most favourable attitude, a healthy man can endure accelerations up

to 15 g's for moderate periods of time without harm. Fortunately, other considerations, such as weight of propulsion equipment, would prevent the attainment of extremely high accelerations for space rockets.

The accelerations expected would be in the order of 10 g's maximum, a value readily endured.

A final and very interesting environmental condition would be the weightlessness of all matter. This condition would ensue, not only in the depths of space, but in any rocket as soon as propulsion had ceased. Although gravitational attraction would, in fact, be present, it could not be detected once the rocket began falling or coasting freely. This phenomenon would result from the fact that all bodies would be accelerating under the

DOUGLAS SKYROCKET, U.S. navy rocket-powered plane which established a speed record of 1,243 m.p.h. in 1951

Dawn of the Space Age

force of gravity in exactly the same degree.

It is not yet clear whether the absence of weight would be detrimental or advantageous. As far as is known, the only bodily process which requires weight for proper functioning is the level-sensing system of the inner ear. A constantly changing direction of gravity frequently causes nausea (*e.g.*, seasickness, airsickness). Whether absence of gravitational directivity would have a similar effect has not yet been determined. Human beings have been subjected to the condition of zero gravity for short periods. The pilot of a fast aeroplane sometimes floats in his cockpit for several seconds during a pushover. Likewise, a man jumping out of an aeroplane, particularly at high altitudes, experiences weightlessness until either his parachute opens or air resistance begins to slow him down.

So far there has been little indication that weightlessness would cause adverse physiological effects on man. Monkeys and mice were sent up in the Aerobee rocket, and experienced the weightless condition for a few minutes without suffering harm. Although there are indications that some loss of co-ordination may take place, the great power of accommodation possessed by the human body, exhibited by sailors and aviators, gives some promise that zero gravity would not prove a serious obstacle to man's existence in space.

Should prolonged exposure to free-fall conditions be hazardous or extremely inconvenient, artificial gravity, in the form of centrifugal force, might be provided. This is one reason why many designs for space stations take the form of a rotating wheel. Inside such a wheel, or "doughnut," there would exist a simulated force of "gravity" pressing all objects toward the periphery.

Certainly, unless special measures were taken, the absence of gravity could be a serious nuisance. On a spaceship, liquids would not flow, but would drift out of their containers and float around, breaking into smaller and smaller particles under the action of surface tension. Plastic squeeze bottles would have to be furnished for dispensing liquids. Items of equipment in a spaceship would have to be anchored in place in some positive fashion. Suction cups would probably suffice for many items that required frequent moving.

The absence of gravity in the space traveller's environment does not appear to be inherently dangerous. If the implications of weightlessness are fully anticipated, and its effects are provided for, the lack of gravity may actually be a source of comfort and convenience to the spaceman. One should note that the primary complaint of an aviator on a long mission is the fantastic rate of increase in hardness of the parachute on which he sits!

Stepping Stones to Space

The imaginary trip around the moon described in this article would probably not be man's first venture into space. In a sense, all long-range ballistic rockets are spacecraft. Even the small Aerobee rocket spends most of its flight time beyond any very appreciable atmosphere. The V-2 travelled through airless space for most of its 200 mi. range.

True space flight, however, is usually taken as beginning with orbital flight around the earth, and artificial satellites,

flying in these orbits, are expected to be the first spaceships. Satellite vehicles can take on many forms. The simplest and the easiest to put up into an orbit would simply be an object large enough to be seen. An inflated metal balloon or perhaps a radar reflector might be used. Such an object could weigh very little, perhaps only a few pounds. With such a satellite, it would be possible to measure air density at extreme altitudes, or to make measurements that would increase the accuracy of terrestrial mapping. It would certainly be highly useful in developing techniques for tracking the more sophisticated satellites to follow.

Larger orbital vehicles could carry instruments to measure and relay to earth such items as cosmic-ray energy and intensity, air pressure, density and composition, and the earth's reflectivity or albedo. Television equipment could be included, which would send back to earth pictures of the earth's surface and the location of clouds, tornadoes and other meteorological phenomena.

The next step would be the manned satellite. This step would result from joining the experience gained from unmanned satellites and from high performance, rocket-propelled aeroplanes. Stepwise development of these craft would lead to the means for transporting men to and from an orbiting space station.

BELL X-1A, rocket-powered plane which on Dec. 12, 1953, flew at 1,600 m.p.h. and climbed to an altitude in excess of 80,000 ft.

The Bell X-1 and Douglas Skyrocket might be considered to represent the first attempts. With them, man has flown higher and faster than ever before. Equipped with successively larger booster stages, similar aeroplanes could probe the skies to higher and higher speeds and altitudes. Initial designs could be made on the basis of predicted conditions for 18,000 mi. an hour operation, but such speeds could be approached only gradually with careful measurements providing information for redesign as necessary. The final product would be capable of taking one or more men on a round trip to an orbit and back.

The primary element of a station in space would be a pressure-tight container, or several such containers, to permit retention of a breathable atmosphere. The equipment and supplies for the space station would probably be shot up into the orbit in unmanned cargo rockets. It is possible that the empty upper-stage propellant tanks might serve as the primary structural cells for the station itself. These could be joined together in sufficient numbers to make any size station desired. In a sense, these pressure vessels could be obtained free of charge, since they would necessarily arrive in the orbit with each "shipment" of men or materials.

When finally assembled and equipped, the manned space station would be a scientific and perhaps military tool of first-rate

importance. (Fig. 11.)

One of the first measures would doubtless be to equip the station with telescopes for terrestrial and astronomical observation. With a telescope of only moderate power, very fine detail could be observed on earth. Photographs could be made of objects of interest and returned to earth by means of the winged "return rockets."

From the station, astronomers could turn their telescopes toward the heavenly bodies with renewed interest. Without the turbulent atmosphere to interfere with their "seeing," a wealth of celestial detail could be resolved with telescopes of even modest apertures. If the much discussed canals of Mars exist in fact, for example, they should be visible from the vantage point of the station outside the atmosphere.

Electronics scientists could, at the space station, conduct experiments in a vacuum of highest purity and infinite size. Cosmic-ray research could be conducted with a full supply of the primary particles. From these studies alone could come a richer and fuller understanding of the nature of matter and energy.

In the field of communications the space station could offer much. The short waves used in television and in much telecommunication travel in straight lines. Consequently they cannot reach beyond the horizon. A system of three space stations, however, receiving and rebroadcasting, could provide coverage of the entire earth.

The Reason and the Reward

We have said a great deal about the "how" of space travel. The question has been reviewed from both a fundamental aspect, from the point of view of detailed engineering and from

the standpoint of practical economics. It has been shown that flight into space, at least to the point of making a journey around the moon, seems to be within the realm of engineering accomplishment with substantially present-day techniques. It has also been indicated that such a voyage could only come as a result of a rather expensive program.

The people of the civilized world, and of the United States in particular, have demonstrated the ability to bring to successful completion tremendous feats of engineering. Given sufficient motivation, there appears almost no limit to what can be achieved.

Interplanetary travel would probably be the most stupendous adventure upon which mankind ever embarked. The moon and planets represent new frontiers, more strange and exciting than any new land ever before laid open to exploration. No material wealth that could conceivably be brought back from another world could ever compare in value with the new knowledge that would result from exploration of the heavenly bodies. The knowledge itself would be insignificant in value compared with the tremendous stimulus that would be injected into our civilization.

Perhaps such a new outside interest would reduce our preoccupation with our own atomic destruction. The reasons for exploring the universe, therefore, are concerned not so much with man's *ability* to exist, but rather with the *fullness* of his existence.

Interplanetary travel would add an entire new dimension to our conception of the universe around us. With the announcement in July 1955 of the first satellite program, it might be considered that the conquest of space has truly begun. Fascinating results are sure to follow.

William Benton Reports on the Voice of the Kremlin

Some first-hand observations
on red propaganda techniques
within the U.S.S.R. and Satellites

WILLIAM BENTON, publisher of *Encyclopædia Britannica*, spent part of the autumn of 1955 visiting the Soviet Union, Poland, Hungary and Czechoslovakia, accompanied by his wife and 13-year-old son John, and also with a Russian-speaking assistant and interpreter. The Bentons are believed to be the first such family group from the West to be given visitors' visas for Russia since before World War II.

Mr. Benton sought to observe and study some of the methods used by the Communists to indoctrinate the Russian people and others under their control. To such a study, the editors of *Britannica* feel that he brought unique qualifications. He has spent the 35 years of his adult life in the fields of communications, education and public service. He founded a major advertising agency, Benton & Bowles, and retired from it in 1936, at age 36. He served as a part-time officer of The University of Chicago for eight years. He became U.S. Assistant Secretary of State for Public Affairs in 1945, and organized America's first peacetime program of international information, including the launching of the *Voice of America* and its Russian-language broadcasts. He was one of the founders of UNESCO (United Nations Educational, Scientific and Cultural Organization) and served as chairman of two U.S. delegations at UNESCO conferences. In 1948, he headed the U.S. delegation to the U.N. Conference on Freedom of Information.

As United States senator from Connecticut from 1949 to 1953, one of his early major proposals was that the United States develop what he called a "Marshall Plan of Ideas."

When *Britannica's* editors invited Mr. Benton to write a report on Russian propaganda and indoctrination techniques, a major but little understood arm of Soviet policy, he accepted with the following caveat:

"First, I shall do all I can to assemble and study available data, both in the United States and Great Britain. Then I shall visit Russia and some of the satellites. However, no one, no matter how well prepared, can tackle this subject and expect to produce a rounded and balanced report which meets the high standard of scholarly accuracy *Britannica* seeks. For example, there is no way of checking the reliability of information and statistics given by Communist government officials and publications. Even riskier than the judgment of such material is the assessment of public attitudes and opinion. This latter effort is beset with pitfalls even in western countries and under the best conditions. In Russia, it is impossible for a foreigner to do better than hazard guesses. Mine I hope will be informed guesses, even educated guesses, but manifestly no visitor can know for sure what is the reaction of a kolkhoz manager to the Soviet propaganda, or even of a youngster in a *tekhnikum*.

"Western diplomats stationed behind the Iron Curtain, who for years have studied the unfolding techniques of the Communists, differ on the depth and the breadth of Marxist-Leninist-Stalinist indoctrination. Some experts think the degree of loyalty to Communism varies in inverse ratio to the privileges and economic status of the individual; e.g., the higher the educational and economic level, the greater the degree of loyalty. Experts will argue on both sides of such a question as the attitudes of the Poles towards the Russians and how these attitudes will affect the amount of pressure the Polish people will stand before breaking into open revolt. Yet it is imperative on hundreds of similar questions that we reach the best judgment we can. Thus although I shall approach the writing of this report with humility, I shall submit it for publication with no apology."—EDITORS' NOTE.

FOR thirty-eight years, ever since the Revolution of October 1917, the Kremlin has been conducting the most stupendous experiment in psychological manipulation ever attempted—with the entire population of the Soviet Union as subjects.

There is a century of history behind the experiment. For Communism is itself the child of propaganda. Communism began as propaganda and its growth is inconceivable without propaganda. Modern Communism was launched by a pamphlet, *The Communist Manifesto*, one of the most striking pieces of political pamphleteering in history. The *Manifesto* was published in 1848 by two German social theorists, Karl Marx and Friedrich Engels. For the next half century the ideas of Marx and Engels were kept alive, with little or no organization, backing or support, by the propaganda of their disciples. Marx and Engels had not concerned themselves seriously with problems of organization, strategy or tactics. They dealt most earnestly with ideas. Ideas are the weapons of propaganda.

On Nov. 7, 1955, on Red Square at the great annual celebration of the anniversary of the Revolution, I heard the speaker of the day, Lazar Kaganovich, one of the 11 members of the Presidium, shout:

"Revolutionary ideas know no frontiers; they travel throughout the world without visas and fingerprints. When Marx and

Engels issued the 'Manifesto of the Communist Party' there were no radios, no telephones, no aeroplanes. But the immortal ideas of Marx and Engels penetrated into all corners of the world and into the consciousness of the working masses of all countries of the globe. All the more so in the 20th century, the great ideas of Marx, Engels, Lenin and Stalin, which have gripped the world, have been and will be victorious. . . It is precisely the strength of these ideas which explains the fact that in October, 1917, our party, which had only 240,000 people—a drop in the sea of the people—led millions of workers and peasants to storm capitalism, to defeat capitalism and the landowners."

Nikita S. Khrushchev put this more succinctly in his visit to Burma in Dec. 1955. He said, "Ideas can't be stopped by rifles."

Nicolai Lenin, a Russian disciple of Marx and Engels, who founded the Communist Party as we know it today, and who conceived it as a tightly knit, strongly disciplined, conspiratorial body, wrote as far back as 1905: "Propaganda is of crucial importance for the eventual triumph of the Party." A professional revolutionary, agitator and organizer, he thought of propaganda as the chief instrument by which he could attain his goals. He himself was a propaganda genius.

WILLIAM BENTON, MRS. BENTON AND JOHN in Moscow. Mrs. Benton had suffered a leg fracture several weeks before their departure

During the long years of his exile from Russia, before his dramatic return in 1917, he was forging a party around himself. For this party he developed a revolutionary doctrine. Lenin's only weapons during this period were the written and spoken word. He had no other way to impose his ideas on anyone. Through his skill as a debater, his deftness with the pen, which found expression in *Iskra* ("Spark"), a newspaper he published, and through his output of polemical pamphlets, he rose to the leadership of the revolutionary movement which destroyed the Czars and achieved supreme and absolute power in Russia.

"Without a revolutionary theory there can be no revolutionary movement," Lenin said. Thus Communist Party leaders have been theoreticians as well as men of action; they have sought to persuade the Russian people and the world that Communist doctrine is the only means to salvation.

While Lenin perceived that theory could serve as a formidable striking weapon against his enemies, he also recognized theory as an instrument of discipline within the Party itself. Those who hold control of the complex theory of the Party also control the interpretation of that theory, and thus they control the policies and actions carried out under the theory. Acceptance of the basic Party dogma by the members winds up as total conformity and obedience.

Lenin continuously stressed the primary role of propaganda and agitation as instruments to win intellectual converts and to prepare the masses for the Revolution. In his pamphlet of 1901, *Where to Begin*, he emphasized the role of propaganda. In 1902, in *What Is to Be Done*, he said: "We must go among all people as theoreticians, as propagandists, as agitators and as organizers . . . the principal thing, of course, is propaganda and agitation among all strata of the people." The Party itself, as the most thoroughly indoctrinated and disciplined element in the population, was to serve, in Lenin's words, as "teacher, leader and guide" of the masses.

The success of the Bolshevik Revolution of 1917, according to Lenin, was due to the Party's ability "to combine force and persuasion." This combination is not unique in history. Cer-

tainly force has been a major factor in most historic crises—and not least in the fall of Czarist Russia. It was the degree of emphasis on persuasion, however, and its deliberate and systematic character, that was the distinctive factor in the success of the Oct. 1917 Revolution.

The combination of coercion with persuasion has remained the hallmark of the Soviet rule ever since 1917. Seizure of the power of government by the Communists did not obviate their need for propaganda; on the contrary it placed an even higher premium on it. In order to consolidate the victory of the Revolution, the deeply ingrained habits and attitudes of whole populations had to be eradicated and replaced with new ones; and that could not be done merely by force and coercion. Lenin said that the Communist regime must be prepared to sacrifice two whole generations. He anticipated the thorough indoctrination of the third. Today, it is Lenin's third generation that is surging through to power.

Joseph Stalin, first editor of *Pravda*, who followed Lenin at the helm of the Communist Party, subscribed fully to Lenin's doctrines in the field of propaganda. Although Stalin's regime became notorious for its repressive measures and its use of terror, Stalin pursued the path of persuasion as relentlessly as he conducted his purges. In his lecture on "The Foundation of Leninism," in 1924, Stalin said, "The masses, likewise the millionfold masses, must come to understand this need (for the overthrow of the old order) . . . Our task is to see that the masses shall be provided with opportunities for acquiring such an understanding." At the 18th Congress of the Communist Party in 1939 Stalin said that political leadership is "the ability to convince the masses of the correctness of the Party's policy . . . If our Party propaganda for some reason goes lame . . . then our entire State and Party work must inevitably languish."

These views of Lenin and Stalin, via Marx and Engels, must be thoroughly comprehended by anyone who wishes to achieve even a rudimentary comprehension of the Russia which is perhaps today more obscure, more the riddle and the enigma and the mystery, than at any time since 1917.

The New Phase

When Stalin died in 1953 his heirs to power, who had been hand-picked by him as members of the Politburo (now called the Presidium), undertook to rule as a collective leadership, at least temporarily. They began to exhibit a new style of tactics, somewhat more flexible, somewhat less harsh, than Stalin's. In the field of propaganda this partly took the form of a moderation in the "hate the West" and "hate America" themes. This intensive campaign, which portrayed the United States as a "warmonger," is perhaps a noteworthy example of the fact that Communist propaganda doesn't always work. The Russian people don't like war any more than do the American people. They didn't like the sound of "warmongering America." This gave them agonizing thoughts of war. They greatly preferred Khrushchev's "spirit of Geneva" which seemed to promise peace.

Post-Stalin propaganda conceded that there was some evidence of progress in the West. For example, it said, in effect, "Comrades, let us not be arrogant; we can learn something about productivity from the West." It loosened slightly the reins on Soviet writers and artists. It permitted a limited increase in the admission behind the Iron Curtain of western visitors of whom I became one. It actually encouraged Soviet "missions" or "exchanges" sent to the West.

Because these developments seemed startling by contrast with the years since V-J Day, the western press described them and dramatized them thoroughly. This had the temporary effect of obscuring the elemental fact that (1) the aim, (2) the scale and (3) the organization of Communist propaganda remained

Benton Reports

essentially unchanged.

The aim of Communist propaganda, internationally, is to advance the Communist cause throughout the world, and thus to swell the power of the Soviet Union. Gigantic though this international effort is, it is small compared with the effort that goes into the propaganda at home in the Soviet Union and among the peoples of the satellite countries. In this article I do not attempt to deal with Communist propaganda world-wide, though the international impact of Soviet propaganda is enormous, as I first learned in my service as Assistant Secretary of State when I was responsible for combatting Russian propaganda throughout the world.

This article will deal with some aspects of the Communist home propaganda, with some of the techniques of indoctrination and with their impact. The home propaganda is a real "saturation program," dominating every aspect of Soviet life. It is employed on a massive scale, previously unknown in history. At its simplest level, it is used to mobilize the energies of the people for the accomplishment of concrete tasks, such as gathering the harvest or raising labour productivity. Such propaganda at its most useful level isn't too unlike our efforts to promote highway safety or to recruit more nurses. At its best at this level the message the Soviet government projects to its own people is no more than any government might reasonably seek: loyalty to the regime, hard work, vigilance against the enemy, belief in the future.

At its most ambitious, the aim of Soviet propaganda is so daring that we in the West can hardly comprehend it: so to condition its citizens that they think of their personal freedom, and their personal ambitions, as identical with the purposes of Soviet society. The latter of course are wholly determined by the Communist leadership.

To any American who has been sensitized to propaganda, the most striking single impression he gets as he passes behind the Iron Curtain is the all-embracing character of the effort. In America he may think of propaganda in terms of advertising, or political campaigns, or crusades for good causes, or even in terms of slanted news. In Russia he discovers that the rulers seek to convert the total culture into a giant propaganda apparatus.

The distinctive features of Soviet propaganda manifestly stem from the Communist theory of government. In Bolshevik theory the Communist Party is to be the "vanguard of the working class," and the leading force in the creation of a new society. On this premise the Party has assumed a monopoly over all means of communication. The Party is wholly intolerant of any competition. It regards itself as the repository of all truth and wisdom. It claims unrestricted authority to impose its views and its will on the people. This claim extends into the most personal and private matters of human existence.

In western nations the role of the government in guarding public and private morals is largely limited and negative. Our laws set outside limits to what may or may not be done by the individual, and punish only gross transgression of moral standards. By contrast, the Soviet government seeks to mould the behaviour of the Soviet citizen not only at work, but also at home and during leisure hours. It seeks to guide all his thoughts and attitudes—not only toward his government but also toward society in general and toward his fellow men individually, including his closest associates and even his relatives.

Soviet indoctrination is a function not only of the traditional instruments and channels of communication, the so-called mass media—newspapers and periodicals, broadcasting, motion pictures—but also of literature and art and the theatre, of schools and religious institutions, and also of farm and factory and indeed of every form of social organization. In Russia no human

activity can be justified for its own sake. All must be subordinated to Communist dogma.

The Organization

To supervise its vast propaganda program the Communist Party has built an elaborate machinery of policy making, administration, control and censorship. At the top is the Agitation and Propaganda Department of the Communist Party itself—the so-called Agitprop. This is attached to the Party's central secretariat. It is headed by one of the top leaders in the Soviet hierarchy, though his identity is not always known to us. My casual acquaintances among Russian officials, cordial and outspoken on many subjects, did not respond to questions about Agitprop.

Agitprop gives central direction to all propaganda and indoctrination activities and agencies. In this it controls the press. It is also aided by a number of governmental departments, the most important being the Ministry of Culture. The Agitprop, the Ministry of Culture and the All-Union Ministry of Higher Education operate throughout the U.S.S.R. Corresponding and subordinate organs, in both the Party and the government, exist on all territorial-administrative levels.

F. Bowen Evans, in his book, *Worldwide Communist Propaganda Activities* (1955), reports:

"Agitprop has an elaborate organization with about a dozen subsections: for the Central (Moscow) Press, for the Local (Provincial) Press, for Publishing Houses, for Films, for Radio, for Fictional Literature, for Art Affairs (theater, music, painting, etc.), for Cultural Enlightenment, for Schools, for Science, for Party Propaganda, for Agitation (administrative), and for Propaganda (administrative). As a Party organ, rather than a government organ. Agitprop for the most part does not itself engage in propaganda operations. Its primary role is that of planner, guide, supervisor, and policeman over the Government agencies which actually do the publishing, filming, broadcasting, etc." (With permission of The Macmillan Company.)

The propaganda of indoctrination is so all-pervasive that it ceases to be a measurable activity, and tends to become identical with the total culture of the country. But some notion of the scale of effort within the U.S.S.R. that goes into "propaganda and agitation" is shown by Evans' estimate that in 1953 the Soviet government used 375,000 propagandists full-time and another 2,100,000 part-time. These total about the size of the U.S. army. Another 10,000,000 intellectual and professional workers were expected to engage in propaganda work as a condition of their employment. This latter figure is roughly four times the number of college students in the United States.

Throughout the Soviet Union there are about 6,000 special schools maintained by the Party devoted exclusively to training professional propagandists. These have an enrollment at any one time of 185,000 students. Above these 6,000 schools are 177 regional "propaganda colleges" to train 135,000 "alumni" of the local schools. This is 50% more than the total college and university enrollment of Great Britain. And above the regional schools are a dozen higher institutions giving "graduate training" to several thousand advanced students. Communist leaders throughout the world, such as Mao of China, Togliatti of Italy, Duclos of France, and Browder, Foster and Dennis of the United States, have attended these advanced schools.

Propaganda is by far the biggest business of the U.S.S.R., except for the Soviet armed forces. It is so much the spirit and the essence of Communism that I visited Russia in an effort better to understand it, and to prepare this article about some of the significant but little understood aspects of it. My present goal of course is merely to report some observations and incidents which will help some of us Americans to achieve greater

ROMAN CATHOLIC CHURCH in Moscow. Sen. Benton observed that he saw few persons under the age of 60 in Soviet churches

understanding of what I believe is the most terrifying competitive threat in the competitive co-existence which seems to lie ahead.

I shall concentrate here first on education because this is most fundamental and for the long pull most important; secondly, on the press; thirdly, on the use of the arts for Communist propaganda; and finally, some rather casual comments on broadcasting, the motion pictures and on my visit to three of the satellite countries. In my concluding section I seek to sum up. I also give some of my further personal observations.

Of the influence of religion I shall say only that the regime's slightly more tolerant attitude today does not mean that it is relenting in its militant atheism; it may only mean that, in Russia, religion no longer worries the Party. I saw very few Russians under age 60 in church. Khrushchev said not long ago, "Religion is still the opiate of the people, but we are strong now and not afraid of it." I fear the Communists have been largely successful in the U.S.S.R. in their antireligious propaganda, though I suspect the total success of this campaign is often exaggerated; many feel there are deep religious convictions still in the hearts of tens of millions of Russian people.

I shall pass over, briefly, the entire area of "face-to-face" propaganda which occupies such a large proportion of the trained propagandists. There are two major types. One consists in formal lectures, conducted at a fairly high theoretical level and often before large audiences. This is technically called "propaganda" by the Communists, and is the responsibility of the Society for the Dissemination of Political and Scientific Knowledge. The Society has more than 300,000 members. Its lectures range from animal husbandry to the philosophical underpinnings of Marxism-Leninism. It also publishes propaganda pamphlets. The Society claims to have organized roughly 1,000,000 lectures in 1954.

The other is called "agitation" and takes place within groups of about 10 to 15 people. Problems and ideas are handled in simplified fashion, one idea at a time. The local Party units select and train agitators. Agitation meetings are usually short sessions held at places of work. The agitator's job is to convince his listeners of the wisdom of Party decisions, and to exhort them to their best efforts. More than 2,000,000 serve

as agitators. In American sales language, this is the "merchandising at the point of sale" for which the educational system, and the mass media, have prepared the way.

I do not present many of the following observations as other than cursory. They are subject to continuous re-examination. The information I have sought for this article is not easily come by. I spent months studying the available data, both in the United States and England, before leaving for Russia. I submit the data I have assembled, my reports on interviews with high Russian officials, and my personal observations—I submit these in full knowledge that they only scratch the surface. But I submit them also in the deep conviction, after a lifetime of experience in the field of communication, that a far better understanding of this subject by the government and people of the United States is vital to our future welfare.

THE SOVIET EDUCATIONAL SYSTEM

In the Educational Institutions the Foundation Is Laid and the Basic Attitudes Shaped for Communism

"Just because we don't teach Marx in the first ten grades, please do not conclude that our lower schools are non-political. Our aim is Communist education."

This was Ivan Kairov speaking, the Minister of Education for the so-called Federated Russian Republic. This republic is by far the largest and most important of the 16 republics which make up the U.S.S.R., embracing both Leningrad and Moscow and extending from the Baltic to the Pacific. I interviewed Kairov in Nov. 1955. His ministry is responsible for the entire educational system through the first ten grades. It has instituted a ten-year program which is now compulsory in the 122 biggest cities and for about 70% of all young people; it is to be compulsory everywhere by 1960.

The ten grades are at least comparable to the average high school education in the United States. The Russian youngsters go to school six days a week and 10 months a year. Further, students at all levels work much harder than students in America. The parents know that this is the sure way for their children to get ahead. Indeed, the Soviet government felt it necessary a few years ago to pass a law prohibiting teachers in the lower grades from assigning homework for Sunday, so that the child would have one day off in seven.

"We teach history as we Communists see it," the Minister continued, and he showed me the beginning textbook in Russian history, which Soviet youngsters encounter in the fourth grade, at age 10 or 11. He explained, "The children are not introduced in any depth into the significance of the class struggle in the fourth grade, but of course they are instructed on the part played by the landlord versus the worker throughout the history of Russia. Such instruction prepares them for the concept of the class struggle which they will be taught in the higher grades, and after they finish the ten-year school."

At my request, Kairov later sent me copies of four history texts used by Soviet youngsters for the fourth, eighth, ninth and tenth grades. The text for the fourth grade, which went to press in June 1955 in a printing order of 1,000,000 copies, has for the first two sentences of its introduction: "The U.S.S.R. is the country of socialism. Our Fatherland is the greatest country in the whole world." A few lines later the introduction goes on, "Unlike other countries, the U.S.S.R. has neither capitalists nor landowners. In the U.S.S.R. there is no exploitation of man by man. We all work for ourselves, for the whole society."

The changing propaganda themes of the Soviet regime, as they are laid down by the Communist Party to fit changing

Benton Reports

needs, are hammered constantly, uniformly and insistently through the press and through broadcasting, films, the theatre and other media. But it is in the schools that the foundation is laid and the basic attitudes shaped into Communism.

It would be a serious mistake, however, to assume that Soviet education consists entirely, or even largely, of Communist indoctrination. By any standard, the educational achievements of the Communist regime have been impressive. The most striking of these has been the virtual elimination of illiteracy among people under 40. In its issue of Oct. 30, 1955, *Pravda* claimed that 60,000,000 Russians are now going to school, adult classes included.

Kairov told me that, before the Revolution, 30% of all Russians were illiterate. Mr. Palgunov, managing director of Tass, gave this figure as 65%. An American study puts it at 55%. (These differences may partially result from using earlier or later boundaries.) Advances had been made under the last Czar. A few years after the Communists took over, they threw themselves into the task of education with fervour. Their slogan seems almost literally to have become, "Education instead of butter."

Kairov told me that the first "law of Universal Obligatory Education," making four years of primary education compulsory, was passed in 1930. In 1947 the requirement was raised to seven years for urban children. The big decision to introduce universal obligatory ten-year education by 1960 for everyone was taken in 1951. The mayor of Kiev, capital of the Ukrainian Soviet Socialist Republic, in explaining to me that his city was already on the compulsory ten-year program, said that the city had 6,000 teachers to serve its 160,000 to 170,000 pupils.

By American school standards the U.S.S.R. now has a strong primary and a rapidly expanding and developing secondary system. Surprising to many Americans is the phenomenal growth of higher education. Today, according to figures which Western students of the U.S.S.R. accept, about 1,800,000 are enrolled in universities and higher institutes, and about another 2,500,000 are enrolled in the *tekhnikums*—vocational schools above the ten-year school system. In some fields, notably technological, the Soviet Union is producing graduates who compare favourably, both in number and quality, with those in the United States. Indeed, Allen Dulles, head of the U.S. Central Intelligence Agency, and Admiral Lewis Strauss, chairman of the Atomic Energy Commission, say the Soviet output of engineers and technical specialists may exceed that of the U.S. by as much as 50%. This figure becomes the more startling when one recalls that the Russian economy is probably no more than one-third the size of that of the United States, and thus, presumptively, the demand for engineers internally should be far less than in the U.S.

The Soviet educational system is designed to meet the needs of the state, not the needs of the individual. The system has two predominant goals; first, to produce trained specialists to meet the demands of the expanding state economy; second, to produce graduates with the "correct" political orientation, that is, loyal and unquestioning believers in the government and in Communism.

These two goals have not always received equal stress under the Red regime. In the 1920s, political indoctrination was the more important goal, and educational standards suffered as a consequence. Since 1945 the demands of the national economy have received the greater emphasis. Today, in the technical institutes, the Minister of Higher Education, Vyacheslav Yelutin, told me that 90% of study hours go to the students' special field of training, with only the balance of 10% to the teaching of Marxism, Leninism and Stalinism. But of course 10% over the years adds up to a great deal of studying; and, one may be

sure, 10% over the years adds up to fully adequate indoctrination by Communist standards.

Early Communist Experiments

Before the Soviet regime came to power in 1917 the prevailing educational system of Russia, modelled largely after the German, was one of the most liberal features of the Czar's government. The pre-1917 Russian schools had high academic standards. They were open to children of all classes and both sexes (though on a "separate and unequal" basis). Primary education was developed and supervised largely by the local self-government units. Most secondary and higher schools were run by the state. Only about half of all Russian youngsters of primary school age were going to school in 1914, though on the eve of the 1917 revolution the system was in process of great expansion. If only one-half the children were in school in 1914, and in an educational system which was expanding, this statistic would seem to support the illiteracy estimates of 55% or 65%.

It was not until the 1920s that the new Communist government had the time and power to formulate and put into effect a Communist educational policy. At first, this policy consisted largely in doing away with anything that came from the past. Regular subjects of instruction were abolished and a "core curriculum" substituted; entrance requirements, examinations, grades and academic degrees were swept away. All work was done in student "brigades." Testing became "collective." Each brigade had a leader who answered for the group, and the brigade received a collective mark. The authority of the teacher was considered one of the "reactionary vestiges" from Czarism. Students were allowed to contradict the teacher, or even to denounce him on political grounds. Since the students were recruited largely from worker and peasant families, while the teachers were of necessity holdovers from the old regime, plenty of friction resulted. Teachers reported that they feared denunciation if they failed to give a *Komsomol* (member of the Communist youth organization) a good grade. Standards of quality, especially in higher education, fell to a low point. The national economy was suffering because the schools were graduating second-rate technicians, rather than the top-flight engineers and scientists who were needed in the Soviet drive for industrialization.

So with the first Five-Year plan, in 1928, the government began to withdraw its previous educational "reforms" and to reintroduce examinations and individual grading. It re-established regular academic courses and reaffirmed the authority of the teacher. By 1955, education, with liberal doses of Communism added, had largely returned to the structure and standards of prerevolutionary times, but on a vastly expanded scale. However, many features are new; the system is not only universal in the primary grades, but, throughout, it is coeducational and secular. Further, it is closely and continuously geared to the demands of the national economy.

The Ten-Year School

The curriculum of the Ten-Year schools has not been greatly altered in recent years except for the new constant drive to step up and improve "polytechnic" instruction. Since many Ten-Year school graduates have considered themselves too good to work with their hands, the Soviet press continually conducts a strenuous campaign on the "joys of manual labour." It emphasizes the values of "polytechnic instruction" in the Ten-Year schools to prepare young people for work in industry and agriculture.

The hours formerly devoted to the Russian language and literature, and to psychology and logic, have been cut. Kairov

explained to me: "We are working toward a school that is general and polytechnic, all in one." Even in the first four grades, a course of study which the Minister called "The Study of Labour" has been introduced. In the city schools, shopwork perhaps similar to what in the United States is known as manual training has been added; in rural schools, gardening. This manual program is increased to two hours a week in the fifth and sixth grades. From the eighth to the tenth grades the students engage in what are called "Practicums," dealing with work techniques. All students in the last three grades must do two weeks of summer work in factories or on farms. In addition, all schools have "Voluntary Circles" for these grades, for groups interested in practical hobbies, from making radios to keeping bees. "We are trying to work out a combination of study and productive labour," says Kairov.

Youth Organizations

Against Kairov's statement that "our aim is Communist education" comes the discovery that less time is given to formal indoctrination in Communist ideology than one would suppose. All courses of all kinds, even in the natural sciences, are admittedly slanted towards so called "materialism." Yet an overwhelming percentage of the study courses goes to academic and technical training.

The schools can and do lean on the press, radio, TV and other media for continuous and daily indoctrination of the young (as well as the old). For the young, however, there is still another source of ideological indoctrination. Almost all Soviet children go into the Young Pioneers at age nine, in the third grade, and remain until age fourteen, in grade seven. Then in large numbers they enter the *Komsomol*, the youth organization for youngsters from 14 to 23. These two organizations are perhaps equally responsible with the schools for the early stages of formal indoctrination.

The statutes of the *Komsomol*, which Khrushchev claims numbers 18,000,000 members, require each member to study Marxism-Leninism; to engage in constant efforts to raise his own political literacy; to explain the political line of the Party to the masses of youth; and to provide an example of socialist attitudes toward work and study. From the *Komsomol* comes a large reservoir from which the Party can cull its future leaders and functionaries.

At any one time about 40% of the 18,000,000 members of the *Komsomol* are engaged in serious study of Marxism-Leninism. *Komsomol* leaders are continually pointed out in the Soviet press as young people who should set examples of loyalty and devotion to the regime. In the schools, they seem to carry a large share of responsibility for the maintenance of discipline and loyalty to the regime among students. If a student refuses to go to his job assignment, or shows unwillingness, the *Komsomol* representative will be the first to explain to the student why he should go. This seems to be the advanced Soviet technique of what was called "student government" when I was at college.

The Tekhnikums

Some children are siphoned off into specialized schools called *tekhnikums* at the end of the seventh grade. There they take a four-year course in their chosen vocations. Others enter the same schools after the tenth grade for two or two and a half years. In 1955 it was anticipated that the admission of seventh grade students and those under 16 would shortly be abolished.

The *tekhnikums* are not a Soviet invention, but a development from the Czarist system. There is no equivalent for them in the United States. Perhaps the best name for them in English would be vocational junior colleges. They are designed to

produce "middle-trained" specialists not only for industry, but also in music, art, medicine and education. A *tekhnikum* graduate in medicine would occupy a position intermediate between a doctor and a nurse.

The *tekhnikums* are run by the great industrial ministries such as the Coal and Coke Ministry, the Ministry of Communication, the Ministry of Agriculture, etc. One estimate placed the total number of these *tekhnikums* throughout the U.S.S.R. at "more than 2,000." This was given me by the prorector of the University of Moscow who says the total *tekhnikum* enrolment is 2,500,000.

I visited a *tekhnikum* in Kiev. This is one of 50 maintained throughout the Soviet Union by the Ministry of Coal and Coke. (The All-Union Ministry of Higher Education, however, appears to set minimum standards for all *tekhnikums*.) The principal told me that when his *tekhnikum* opened 11 years ago it had only 255 students; and that it now has 2,500 students and 85 teachers. He offers tenth grade graduates two and a half year courses in four specialties—construction of coal mines, construction of coal mine buildings, construction of roads for coal mining enterprises, and construction and use of communications equipment used in the coal mining industry.

The equipment, the models and laboratories astonished me. The principal said that the equipment, some of it covering rooms 100 feet long, was worth "millions of roubles."

The principal was particularly proud of a scale model of a "Palace of Culture" made by one of his students. A Palace of Culture is a kind of local club which is supposed to symbolize the progress of the Soviet people. There must be tens of thousands of them throughout the Soviet Union and thousands more going up all the time. The model was about 12-ft. long by perhaps 5 ft. deep, with electric lights, and a tiny simulated moving picture flickering inside. All the details of construction were visible when part of the "Palace" was lowered in order to give a cut-through. Indeed the student builder was also on exhibit, a tall, gaunt poetic-looking boy with a receding chin. I asked the principal how he could put such a boy into a coal mine.

The problem of getting boys voluntarily to apply to a *tekhnikum* in the field of coal mining interested me because I know that coal mining isn't exactly a popular career in the United States. The principal suggested that the problem is one of propaganda and promises. The boys from the Ten-Year schools are "guided" by the government into the *tekhnikums* where they are most needed. This is done by what the principal called a "process of popularization." I did not have the chance to inquire whether salary incentives were also involved; for example, whether a coal mine foreman is paid more highly than a young man who is being trained to go into journalism, which sounds, at least to me, like a more pleasant and interesting occupation.

Applicants have an opportunity, on a certain day each year, to come in and look the *tekhnikum* over, and listen to representatives of the school, before they make up their minds. I presumed that there must be those whose academic grades failed to qualify for the universities or higher institutes. But the principal says this isn't necessarily so. Some talented young people who might qualify just don't want to wait the five years of the university or comparable higher education, before they go to work. They apply for a *tekhnikum* because it takes only 40% or 50% as long. They, and others who may develop academic aptitude in the *tekhnikums*, have a second chance for the university or higher institute if they stand in the top 5% after their 2 or 2½ years at the *tekhnikum*; this 5% goes on into the higher institutes purely on the recommendation of the faculty, and without examinations. Thus the bright student in Russia can have, at the expense of the state, all the education he

wants and can absorb. However, students who go from *tekhnikum* to university or institute from this top 5% must remain in the same field in which they were trained in the *tekhnikum*.

The rest of the *tekhnikum* graduates serve at a job to which they are assigned for three years. Only after the expiration of this job assignment may they apply for admission to a higher educational institution. To be admitted they must pass the competitive entrance examinations and they must continue in the fields for which they've been previously trained. The Russians feel the need for skilled technologists too keenly to allow them the free choice to shift fields.

For most students, of course, graduation from a *tekhnikum* is the terminal point in their formal education. But many continue to struggle and strive. This is why one sees the young people in the bookstores at the sections featuring scientific works; they buy books on nuclear physics in preference to novels in order to get ahead. This is why I found every desk occupied in the great reading rooms connected with the scientific sections in the Leningrad library. The silence was absolute; the concentrated zeal of the students was a bit breath-taking; and the rooms are jammed by day with workers from the night shifts of the factories; and by night with those from the day shifts. It can't be stated too often that the surest way to get ahead in Russia is by studying and by learning. Promotion can't often be won, as occasionally in the West, by inheriting money or influence or by marrying a dowry or the right girl.

Universities and Higher Institutes

The University of Moscow, with its gleaming new 33-story tower, is, after the Kremlin itself, Moscow's most arresting structure. The prorector of the university, Professor Vovchenko, told me it cost the astonishing sum of 3,000,000,000 roubles. At the present inflated four-roubles-for-a-dollar exchange rate that would be U.S. \$750,000,000; even at the lowest estimate I picked up anywhere on the rouble, twenty-for-a-dollar, this is U.S. \$150,000,000, or more than has been spent for the physical plants of any but a handful of American universities. This greatest of the Russian universities is a symbol to all Russia of what lies ahead in the fulfilment of Soviet ambitions in the field of higher education.

Vovchenko, a chemist, told me that the University of Moscow had graduated 85,000 in its 200 years, 45,000 of these since the 1917 Revolution. It now has 23,000 students enrolled, and turns out 3,000 graduates a year. About half of all students are being trained as teachers. Ten per cent of the graduates are permitted to stay for graduate work (compared with about 5% at the University of Kiev and in the Soviet Union as a whole) and of these, after three years of advanced study, more than 90% earn the *kandidat* degree. The teaching faculty numbers 2,000, all of whom must do research, with another 500 who do not teach devoting themselves exclusively to research. (The great new building has 1,900 laboratory rooms.) The university's annual budget is 250,000,000 roubles, exclusive of construction.

Vyacheslav Yelutin, Minister of Higher Education, told me that there are 760 institutions of higher learning in the Soviet Union, but these do not of course include the *tekhnikums*. Vovchenko estimated that 1,825,000 students are enrolled in these higher institutions. (In the United States, about 1,850 institutions are in the "higher education" category, with 2,533,000 students, and of course there are no *tekhnikums*.) If we add the *tekhnikum* enrolment, we reach a total for institutions beyond those comparable to high schools in the United States of more than 4,300,000—or almost double the post-high school enrolment in the United States.

In the U.S.S.R. there are three basic types of higher educa-

tional institutions: the university, the institute (the latter category including technical, medical, legal and other specialized schools, but excluding the *tekhnikums*), and the pedagogicals or teacher-training institutes.

According to Soviet sources about 90% of all students in these higher institutions are on state scholarships, with the amounts of the scholarships increasing slightly every year that the student remains in school. This largely removes from Soviet education the factor of the economic status of the parents which is so important in the U.S. in determining the educational advantages and advancement of the young people. The fact that, generally speaking, in the U.S.S.R. a student can keep going, at the expense of the State, as long as he can make the grades—this fact is profoundly important when the present Soviet development of its potential manpower is weighed against and compared with the practices in the U.S.

The U.S.S.R. scholarships are fixed by the Ministry of Higher Education and they vary in amount from field to field. There must be a technique of persuasion, as in the *tekhnikums*, to channel students into the fields of greatest need, as judged by the State. The larger sized scholarships will encourage students to enter in sufficient numbers those fields to which the government gives high priority (for example, scholarships in mining and aeronautics are very high, but scholarships in history are almost negligible).

After a male student has been accepted at a higher educational institution, he applies for draft deferment, which is apparently automatic. This Soviet draft deferment policy has never been explicitly stated by the government. Before 1939 all students were exempt from military service. After 1939 all youths from the age of 18 were made eligible for the draft, but it appears (from testimony of displaced persons) that most students attending schools of higher education obtain deferments not only during their period of study, but also after graduation. Instead there seems to be, especially for students in the fields of science and engineering, some sort of R.O.T.C.-type training: summer camps and military courses are included in the curriculum. On graduation these students are commissioned in the reserve. The draft deferment policy, and the exact nature of the military training given, are never mentioned in the Soviet press. The Soviet policy, however, is manifestly designed to utilize youth and manpower so that its sum-total productivity will bring maximum benefits to the State. This policy, in my judgment, as it increases in effectiveness, poses a most serious threat to the West, dangerous in war because of its efficiency, and ominous in any form of competitive co-existence we can envisage. The victory in such competition between the U.S.S.R. and the West in areas like Asia and Africa may well go to the largest battalions of technologists trained for export.

The academic load of the average Soviet college student sounds far heavier than in the U.S. Further, Yelutin explained to me that the higher institutions draw their students from the entire population, and not from any particular segment. He said there are perhaps 100,000,000 workers in the U.S.S.R., of whom perhaps 20,000,000 could be called "members of the intelligentsia." And of the total enrolment in higher institutions, Yelutin says, about 20% come from "intelligentsia" families. He commented, "In admitting students, we don't ask who the father is; we want a clear head."

The U.S.S.R.'s 33 universities are directly under the jurisdiction of Yelutin's ministry. A typical Soviet university has 12 "faculties"; for example, in physics, mathematics, language, literature, history, biology, geography, chemistry, philosophy, economics, law and journalism. The two universities I visited, Kiev and Moscow, two of the three most important, have six faculties in the natural sciences and six in the humanities and

social studies.

If a student is accepted for graduate work, his three years will follow an individual study program which is worked out with his adviser. This is the first time in the Soviet educational process that the student is not following the uniform study plan laid down by the government.

Graduate work in the U.S.S.R. is also offered by the research institutes of the Academy of Sciences. The Academy controls and directs nearly all basic and theoretical, and much of the applied, research in all scientific fields in the U.S.S.R. The distinction between doing graduate work in a research institute and in a regular academic institution is not clear to me. However, Vovchenko told me that members of the Academy of Science serve on the Learned Council of the University of Moscow.

The first graduate degree, the *Kandidat Nauk* (Candidate of Science), calls for a level of training roughly equivalent to that of the Ph.D. at a good university in the United States. The second, and the highest, Soviet academic degree, *Doktor Nauk* (Doctor of Science), is not predicated on any formal plan of study but requires a successful defense of a Doctor's thesis which involves an original and significant contribution to science. The degree of Doctor of Science may take 25 years for the holder of the *Kandidat's* degree to achieve, and many *Kandidats* are said to spend their lives striving for it without success. There is no such super-advanced earned degree in the U.S. and if my information is correct, our Ph.D. from many departments in many universities is, by comparison, a diploma from a junior college.

Yelutin explained that the pedagogical institutes, for teacher training, are under the direction of Kairov's Ministry of Education; that the medical institutes (of which there are 90) are under the Ministry of Health; that the 100 or more agricultural institutes are under the Ministry of Agriculture; the 200 or more technical institutes are under various economic

ministries. However, Yelutin's ministry serves as what he called a "kind of legislative organ for all institutions of higher learning." As Minister of Higher Education, he says, "I follow out the orders issued by the government and also put out additional regulations of our own."

Among Yelutin's responsibilities is certification of all degrees. He confirms and approves all teaching plans and curriculums. He also has a right or privilege which seems odd to us, and which must be important to the control he exercises. Only he can authorize putting into a book the phrase, "This is a textbook." No university or institute can do this; only the Minister can do it for them. The book publishers, he says, can put out what they may regard as textbooks—but they can't say, "This is a textbook."

Yelutin's ministry appoints the rector (or director) of each higher institution. Under the rector are two or three deputies: one for academic administration, one for general administration, and the third for Party affairs. The latter has much to say in the matter of personnel selection and policies. Highly important by our standards is the fact that no university professor has permanent tenure. Any professor can be fired at any time when the authorities, who are politically appointed, judge his work to be unsatisfactory. Each university faculty has a "Learned Council" with some powers; but no one seems clear about how much power. It is clear, however, that the appointment of their members must be approved by the Ministry of Higher Education.

The entire question of how rigidly and to what extent the Soviet educational system is centrally administered is not clear. The relaxation of control since the death of Stalin has been evident in education as well as in other fields. For example, there is today wide academic discussion of a so-called "new charter" under which the rector of a university will in future be elected by the Learned Council by secret ballot. But there is no discussion of changing the requirement calling for the approval by the Minister of every professor elected to any Learned Council, nor did I hear of any discussion of any extension of tenure in their jobs to scientists and scholars.

Of foreign students Yelutin said, "We are willingly going in the direction of taking more foreign students. When other governments ask us we respond positively." Yelutin continued, "the financing of these students varies. One system of financing is mutual exchange between countries. We have this kind of arrangement with Norway and Finland, for example. Sometimes the students are financed by their own governments. Now there is talk of using the United Nations funds for backward countries to finance students. We expect Indian students here who will be financed by these UN funds." The Minister added that it is "difficult to overestimate the importance of this exchange of students."

There are of course thousands of foreign students in the U.S.S.R. Even in the satellites, there are many. Professor Urduig-Gruez, Minister of Education in Hungary, told me there are between 200 and 300 Korean and Chinese students in Budapest. When I asked him what they were studying, he replied, "Many are specializing in the Hungarian language and literature." On this I can only comment briefly that Generalissimo Mao must be looking a very long way ahead.

Of the 60,000,000 students *Pravda* claims, I do not know what proportion are in the institutions for formal education, in contrast with those engaged in what we would call "adult education." The percentage of the latter must be substantial, and notably through correspondence courses. In the U.S.S.R. adults keep at their studies because diligence and industry pay off in the form of advanced education and certificates and diplomas and the rewards that accrue therefrom.

Summary of Soviet Aims

Perhaps a quick way to conclude this key section in this article, and to summarize the aims in Soviet education, is to quote from the *Great Soviet Encyclopaedia*. Its editors are instructed to produce the final instruction on "the Marxist-Leninist-Stalinist outlook." Their task is regarded as of such supreme importance that they report directly to the top Council of Ministers.

In their special volume devoted to the Soviet Union, published in 1948, they imprinted Kairov's views on the duty of the schools to provide the Communist education. The Soviet encyclopaedia progresses as follows:

"To develop in children's minds the Communist morality, ideology and Soviet patriotism; to inspire unshakable love towards the Soviet fatherland, the Communist Party and its leaders; to propagate Bolshevik vigilance; to put an emphasis on atheist and internationalist education; to strengthen Bolshevik will-power and character, as well as courage, capacity for resisting adversity and conquering obstacles; to develop self-discipline; and to encourage physical and esthetic culture."

This definition of aims of Soviet education is exactly in line with the subjects of all articles in the 50-odd volumes of the so-called "Great Soviet Encyclopaedia." I spent more than three hours with the editor, B. A. Vvedenski, and with four of his top associates. This subject is naturally of special interest to me as publisher of the *Encyclopaedia Britannica*. The *Great Soviet Encyclopaedia* serves to illustrate how the publishing of all books in the U.S.S.R., as with all other media of communication with the people, is directed towards the furtherance of the aims of the Party and the State.

The creation of "the new Soviet man" is to be brought about not only by the teachers in the course of the schooling period, but also by the whole system comprising the Pioneer and Youth organizations, as well as by the Pupils' and Parents' committees.

The ideological fare doled out in schools today is limited and is accomplished chiefly through the courses in history, literature and geography. One reason no greater indoctrination pressure seems required from the lower schools is that the student is surrounded by the government propaganda, everywhere and on all sides, wherever he looks and in whatever he reads.

Some further and more detailed comments by Mr. Benton on the Soviet Educational System

The Ten-Year School

The Ten-Year school is subdivided into a primary school (classes 1 to 4); an incomplete secondary school (classes 5 to 7); and a complete secondary school (classes 8 to 10). These subdivisions correspond roughly to the U.S. elementary school, junior high school and senior high school. At age seven a child enters the first class. As in Czarist days, he wears a uniform (this his family must buy). He studies the same subjects at the same time as every other child in the republic. Scholastic demands are strenuous, hours are long and discipline is severe.

For the first three years, pupils are passed from grade to grade on the recommendation of the teacher, but at the end of the fourth class they must pass written and oral examinations both in Russian and in arithmetic in order to move into class five. From the fourth class on, they take written and oral examinations at the end of every year on a whole year's work. A student's mark for the year depends largely on how he does in his examinations. The marking is from 5 to 1 as we mark from A to E: 5 is excellent and 1 is failing; 2 is "unsatisfactory."

For the oral examinations the pupils appear before a special examining board which includes their regular teacher. The course has been subdivided into about 75 specific topics or questions. These have been printed on tickets which are placed in a bowl in the front of the room. About 20 minutes before a child is called on to recite, he is allowed to pick his ticket. When his turn comes, he stands up in front of the class and recites the answers to his questions. This oral examination procedure is used right up through university and graduate work.

At the end of the seventh year comes the first watershed in the Soviet educational process. For some students, about 30% of the total according to Kairov, and largely in the rural areas, this is the terminal point of their formal schooling.

At the end of the tenth class, a special examination is held. All those who pass are graduated and receive a certificate known in Russia as the *Attestat Zrelosti* (Certificate of Matriculation).

Labour Reserve Schools

A system of "Labour Reserve schools" was established in 1940 under the Ministry of Labour Reserves to provide a "continuous stream of labour for industry," from both the country and city. While in Russia I asked many questions about the Labour Reserve schools but could pick up little about them. Officials seemed to intimate that they are on the decline, or even in process of being discarded. This may or may not be true.

These schools trained semi-skilled workers, largely for heavy industry, and have been a scholastic dead-end. They were filled both by volunteers and a form of draft. Every collective farm had to send two boys or girls from 14 to 17 years of age and two from 16 to 18 years of age per 100 of the population, counting males and females between the ages of 14 and 55. City quotas were reassigned yearly.

The Labour Reserve schools were run on a military pattern. The students lived in barracks, and it was a criminal offense to leave the school. Youngsters who left were subject to imprisonment in a labour colony—a forced labour camp—for a term up to one year. Tuition, room and board were free. Upon graduation a student had to work four years at an assigned job, again at the risk of criminal liability for non-attendance.

There has been considerable evidence that these schools were unpopular with young people because of the harsh military life and the almost certain lack of future. Obviously these schools provided a place for the less talented students, and there has been some evidence that the transfer to Labour Reserve schools was used as a punishment ("If you don't do better this term, we'll recommend you for a Labour Reserve school"). There were three types of Labour Reserve schools: so-called trade schools, which had a two-year course and trained semi-skilled workers, for example, miners, metal workers, mechanics and electricians; railroad schools, which had a two-year course and trained railroad workers; and schools of "factory-plant instruction" with a six-month course, which trained relatively unskilled factory, mine and construction workers.

In the fall of 1954 a new kind of technical school was opened by the Ministry of Labour Reserves—the technical academy. These schools, with a one to two year course, are built on the base of the Ten-Year school, but they are distinct from the *tekhnikum*. Admission is wholly unselective; i.e., anyone between the ages of 17 and 25 who applies is enrolled without entrance examinations and there is no tuition. The students are trained largely for work in heavy industry—the metal and oil industries, industrial construction, railroads, mining and agriculture—and the students are obligated to work on an assigned job after graduation.

Higher Institutions

The various types of higher institutions have many features in common. Largely, they draw their students directly from the Ten-Year school system, or from the *tekhnikums*.

The admissions policy for all types of higher educational institutions (referred to as *vuz* in Russian) is the same. The prospective student files an application for admission to a specific faculty (department) of a given institution. Then he must take four or five entrance examinations. For example, the required entrance examinations given by the physics faculty at the University of Moscow are in mathematics, physics, chemistry and the Russian language and literature. The only students exempt from the entrance examinations are the honours graduates from the Ten-Year school (called medallists, since they win a gold medal) and the top 5% of the students from *tekhnikums*.

Since 1940 all higher educational institutions have charged nominal tuition and compensated for it with a system of scholarships that blankets almost everyone.

While the course of study at a university or institute lasts five years, at a pedagogical institute it is only four. The curriculum for every "specialty" (major) is laid down by the Ministry of Higher Education. The courses are taught much as in the United States with lectures, laboratory work and group meetings. The 10% of every student's course-load devoted to lectures in the field of indoctrination cover the first three years only, and are devoted to Marxism-Leninism, history of the Communist Party, and dialectical materialism; all the rest of the courses are in the student's field, beginning with very general subjects and becoming increasingly specialized until, in the fourth and fifth years, the students concentrate wholly on their specialties. Very few electives are allowed, and they must be in the student's major. Thus, except for political subjects in the first three years, and a foreign language, a Soviet advanced student takes no subject outside his field. The Western idea that a physicist might want to take a fine arts course, just for his own edification and increased breadth of interest, seems wasteful to the Soviets.

Every graduate from the technical institute must serve for three years at a job assigned by the relevant ministry. He (or she) is criminally liable if he refuses to accept a designated job or if he leaves his job. (There are a few exceptions; a wife cannot be assigned to work in a different city from her husband.) The job assignment practice, although alien to the West, does not seem to be unduly resented in the U.S.S.R. Complaints, according to refugee reports, are made about particular assignments, not about the practice itself. The students' attitude, it is said, is that the State has educated them and that they are repaying the State by their work. In the student's mind, a compulsory job assignment may be an entirely acceptable alternative to a tour of military duty, from which he is exempt. The official Soviet propaganda line is: How lucky Soviet students are in comparison with American students: our Soviet students have jobs waiting for them when they graduate, while the unfortunate American graduates have to pound the pavements and haunt employment offices.

A student admitted to graduate work, in order to obtain the *kandidat*

degree, follows a course of study laid down by his adviser, and he must pass certain examinations. He must hand in and publicly defend a *kandidat* thesis. This usually takes three years after the five years of the university.

The Faculties of Higher Institutions

Higher institutions are divided into faculties (departments), headed by a *dekan* (dean), and each faculty is organized into *kafedras* (chairs). For example, the mathematics faculty at the University of Moscow is divided into the *kafedras* of mechanics, differential equations and others. It is around the *kafedra* that graduate work and university research are organized.

The highest in the academic ranks is a professor, for which rank a doctor's degree is theoretically necessary. Next comes a *dotsent* (who can be compared with an assistant professor) of whom a *kandidat* degree is required. The lowest rank is that of an *assistant* which is similar to that of our instructor.

The most important academic body in a higher educational institution is the *Uchenyi Sovet* (Learned Council). The Council is supposed to coordinate the academic and research work of the different faculties and *kafedras*. It grants *kandidat* degrees and recommends the granting of advanced degrees. However, only the accrediting commission of the Ministry of Higher Education can grant the relatively rare and highly prized Doctor of Science degree. The Learned Council also serves as a transmission belt for policy decisions from the Ministry of Higher Education. The Council does not have any control over the number of students that can be accepted annually or over the distribution of students by fields within an institution. This direction must emanate from the government or Party in line with the needs of the State.

Evening Schools

During World War II, evening schools (incomplete secondary and secondary) were established for young people whose education had been interrupted by the war. In the city, so-called Schools for Working Youth and in the country, Schools for Rural Youth were established. These schools continued to increase in number ever since their establishment in 1943-44. They have apparently become a permanent fixture.

Adult Education

There is an extensive program of adult education, both in evening schools and by correspondence, designed to serve adults who are employed and who are willing to put in long hours of extra study in order to get ahead. The courses of study are supposedly the same as in the regular schools. They are extended over a longer time period. The tuition is half that of a regular school. The extension student must pass entrance requirements. He is supposed to take correspondence training only in the field in which he is regularly employed, but it is evident that many students use correspondence education in hope it will help them eventually to change fields. An employed person who enrolls in a correspondence course is legally guaranteed time off sufficient for examinations and laboratory work. Formally, a correspondence degree is equivalent to that of a regular degree. The same benefits (increased salary and promotion) accrue to the holder, even though qualitatively the standards are not so high. One of the fields where correspondence schools have been used to great advantage is in teacher training. One of the remarkable facts of the Soviet educational system has been its success in training hundreds of thousands of new teachers.

THE SOVIET PRESS

The Key to the Understanding of Soviet Propaganda and Indoctrination

Fifty-four years ago Nicolai Lenin defined the press as an instrument for "collective propaganda and collective agitation." Further, newspapers were to be a "collective organizer." Lenin would not be disappointed in the Soviet press today. He would enthusiastically approve of its short term values and long range goals.

In separate meetings I visited with three top newspaper executives of Moscow. They exceed in power and influence any 300 American newspapermen. Colonel Robert McCormick or Roy Howard in their heydays were but cub reporters in influence by comparison with any one of them. They are not so sharp as Lenin in their language—one of them blandly commented that, after all, a newspaper is a newspaper, whatever the society—but none would question Lenin's definitions. They are experienced and sophisticated men, attractive men, manifestly able men, and because of these qualities they are potentially dangerous men to the U.S.

They were N. G. Palgunov, managing director of the Tass News Agency, the Russian counterpart of the Associated Press and the only source of world-wide and U.S.S.R.-wide news for about 7,000 Soviet newspapers; Constantin Gubin, editor of

Izvestia, second largest U.S.S.R. paper, which is the organ of the Supreme Soviet, the highest governmental body in the Soviet Union; and Yuri Zhukov, deputy editor (and foreign editor) of *Pravda*, organ of the Communist Party, and by far the largest and most powerful Soviet newspaper.

All were cordial, and on the whole, I thought, candid. All three vigorously denied that they received editorial marching orders regularly from above, or gave marching orders to the rest of the Soviet press—which is why I qualify my word "candid." All three conceded without hesitation that the Party runs Russia—including its press.

In the press as in every activity in the Soviet Union, all power is concentrated in the Party. Palgunov of Tass said, "Of course the Party directs the economic, social and cultural life of the Union. We do not deny that the Party gives the guidance, and *Pravda* is of course the central organ of the Party." Gubin, editor of *Izvestia*, also conceded at once that *Pravda*, as the Party organ, is more significant than his own paper. Zhukov told me that his chief editor, D. T. Shepilov, devotes more time to his duties as secretary of the Central Committee of the Communist Party than as editor.

I told Gubin I had been authoritatively informed that *Izvestia* and *Pravda* had differed editorially in 1954. I knew that *Pravda* had urged concentration on heavy industry, in the tradition of the Stalin era, and that *Izvestia* had called for greater emphasis on light industry and consumer goods, a view identified with Georgi M. Malenkov at that time. Gubin said the two papers could never differ—they could never have a major difference on an important issue. He said, "There cannot be any difference between the view of the Party, represented by *Pravda*, and the Supreme Soviet, represented by *Izvestia*."

Palgunov told me that there are more than 7,000 newspapers in the Soviet Union. Gubin gave the figure as 8,000—one of many evidences I received that statistics in the U.S.S.R. tend to be erratic. Of these papers, more than 500 are dailies, with a total circulation between 43,000,000 and 47,000,000. In Czarist Russia there were about 100 dailies, with 2,500,000 circulation; obviously the steep rise in literacy under the Soviet educational drive has been a factor in this increase. (In the U.S. there are published 1,785 dailies, with 55,000,000 circulation.) In addition to *Pravda* and *Izvestia*, there are 23 other so-called All-Union papers which circulate everywhere throughout the U.S.S.R. The remainder are provincial and local organs of regional and local soviets, unions, Party units, etc.

The All-Union papers are said to account for 30% of the total newspaper circulation in the U.S.S.R. Several ministries publish their own All-Union dailies. For example, the Red army publishes *Red Star*. The Ministry of Agriculture's daily is said to have a circulation of 1,000,000. The newspaper *Labour* was described as the organ of the labour unions. The *Komsomol*, the Soviet youth organization, has its own *Komsomol Pravda*. All newspapers are of course properties of the Party or the State as is everything else in Russia. All are thus propaganda organs of the Communist Party.

The Soviet press differs profoundly from that of the United States in practically everything except printing presses and paper. There is little resemblance either in purpose or execution. Palgunov handed me a volume of his lectures for the faculty of journalism of the University of Moscow, dated 1955. Here is a sample, and I concur wholly with the first sentence:

"In its character and content Soviet information differs radically from the information which is distributed by the bourgeois press. In the capitalist world the press is used by the bourgeois in order that, by misleading simple people, the capitalists might be able to impose their will upon the workers. In a capitalist society, newspaper information, like all the bourgeois

press as a whole, very frequently serves as a means of diverting the attention of the popular masses from the truly important, serious and vital problems. Thus it serves as a means of glossing over social conflicts. For this purpose the press makes a practice not only of incorrectly and tendentiously reporting the facts, but also of tendentiously selecting the facts. Ordinarily the pages of the bourgeois newspapers are filled with sensational, detailed and graphic descriptions of murders, robberies, armed raids, street manifestations, trials, scandals in high society and generally with a description of the life of the 'high society,' etc."

In the lectures Palgunov said further, "Unlike the bourgeois press, Tass is interested only in facts. The Tass reporter must follow the struggle of the classes; but he must do it objectively."

Objectivity as we in the West idealize it—the reporting of relevant facts and of both sides of every controversy—is alien to the Soviet publishing system, which is based on the doctrine that "impartiality results in the distortion of historical truth."

Being "first with the latest" is not a worry of the Soviet editor. Even major international events sometimes must wait their turn, until the Party line has been worked out. There are no "enterprising young reporters" in Soviet journalism, outdoing each other for "beats," no hard-bitten city editors; and of course no salesmen of advertising space!

Crime, if it is reported at all, is treated as a shortcoming in Soviet society traceable to the surviving remnants of capitalism. It provides the newspaper with the chance to admonish, to lecture, to point up a moral. For example, *Sovetskaya Estonia*, reporting the case of a group of "speculators" whose alleged crimes included the theft and sale of stolen goods on the black market, identified the criminals as people who "did not wish to engage in socially useful work" (as all good Soviet citizens are supposed to wish to do!). The story went on:

"The case has ended. The criminals have been punished. But we would like to emphasize something that was not mentioned at the trial, namely, the struggle which our public should wage against speculation, a most shameful survival of capitalism. Unfortunately, certain public organizations overlook such cases. . . . The struggle against speculators and their accomplices is the duty not only of the militia (police), the prosecutor's office and the courts, but of our entire population as well."

If the exploits of an individual should happen to make news, the treatment is impersonal. The Soviet press has written a great deal about "Stakhanovism." Though the term has not been in official use for the past year or two, it had been made a household word in Russia, standing for the worker's initiative and resourcefulness in overfulfilling production quotas. It takes its name from one Stakhanov, a miner who accomplished extraordinary feats with a drill. But what is known about Stakhanov himself? Nothing about him except what he did with a drill has ever been considered newsworthy.

Society news, when it is reported, resembles the court circulars of Victorian times. From time to time it is this news that provides the only clue to the status of one or another high ranking official. The first indication of police chief L. P. Beria's fate was given by a "society" announcement. The list of dignitaries at the opening of an opera failed to include his name. It was confirmed later that at the time of the performance he was in custody.

In Aug. 1955, in the early weeks of "the spirit of Geneva"—the phrase of Khrushchev's so widely publicized in Soviet propaganda—so well publicized that most Americans don't even recognize it as a Soviet propaganda slogan—*Pravda* departed from accepted form to report a unique social affair "in the country." Premier Nikolai Bulganin had invited the entire dip-

THE PRESS ROOM OF *Pravda* and other Soviet newspapers and magazines, Moscow

lomatic corps and foreign correspondents to a party. *Pravda* used such extravagant—for it—phrases as "laughter and merriment were heard" and the "mirror-like stillness of a millpond."

The Communist Party line in the press has its hero. It is the "social process," as this is conceived by the Party. One day the featured press article may be the coming election to the Supreme Soviet. Another day it may be the celebration of Miner's Day, and what this implies for the "glorious construction of socialist economy." Industrial production and the need for more of it; problems of agriculture; aspects of Party life, such as indoctrination of citizens and supervision of government institutions—all these are constant themes in the pages of Soviet newspapers.

A typical day's offering in the four pages of *Pravda* looks like this:

Page 1. Unsigned editorial on the status and shortcomings of the building industry. Texts of two government decrees, one instituting the annual observance of "Builder's Day," the other announcing the demobilization of Soviet troops who have served a fixed term of service.

Page 2. Detailed, editorialized reports on (a) a competition between the coal miners of the Karaganda area and the Donets basin to outproduce one another; (b) progress of grain procurement by collective and state farms in various regions of the U.S.S.R. Formal announcement of the visit of a foreign prime minister with retinue.

Page 3. Article by an official of the Ministry of Building Industry about the problems of the industry. (This serves to reinforce the editorial on page 1.) Article by a professor on how best to harvest the current crop of flax. In the column on "Party Life" a letter from a Communist urging better preparation to insure smoother, more productive Party meetings. News briefs (4 or 5 lines each) of domestic events.

Page 4. An editorialized dispatch from Bucharest about cooperation between Rumanian agricultural workers and their Russian counterparts. Article summing up foreign press reaction, and giving official Soviet slant, on the forthcoming negotiations with the foreign dignitary whose arrival was formally announced on page 2. News briefs on foreign affairs (4 or 5 lines each).

Reading a Soviet newspaper from cover to cover is a chore entailing ineffable boredom for a western reader. The Soviet press is by its nature dull—except to those for whom it is a matter of life and death or at least a matter of their political

or economic future, because it is the key to the attitude and line of the Party.

Palgunov claimed that Tass has an incoming daily file that averages 1,677,000 words a day, received from (a) its 40 foreign correspondents, with a total of 200 employees overseas; (b) its exchange services with the Associated Press, the United Press, and other world telegraphic agencies; and (c) its 800 domestic correspondents. He estimates the incoming file of the Associated Press at 1,000,000 words a day, but concedes that the Associated Press, having more correspondents, is better off with its 1,000,000 words. He explains that this is because they are more usable words; that the Associated Press has told its correspondents exactly how many words it wants on each story, or each day, which cuts down the total wordage greatly and improves its quality.

Palgunov says Tass sends out daily to its newspaper clients 40,000 words of domestic material, and 20,000 words of foreign material. A four-page newspaper, which is the typical size in Russia, can print only 16,000 words. Therefore, the editors must select what they want from the 60,000. Palgunov flatly denies there is any direction from Tass as to what the papers should select. He claims that any Russian editor could edit his paper without printing a single word from Tass—if he wished. He quickly admits, of course, that this would prove impracticable because without the Tass service an editor wouldn't have any domestic or international news at all.

Palgunov pushed at me a batch of the previous day's papers. I picked up three of the top four or five. These had exactly the same headline across the left-hand two columns on the first page, and the same size picture of the same event streaming full width across the bottom. I asked if Tass had sent out instructions to handle this story in this manner. Apparently embarrassed, Palgunov vigorously denied that the sameness of headlines and make-up was Tass's doing. He insisted that the identical headlines and pictures were only "coincidental"; that any good editor would give this same play to the story about U Nu, the Burmese premier, which was the big story of the day. He didn't try to explain why the headline position, the headline itself and front page format were exactly the same.

I was puzzled by Palgunov's momentary discomfiture. The standardization and uniformity of the Soviet press is as obvious as it is well known. The three papers I picked off the top of the pile, representative of several hundred throughout the Union on that same day, could not have had that identical treatment by accident. Such a meeting of minds of editors on headline and make-up and picture is manifestly impossible mathematically. If Tass doesn't send out such material with instructions to editors, then the instructions must come from somewhere.

The following day Gubin of *Izvestia* laughed at my account of the three papers with identical headlines and pictures, and said that this was "forced news." He referred to "Tass headlines." But he wouldn't elaborate. He said, "With experience the editors learn how it should be done," and I really believe that this last comment is the key comment on the press as a whole. This is a more important factor than any instructions coming from anywhere. Who indeed wants the responsibility for giving such detailed instructions on any except perhaps the biggest stories, such as U Nu's visit? Thus my over-all impression is that the uniformity of the Soviet press is not achieved by detailed internal censorship or detailed instruction by *Pravda* or by Palgunov or by anyone else. The responsible editors of all papers are hand picked by the Party. They are highly trained in Party matters and discipline, as well as on technical matters. They know how to put out the kind of newspaper the Party wants. They don't have to be instructed in details (except once in a while!).

Gubin insists that, far from having someone over him who must approve his material, he is told by those to whom he is responsible, the Presidium of the Supreme Soviet (not the same body as the Presidium of the Party), "You're the editor; get your editorial board together and make up your mind what position *Izvestia* wants to take."

Gubin presented me with three issues in which he criticized the Ministry of the Meat and Dairy Industry. The minister was so upset that he wrote a long letter. The Collegium of the Industry, according to the letter, had met and agreed with the correctness of the *Izvestia* criticisms. The letter pointed out that there was "incipient reconstruction" of the ministry's work. It thanked *Izvestia* for "yielding much that was useful." This ministry, Gubin said, is now more compact. Costs have been reduced, extra departments have been eliminated.

Gubin sought to imply that his role is similar to that of an American newspaper in criticism of the government; but he did not suggest that he ever criticized the top figures of the Communist Party, or any of the Party's plans or statements.

Izvestia's daily circulation of 1,400,000 is drawn in large part from the 1,500,000 deputies of local soviets, and from the administrative commissions under these soviets. A soviet is described as a legislative body, but it doesn't have too much legislating to do because it takes its orders from the Party. Gubin points out, quite correctly, that his newspaper, being devoted to government, has special importance in the Soviet Union because government itself is most important, embracing as it does the total life of the people—not only their economic life but even their culture.

The circulation of *Pravda*, the Party paper, in Nov. 1955 was 4,900,000, but was to be stepped up about Jan. 1, 1956, to 5,500,000. But it was claimed that *Pravda* could sell 10,000,000 or 12,000,000 copies if it had the needed paper. It flies matrices of its daily issue to regional centres throughout the U.S.S.R. for printing and local distribution.

Pravda is very profitable. Its plant prints 20 magazines in addition to the newspaper. It has 5,000 employees. It owns apartment houses, a sanatorium, a secondary school, a school to train printers and a Palace of Culture. And still there is much profit left for the state budget.

I asked Zhukov, *Pravda's* deputy editor, whether the American editors and people were right in thinking that *Pravda* set the line for the entire Soviet press. He replied that when he worked for *Komsomol Pravda*, that paper had made an effort to set a line so that others would copy it. So, he said, did the labour paper; it also would like to set a "line." And, so he said, would all editors. Thus he was happy that *Pravda* now makes this same effort. In this explanation we have an example of the skill of the Soviet leaders in dialectics: their skill in dodging the direct question and seeking to divert the answer into other channels. Zhukov knew that I knew that the answer to my question was a simple affirmative. Indeed, he confirmed it as he went on, "Some think that top members of the Communist Party read and approve every article in *Pravda*. This is not true. But of course *Pravda* reflects the line of the Party." Zhukov, foreign editor of *Pravda*, as befits his role in setting the line and tone for the treatment of foreign news for the entire U.S.S.R. and satellite press, talked more about politics than about *Pravda*.

The second Geneva conference was in session at the time I spoke to Zhukov, and "contacts between East and West" was one of the questions on its agenda. Some days before, U.S. Secretary of State John Foster Dulles had announced that the United States would abolish the requirement that American passports must be specially validated for travel to the Soviet Union and certain other east European countries. *Pravda* and

other Moscow newspapers were printing editorial articles on the desirability of "more East-West contacts." No word of Secretary Dulles' passport announcement had been allowed to penetrate the news columns of the Soviet press. When I asked Zhukov what was the reason for his paper's total silence about this key item in the world news, his reply was that space was "limited" in the four-page Soviet newspapers!

Zhukov's views on foreign policy, as distinct from journalism, I shall not report except for the key point, which is an example of the propaganda line of Nov. 1955. He said: "One could argue at length as to who is to blame for the loss of trust after the second war. Let us leave that to the historians. The main thing now is not to allow this little flame which has been kindled at Geneva to flicker out.

"The American people are practical. They will understand that the two countries must start where we now are. We now have two sides that are equally strong. If the two sides were not equally strong, there might be some reason for one or the other to make compromises or concessions. But today there is no better starting point than exactly where we are. Indeed there is no other.

"To put it crudely, you of the United States must not go after false Utopias. Don't think that you can make the Bolsheviks retreat. This is impossible."

This was his way of saying that the United States must accept the hard fact of the injustices Communism has worked on unwilling peoples in many parts of the world. If America wants to remedy these injustices, Zhukov intimates, what is she prepared to offer Russia in return?

Frederick Barghoorn of Yale university has called the Communist Party "an ideology in arms." The press is on the Party's front line of ideological artillery. As an easy example of complete Party domination, we may well remember how the entire Soviet press, which had been cannonading against Naziism day in and day out for years, suddenly changed its tone to one of friendship and mutual regard within 24 hours after the Ribbentrop-Molotov pact was signed in 1939.

Some observers minimize the effectiveness of the Soviet press because of its dullness. But I am impressed with the fact that approximately 43,000,000 Soviet citizens buy the dailies, and tens of millions more buy the 7,000 other papers.

I'm impressed by the fact that the press calls the tune to which others march.

I favour continuing the efforts of the Voice of America and the B.B.C. (British Broadcasting Corporation) to bring straight news to the Soviet people, even though only part penetrates the Soviet jamming. I favour bringing top Soviet journalists to the United States to see for themselves what we are like, even though they will be required when they return to be critical of us. I favour formal demands that the position taken by western statesmen be fairly reported. I favour negotiations for the circulation of western newspapers and periodicals within the Soviet Union. I favour consistent pressure on the Russians to cease and desist their costly jamming of our broadcasts. I like Secretary Dulles' idea for an exchange of radio programs on domestic networks.

I am not optimistic that any important improvement in the Soviet press, from the western point of view, will come about except as Communist Party strategy or tactics dictate. Every column, every story, every editorial will continue to promote the Communist Party line, to the complete exclusion of anything that interferes with that line.

This is a major area of the Communist saturation strategy—that everywhere the Soviet citizen looks, and in everything he reads, he finds nothing but the promotion and glorification of the aims of the Party.

PROPAGANDA AND THE ARTS

The Most Diverting and Perhaps the Most Transient of the Soviet Propaganda Assaults

Olga Bergholtz, a Soviet writer on art and literature, recently voiced a criticism that would have been impossible before Stalin's death: "Our Soviet theatre has lost its theatrical qualities . . . Love has disappeared almost completely from our lyrical poetry, just as nude bodies have disappeared from our paintings, and movement has gone out of our movies. There the characters do nothing but sit and stand and talk, and above all take part in meetings."

What Mme. Bergholtz was complaining about, though she couldn't and didn't say it directly, was the Communist concept of "socialist realism." That is the phrase used by Soviet propagandists to prescribe the goal for Soviet artists, novelists, playwrights, musicians and movie makers. With this phrase as their cloak, the politicians convert the creative artists into propagandists. With it they have stultified the great tradition of the arts in Russia.

On Dec. 19, 1955, the United Press sent a dispatch from London stating that "The Communist Party newspaper *Pravda* has complained that Russian music, while full of 'socialist realism,' is dull." The dispatch continued, "Soviet music and musical criticism have resolutely taken up the position of socialist realism, gained in the struggle against formalism, naturalism, aestheticism, cosmopolitanism and against the neglect of classical heritage and manifestations of antipopular bourgeois ideology."

In Leningrad, Moscow and Kiev, in Warsaw, Budapest and Prague, I asked the "cultural officials" what the phrase "socialist realism" meant to them. The words and ideas used to describe it are among the most interesting and diverting I encountered on my visit. Further, they show the dialectical skill of the Russians in defense of attitudes which seem to us preposterous.

"Socialist realism" was established as the basis of all the Soviet arts in a resolution of the Central Committee of the Communist Party in 1932. This decreed "the creation of works of high artistic significance saturated with the heroic struggle of the world proletariat and with the grandeur of the victory of Socialism, and reflecting the great wisdom and heroism of the Communist Party."

When I entered the Soviet Union at Leningrad, my first exposure to "socialist realism" in painting and sculpture came in that city at the art school of the Soviet Academy of Art. I believe I am the first American to visit this school since the 1930s. It is one of the two leading art schools of the U.S.S.R., the other being the Academy's school in Moscow. The dean at the Leningrad school gave me this definition: "Socialist realism is realistic art understandable to the masses of the people." The paintings themselves, in room after room of the school's exhibit of work of present and past students, reminded me of the illustrations that used to appear in the *Saturday Evening Post* and *Collier's* back in the 1920s, except that the themes were different. The technique is what our American artists of those days called "commercial art"—and, I suppose, still do.

In one of the art classes I visited, I turned to the dean in front of three finished oil paintings, which seemed to me to be competently done by commercial standards. They were large paintings, perhaps 24 in. by 40 in. in size, of a woman in bright coloured clothes and with a not unattractive face, and I asked the dean how anyone could determine which of the three was best. All seemed to me to be the same. The dean shrugged his shoulders and said that sometimes it was impossible to deter-

mine the best among works of equal merit. In such cases he assured me that more than one artist is given the prize. But he insisted that there were often differences which I might be unable to detect.

In the rooms of exhibits there were hundreds of paintings by former students including some dating back to the period before 1917. In the post-1917 rooms (the earlier period was represented inconspicuously in the back rooms) were countless scenes of Soviet heroes. There were no boys and girls; no families and no nudes; no attractive or beautiful designs or arrangements of lines and colour; no mirth and no gayety; no impressionism, abstractionism, surrealism or any other kind of ism. I walked through room after room of huge canvasses showing Lenin making orations, usually with a young black-haired determined Stalin sitting next to him; showing farmers resolutely putting their hands to the plow; showing generals grouped together pointing triumphantly at their charts, gesturing onward to a victory that seemed certain; showing Stalin in heroic size and posture.

I commented that the art of Russia, in addition to being "realistic," was certainly grim.

The Leningrad school has five faculties—painting, drawing, sculpturing, architecture and "history and interpretation of art." The most talented child students—about 175 to 200 of them in Leningrad—are selected when they are only 11 years old from the fourth grade of the ten-year educational system. (There must be a high mortality rate, since the dean says the school has only 700 or 800 students.) Others take examinations and enter after the ten-year school, at about 17. These older students take a four-year course, almost wholly vocational, with five hours a day of drawing and painting.

The associate director, who accompanied the dean and me on our tour, assured me, "men like Picasso had to go through years of painting of the kind we teach here before they could develop individuality." This statement later seemed extraordinary to me, as I looked back on it. It implied that there may be something beyond "socialist realism," and something even better. This was the only such implied admission that I received anywhere from any Russian or satellite citizen.

(In Moscow I was told by an American correspondent that Picasso, himself a member of the French Communist Party, had said, "There is no art in Russia; just portraits of generals loaded with medals." In reply to this, Gerasimov, president of the Soviet Academy of Art, and a painter of what I call the "Stalin school," retorted: "We respect Picasso as a fighter for peace; but he's no artist.")

As I left the Leningrad Academy I saw two large blank canvasses, perhaps 10 ft. by 15 ft. in size, lying on the floor at the top of a great staircase. I asked what they were for. The associate director told me that they were for the pictures of Marx and Engels which were to be painted for the coming great holiday, Nov. 7. I raised my eyebrows and asked how long it would take to paint these giant pictures. He said, "Two days. We can of course in an emergency do them in eight or ten hours; they are just copies of photographs."

"Just copies of photographs!" This is one way to judge Soviet art and its slogan, "socialist realism." But it isn't the only way.

I pursued my inquiries in Moscow. Mr. Nazarov, a deputy minister of culture for the entire U.S.S.R., and not only a trained dialectician, as most Soviet officials seem to be, but eloquent as well, as many also are, said to me: "We emphasize the theme of labour in art and literature because everything comes from labour and everything should go to labour."

Nazarov continued, "All Soviet literature and art pursue the most lofty aims of mankind. I do not say this as an agitator, but as a fact. As to freedom, our American critics are misled.

Ask any artist or man of letters here whether he is free. His answer will be 'yes.' He can pick his theme. He can deal with it as he wishes. The issue is how one defines freedom. Socialist realism is not a stereotype. On the contrary, it gives the artist the opportunity to manifest his individuality to the full."

This statement isn't true by our standards. If the artist wants to support himself as an artist, he must paint as he is told to paint. By western standards, Russian paintings can only be called stereotypes. But I do not claim that Nazarov did not believe what he said. He has been trained, for example, to use a tortured definition of the word "free." Such usage is an instance of the Communist propagandists' trick of first appropriating, and then debasing and bastardizing, the great words of western civilization.

Even more eloquent, and more dialectical, was Nicolai Skachko in Kiev, deputy minister of culture for the Ukrainian Soviet Socialist Republic. To my question, as to whether politicians set the standards for artists in their efforts to convert all artists into propagandists, he replied, "There is no particular author for our standards. They are the work of the collective. The philosophical basis for them is of course in Marx. Lenin and Stalin were the people who worked out Marx's philosophy applied to the arts. To understand socialist realism you must understand dialectical materialism. Materialism has a great and long history, and dialectical materialism is even more complex."

Skachko went on, "The method of socialist realism gives the artist an opportunity to project the developing world; it is the method by which the artist portrays the objective world around him, the world that exists independently of the artist's will, the world that is everybody's world." This explanation was delivered with emphasis because the deputy minister could see that I wasn't in agreement. He kept giving new definitions and examples. It almost seemed that he couldn't imagine that he could fail to persuade me. He was himself an example of how deeply imbedded runs the Communist indoctrination, even in men of high intelligence and training. Indeed, this is perhaps the most marked among the most highly placed. The minister continued, "Things are constantly dying out and are being born. The artist must stress the latter, what is being born, rather than what is dying. The artist is an active participant in our life, and by his works he takes part in the new life."

All this must sound pretty reasonable, even appealing, to large numbers of Soviet artists who have never heard anything else. I'm sure that many of them can't even imagine anything else. And of course all this brings them to heel as tools of the propaganda apparatus of the Soviet State.

Skachko continued by explaining that "socialist realism" was more than just duplicating photography. It must portray an image, he said. Thus when an artist paints a woman *kolkhoz* (collective farm) worker, he must "catch the image"; he must "project the depths of her soul." The minister waxed enthusiastic. "In her eyes," he said, "I see a woman—more than a woman, I see a mother—I even see more than a mother—I see that someone loves her. And beyond all this I see that she is performing an heroic deed in her work at the *kolkhoz*. This image is realism; the rest is photography." What the government is after in this case, of course, is motherhood and high productivity for the *kolkhoz*. Towards these ends, they prostitute the artists.

To my question, "Should the artist paint the weak side of life?" the minister replied affirmatively. But he explained that the weakness should be painted only so that it can be eliminated. He told me of a painting called "Discussion of the Two." In the Soviet schools, the marks used in grading the pupils' work run 5, 4, 3, 2, 1—and 2 is "unsatisfactory." The minister said, "Here you see young people condemning—by

Benton Reports

their postures—the behaviour of a comrade who got a 2.” Here in this painting, he said, is “socialist realism.” And so it is. The Soviet government in this case is using the artist to shame and cajole students to greater effort for the greater glory of the fatherland.

“Is the artist in the Ukraine free to paint what he wants, and as he sees it?” I asked. “His theme is wholly up to him,” said Skachko. “It is his personal affair, with no restrictions.” Then came the big qualification, and in this qualification unhappily flows the artist’s lifeblood, his chance for a livelihood. Skachko hurried on, “The Ministry of Culture does turn to the artist to persuade him to accept certain themes.” Skachko was speaking the next day at an artist’s meeting. He was going to recommend to them as a theme the new Kakhovka power station. He wanted the artists to go there and work out compositions “to show the images of the people who created the power station—so that a person looking at the picture can read the whole story of this great achievement by looking at these people.” Here in this illustration, we see how, under Communist dogma, “socialist realism” fosters and furthers the aims of the state.

There are about 1,000 artists in the Ukrainian S.S.R., said Skachko. I assume that a high percentage must be employed in the propaganda bureaus, in industry and other places where the themes are obligatory if the salary is to keep coming through. But even with other artists, their pictures seemingly cannot be exhibited or shown if they fail to fit into the definition of “socialist realism,” or even if they stray too far from the approved themes.

Thus Skachko is listened to most intently by those Ukrainian artists who want their daily bread.

There have been two periods since the Revolution when artists and writers were under most intensive pressure to conform. These were in the mid-1930s and in the years immediately following World War II. The pressure now seems to be easing slightly, since Stalin’s death.

One hopeful sign is that the paintings of the French Impressionists, which for years have not been displayed by the Hermitage in Leningrad, were shipped to Moscow for a show in Nov. 1955. Another is the report of Henry Shapiro on the Moscow annual art show for Soviet artists. Shapiro has covered Moscow for 17 years for the United Press. He tells me that, up until 1952, more than 50% of all pictures exhibited showed Stalin either as the only figure or in conjunction with Lenin or in some other favourable situation. The “Stalin school” still predominates, but the paintings of the Marshal himself are no longer in evidence. Further, Shapiro believes that many Soviet artists have painted things in recent years for their own enjoyment and pleasure, well knowing that they could not show them or sell them. He thinks that such paintings, now hidden away, may begin to make their appearance over the next few years.

Perhaps an even more hopeful sign is that Gerasimov (not only head of the Academy, but the brother-in-law of Presidium President Klementiy Voroshilov), whose paintings always featured Stalin, admitted recently to Shapiro that he was painting some peasant women taking a bath. This indeed sounds like the Revolution—in Soviet art.

In the satellites, “socialist realism” receives obeisance but apparently hasn’t yet become the sole lodestar of the arts. However, in Prague, Mr. Stoll, Minister of Culture of the Czechoslovakian government, described “socialist realism” in literature as “in fact a continuation of the great traditions of literature basing itself on Shakespeare, Cervantes, Tolstoy, Mark Twain and Walt Whitman. Socialist realism isn’t meant to restrict a writer’s style. However, each writer must realize

LOUD-SPEAKER mounted on a telephone pole broadcasts news and propaganda to workers in the fields

a harmony; the personalities of the writers must not clash with the interests of society.”

In Budapest, Mr. Ibos, of the Hungarian Ministry of Culture, who is responsible for 56 permanent theatrical companies—plus the circus!—said that “socialist realism” is “by Gorki from Marx and Engels out of Lenin.” But only about one-third of the plays he produces qualify as “socialist realism,” the remainder being the classics or “critical realism.” The last group are “modern” plays written before “socialist realism” was ever heard of.

The director of the motion picture division of the same ministry in Budapest, Mr. Uzhely, paid his respects to “socialist realism” as depicting “real life, including people at work.” He said, “You cannot say that Marxism-Leninism isn’t in our life, because it is.” He added, “If we show in the life of our people only love, and don’t deal with administrative problems, we are going to make an unrealistic film. But if we show only the people’s interest in production—with no love, no family—that too will be unrealistic. If we show everybody satisfied, everybody agreeing with the government, that likewise would be unrealistic.”

When I pressed for an example of a film of criticism, he cited a film he had recently made, *The Ninth Room in the Hospital*, which “shows that the care of the sick often is not good.”

All of the foregoing quotations from leading practitioners of “socialist realism” in the arts help to show how Communist dogma suffuses every activity of life, and how it is used as

an all-powerful yardstick to whip the unwilling or uncertain into line, and to marshal every recourse of society for the glorification of the goals of the state.

Harnessing the Writers

Writers are of special concern to the Communist Party, not only because of the influence of their plays and novels and essays, but because the Party is dependent on them for the words and phrases which are the bullets of the propaganda machine gun. And they pose very special problems to the Party. The task of harnessing creative imagination to the purposes of political propaganda is not simple, for great writing usually requires full freedom of expression for the writer. In Communist Russia's upside-down world of the arts, the Party and not the writer orchestrates the emotion and decides what is right and wrong, and even what is ugly and beautiful.

Under the Czars the function of writers as critics of society acquired high significance. Political activity as such was prohibited, and thus literature became the best means of protest against autocracy. Satirists such as Gogol and pamphleteers like Kropotkin contributed to the revolutionary ferment. The Communists are not unmindful of this tradition. They themselves most benefited from it. Thus they now take extraordinary pains to try to enlist the loyalties of writers, and to stifle even the slightest manifestation of any trend critical of the regime.

For the writer, "socialist realism" has at least two major stable elements. The first is the Party dialectic. This demands a "true and historically concrete expression of reality in its revolutionary development." Of course the only truth it recognizes is that of "people struggling for socialism." Everything that favours the development of "socialism," as it is conceived by the Communist Party, is true and must be glorified. Everything that opposes it must be slandered and combatted.

The second important and stable element is optimism. "Socialist realism" cannot admit possible failure in the achievement of socialist aims. It must focus on a "happy end," on the final victory of socialism. The exploits and sacrifices of the heroes of Soviet literature must not be treated as ends in themselves. The cause of socialism is always the end. Reverses and shortcomings can never be more than temporary. They can never be attributed to defects in the system itself. They are always caused by alien, by enemy, machinations. In the end socialist righteousness must triumph.

This bundle of self-righteous precepts can and has led to absurd, even grotesque, presentations of life. In the years following World War II many writers unwittingly fell into the trap of portraying their villains more realistically than their heroes. Their villains were human beings, with a normal dose of failures and weaknesses. Their heroes were artificial creatures who resembled no one the reader could recognize. And this villain-hero reversal of course netted many writers sharp rebukes from the Party.

The talented poet, Anne Akhmatova, was personally denounced in 1946 by A. A. Zhdanov, a member of the Politburo, in the following language:

"Our literature is not a private matter calculated to please various tastes on the literary market. We do not have to make room in our literature for tastes and preferences which have nothing in common with the morality and the virtues of the Soviet people. . . . Her [Mme. Akhmatova's] writings may only plant the seeds of sadness, demoralization, pessimism, the desire to flee away from the real problems of social life, and of isolation from the social life and activities for the sake of the narrow world of personal experiences."

Under the pounding of criticism and denunciation many writers sought ways of escape. Some ceased producing alto-

gether. Others, such as Akhmatova and Pasternak, found refuge in translating foreign works. Still others fled into the past, into historical themes that seemed safe to handle.

Most writers seem to have tried their best to cater to the demands of the Party. The Soviet playwright Nicolai Vinta invented the "no-conflict theory" which was well in accord with Stalinist ideology. It was based on the assumption that, since Communism has eliminated basic conflicts from Soviet life, and since Soviet drama is supposed to represent life as it is, drama itself should therefore be "conflictless." The only thing wrong with this assumption is that it flouts reality and produces dull plays.

Current topics are the touchiest for the writer. The Party may unexpectedly frown on his treatment and denounce him for "kow-towing before the West," or for "bourgeois nationalism" or any of several other "isms." Some works which were rewarded with prizes have later been found wanting and have had to be revised. Alexander Fadeyev, one of the important names in Soviet literature, had to refurbish his Stalin prize-winning novel, *The Young Guard*, only two years after it was published. Fadeyev's fault was that he had portrayed the heroic resistance to the Nazi invaders by a *Komsomol* unit without emphasizing that the feat was accomplished under the guidance of the Party.

When authors seek safety by treating their subjects as inoffensively as possible they frequently incur charges of "formalism." To be accused of formalism, however, is infinitely better than to be found guilty of the dread crime of "bourgeois cosmopolitanism." The punishment for the latter is usually expulsion from the Union of Soviet Writers. Expulsion means loss of livelihood, and manual or menial work if the writer wants to eat.

After Stalin's death Soviet writers began to experiment cautiously. Vera Panova, a former Stalin prize winner, and Ilya Ehrenburg, best known in the west among current Soviet writers, came out with novels, *The Seasons of the Year* and *The Thaw*. These exposed some of the seamier side of Soviet life. Both books discuss graft and petty thievery, crookedness and double dealing on the part of Soviet officials. They do not conceal other human weaknesses such as dissimulation, drunkenness and jealousy. They describe the longings of people for a better life, for more comfort and for safety from the secret police. Ehrenburg even had his lovers talking about love, instead of about "higher productivity for the glory of the motherland."

Both Ehrenburg and Panova were reprimanded for "exaggerating" and for an "impermissible exercise of personal arbitrariness," but they did not lose their membership in the Union of Writers.

The writer's need for at least some freedom, if only to make good propaganda outside the U.S.S.R., has apparently now been recognized in the U.S.S.R. However, Soviet literature clearly remains the handmaiden and vassal of the Party.

In Moscow I lunched with Konstantin Simonov, one of the half-dozen leading writers of Russia, a poet, playwright and novelist. Simonov had denounced Ehrenburg's book. I asked Simonov if in his new play, "A Love Affair," the lovers talk about the need for higher levels of productivity. He replied, "Well, people do talk about the need for more production."

For their subservience to "State purposes," Soviet writers like Simonov are well rewarded in money and in prestige. They receive generous royalties; and those whose works sell best are authentic "millionaires," with cars and chauffeurs, town apartments, country homes in the suburbs and *dachas* in the sunny Crimea. They are like the commercial writers in the United States. They give the client what he wants, and are very well paid for it. In the United States, the client may be CBS, Gen-

eral Motors, the *Saturday Evening Post* or MGM. In Russia, it is only the Party. And the Party seeks only propaganda, for its own ends and for those of the Soviet State.

How Culture Is Organized

Astride the entire area of the arts, including the popular arts, rides the Ministry of Culture. This is an all-powerful body in its domains. Its functions are difficult for an American to comprehend. Mr. Nazarov sketched out for me the areas covered by his ministry: (1) the creation and production of films; (2) theatres and music; (3) representative or pictorial art; (4) radio and TV; (5) publishing houses, exclusive of newspapers (not all publishing houses are under the Ministry of Culture, but the ministry coordinates all); (6) the printing trades; (7) books, including the operation of book stores; and (8) cultural enlightenment.

Each of these eight divisions is manifestly a gigantic enterprise. I was particularly impressed by the scope of number eight, which is perhaps comparable with everything that happens in what some people in the United States like to call the field of "adult education." Under cultural enlightenment come the libraries, and Nazarov claimed 400,000 of them; the cultural clubs or centres, of which there are scores of thousands; the museums; the village reading houses; and the palaces of culture. These last are the large new and fancy buildings that dot the Soviet landscape and in which the cultural activities of the communities centre.

Skachko, whose Ministry of Culture in Kiev covers the Ukrainian Soviet Socialist Republic, with its 42,000,000 population, and which reports up to the Ministry in Moscow, outlined a somewhat similar scheme of organization. Its theatrical division, for example, operates 74 theatres. There were only seven under the Czar, Skachko claims. The control of the theatres, of course, brings the ministry into close touch with the Union of Writers. How can the writers do their work for the theatre, Skachko wanted to know, unless they know what will be produced? His version of the Moscow ministry's "cultural enlightenment" included the supervision of "35,000 libraries containing 111,000,000 books which serve 5,000,000 regular readers; and 70,000 amateur 'circles' for painting, drama, ballet and music, with 1,000,000 members."

* * * * *

The chief glory of the Soviet Union in the field of the arts remains the ballet, the opera and other forms of music, and the classical theatre. These are the arts which have proved least susceptible to "socialist realism." The contemporary theatre is as blighted in its writing as the contemporary novel; but Shakespeare and other great Western drama is widely popular, along with many of the Russian classics. Simonov told me there are about 550 to 570 full-time theatrical companies playing throughout the U.S.S.R. This is on a scale which must far exceed, several times over, that of all the nations of the West put together.

As was shown by the United Press dispatch quoted at the beginning of this section, attempts have been made to convert Soviet music to "socialist realism." For example, composers have been urged to weave folk melodies into their settings. But Soviet music, its composers, opera companies, orchestras and soloists, still remain outstanding by Western standards. As for the ballet, that is purely classical, and in a tradition going back almost two centuries. I visited not only the ballet in Leningrad, but also the great ballet school maintained by the Bolshoi theatre in Moscow. Everywhere in the U.S.S.R. the ballet is superb. There are 30 great companies and 11 full-time schools which take the most talented children at age

10 and turn them out as ballet performers at age 19. But even the Moscow ballet school has its propaganda task. Students come from all 16 of the Soviet republics to be trained in folk dancing. They also come from the "People's democracies." And, of course, the ballet is sent outside Russia, even last year to Paris. The Soviet propagandists seek to make the ballet a symbol of the glory of the Soviet arts.

* * * * *

Sir John Maynard, a not unfriendly historian of Russia, has written, in his *Russia in Flux*:

"The terrifying efficiency of organized propaganda, eliminating truth by calculated suppression and misrepresentation, and dinning the prescribed formulas into the ears of millions prepared for their reception by universal education, is ominous of a more complete regimentation than any merely negative censorship. The Czars only played with control of thought: their worthy and somewhat somnolent (not to say thick-headed) censors passed the most transparently subversive suggestions. The greatest innovation of the Bolsheviks in the 'bear's corner' of old Russia is an efficient administration. Their orders go right through to the bottom. They have harnessed the writers and artists themselves to their censorship: they have secured an effective monopoly of truth, and filled the market with their own brand of the article, and the smuggler of the precious commodity has little chance of competition with merchants in whom all powers are concentrated."

SOVIET MOVIES, RADIO AND TELEVISION

In these areas as in all other fields of communication, every technique centres on teaching and instructing the public, or at least on conditioning it, according to the lights of the Communist Party.

The function of providing entertainment or diversion, dominant in American movies, is only a secondary motive in Russian movies. In radio and television, the Russian and American systems grow closer together. In the United States, the entertainment is used to attract the audience so that the advertiser can project his sales story; the Soviets use the entertainment to develop an audience for their political propaganda. In the U.S.S.R., the political indoctrination of radio and TV becomes the "commercial."

In all three fields, there is a limit beyond which the Russians cannot go with their propaganda.

A communication system devoted largely to propaganda or to instruction needs a monopoly position and a captive audience. The Russian newspapers are a good example. The audience for newspapers can be made captive only if there is no other way of satisfying the thirst for news—or if subscription is compulsory. This is the situation in the U.S.S.R. American editors must compete to catch and hold the readers' interest; the Soviet editors need not.

However, the Soviets must limit or trim the dosage of propaganda when the audience can't easily be made captive. This is true in the arts such as the theatre and ballet. It is also true of some of the mass media. A theatregoer can attend the ballet rather than a propaganda play. Or he can stay home or go to the park. The same is true of a movie-goer. The radio listener or TV viewer can turn off the set.

Yet the Communists constantly strive for greater and greater propaganda impact through radio, TV and the movies, even at the risk of cutting down on the appeal of the product to the point where it may lose a part of its audience or its effectiveness. The Communist Party once noted that new plays being developed for the Soviet stage under the guidance of the min-

Benton Reports

istries of culture were submitted for examination to "the local art boards, the Republican Committees on Arts, the Chief Repertoire Board, the Central Theatre Department of the Committee on Arts, the Art Council of that committee, to theatre directors, editors of periodicals and officials of publishing houses." This process will insure simon-pure Communist plays; it will also guarantee in most cases plays that are uninspired and dull.

Motion pictures, likewise produced under the ministries of culture, suffer not only from the rigid formula of "socialist realism" but also from the cumbersome machinery which emerges from the foregoing example. Orthodoxy is purchased at a high price, in terms of both boring films and long delays. For the next two years the Ministry of Culture has prescribed a quota of more than 200 original feature films. Based on past records, it is doubtful that half that number will actually be produced.

The topics chosen for filming are keyed to the over-all political purposes of the Party. A representative post-war film, produced in 1948 while the anti-American campaign was in full swing, was called *Court of Honor*. This depicts the trial by their fellow scientists of two Soviet medical researchers who have invented a new anaesthetic. One of the pair, Losev, is accused of disclosing his discovery to American scientists at a world medical congress in the U.S. Losev tries to explain, "We cannot isolate our Russian science from the world! People are sick everywhere. States have borders, but science has none." But Losev is accused by the Party secretary in the medical institute of "helping those who want to drag humanity into the inferno of a new war . . . From whom did you want recognition? From foreign shopkeepers, moneylenders, hired murderers?" Losev is unmasked as a "traitor" and punished.

Many forthcoming films will deal with the changes brought about by the Soviet domination over the peoples living in Asiatic Russia and in the former borderlands of Czarist Russia. The post-Stalin regime has pushed the economic development of these areas vigorously. Khrushchev himself has been the foremost exponent of cultivating the virgin lands and grazing areas of central Asia.

One motion picture of this venture, *The Daughter of the Steppe*, has already been produced. This is the story of a peasant girl who leaves her home in a desolate region of central Asia to study in Moscow. Returning to her home as a doctor of medicine (a nice achievement in itself) she finds it completely transfigured. The government's decision to till previously fallow land has caused the area to bustle with the activity of happy and purposeful people engaged in "glorious socialist construction."

The subject matter of Communist motion pictures also came into my conversation later in Prague with the chief of the film division of the Ministry of Culture of Czechoslovakia, a Mr. Hoffman. When I asked what kind of entertainment films he was making and planned to make, he said that emphasis in the next year would be on "films dealing with Czechoslovakia's great heroes and artists, with special stress on the greatest period of Czech history." I asked him what this period might be and, manifestly surprised that I felt it necessary to ask, he replied, "The period of the Hussite movement, of course." (John Huss, Bohemian religious reformer, was burned at the stake for heresy after his conviction by an ecclesiastical commission in 1415.)

The first of three films in a trilogy on the Hussite movement, *John Huss*, has already been released. When I asked Hoffman to describe for me how this film and the second of the trilogy, *Battle of God*, now in production, would differ from films on the subject which might have been made in 1938 or even as late as 1947 before the Communist coup in Czechoslovakia, he replied: "This is a very simple matter. This is a question of ideology. In 1938 our films were made from the capitalists' point

of view. After 1948, all films have been made from the workers' point of view. We stress the progressive role in Czech history of the people. We show that the people have played the biggest part in the development of this history. In our films the people become the heroes, not the emperors and kings. The great developments of Czech history have stemmed from those that have been ruled rather than from the rulers."

The only motion picture theatre I was able to attend in the U.S.S.R. was an open-air movie (not a drive-in!) in Kiev, when the temperature was about 40° F. More interesting to me than the feature was the newsreel. By our standards, it was largely party and government propaganda. It included shots of a mayor's conference in Trieste, featuring the mayor of Moscow; a travelling Soviet dance group in Paris; the arrival in Moscow of two New Zealand officials; the arrival of a British naval fleet in Leningrad, and the departure of a Soviet fleet for a return courtesy call in England; the opening of a new coal mine; a new tractor capable of operating in swampy terrain; and a style show in Moscow, including styles for 6- and 7-year-old children. I was told that the inclusion of footage filmed abroad is new since 1953.

I could not get any figures on the number of foreign films shown in the U.S.S.R., or on the attendance at Soviet movie theatres. With adaptations in the sound tracks of imports from the 15 other Soviet Socialist Republics, as well as from the "People's democracies," there are perhaps in excess of 200 new feature films available annually in the U.S.S.R. and the satellites. Mr. Uzhely of Hungary told me he had imported eight Chinese films since the war; also many films from West Europe of which the Italian films were most numerous because they were "most realistic." My interview with Uzhely persuaded me that few American films would be shown in Russia even if Hollywood offered them to the Iron Curtain countries for nothing. The U.S. films do not conform to the standards of "socialist realism."

Educational and Classroom Films

Bureaucracy and the propaganda strait jacket have blighted the Soviet production of "entertainment" films. But the same cannot be said of either the production or use of Soviet films for education.

As Chairman of the Board of Directors of Encyclopædia Britannica Films Inc., which has pioneered in the production of classroom films in the United States, and which is by far the free world's largest producer of such films, I was particularly interested in Soviet activity in this field. In the U.S. growth has been very slow. More than a quarter century of patient work has gone into demonstrating the value of this new tool for education. Bit by bit individual teachers, school administrators and school boards must be won over. By contrast, in the U.S.S.R. with its system of decrees from the top down, development in this field, once begun, has been most rapid. We in the U.S. are still ahead in the technique of making classroom films (the Russian films are like our "documentaries," and are not closely integrated into the curriculum). But the Russians seem to be forging rapidly ahead of us in the classroom use of films and in the production of films in quantity.

Mr. Kairov, Minister of Education, told me "the use of the film is of tremendous importance." He has the authority and he can demand action. In 1953, he told me, there had been a government decree under which "our Ministry of Education is called upon to develop mobile apparatus and films for the schools; and the Ministry of Culture which makes the films for the theatres must make films for us in accordance with our requests and directions." Kairov added that the use of films in education is only "at the beginning."

But the present activity in this field in the U.S.S.R., so far as I was able to observe it, looks like far more than a "beginning" when contrasted to where we are in the U.S. and when we recall how long it has taken us to get there. I had a chance to study the 1954 catalogue of films for educational purposes put out by the Ministry of Culture in Moscow. It ran 206 pages and listed 937 titles grouped around the following areas of knowledge: natural sciences, agriculture, technology and construction, medicine, preventive medicine, physical culture and sports, culture and art, and fire fighting and traffic regulations. As specific examples, under the section on astronomy there were films on the universe, on thunder and lightning, solar and lunar eclipses, the rainbow, the changing of the seasons, and on the sun. Under physics, there were titles such as *A Drop of Water*, *In the World of Crystals*, *In the Laboratory of the Sun*, *Rays of the Spectrum*, *Marked Atoms*, and so on.

Many of these 937 films were produced primarily as educational shorts to accompany feature films in theatres, but are offered also for use on TV or other nontheatrical use, including that in the schools. However, many films primarily for classrooms are produced by the ministries of culture, and 10 of the 33 Soviet universities make and exchange motion pictures.

In Kiev, at the Film Studio of the Ministry of Culture, I saw two films which were made for school use. One was a good straightforward picture about the coke industry (very important in the Ukrainian S.S.R.). The other was titled *The Story of the Note Book*. It opened with a fourth- or fifth-grade teacher holding up her pupils' notebooks and admonishing her class on their care. Some of the notebooks had smudges on them, some had fingerprints and some had sloppy writing. She told her pupils that she wanted them to appreciate the large amount of work that went into producing a notebook, so that they would have better respect for their notebooks. The film faded into a still photograph in her classroom. This was of lumbermen felling great pine trees. Suddenly the photograph began to move, and the movie went into a very creditable pictorial dramatization of the making of paper from the pine tree right through to the notebook, with the teacher's voice narrating throughout. At the end, back in the classroom, the pupils were standing up and swearing that henceforward they would treat their notebooks with deserved respect. This was a creditable classroom picture by our standards.

In the Ukrainian S.S.R. the schools are served by mobile units with projectors. Some schools have special projection rooms. The goal of a projector-in-every-classroom has not yet been achieved in the U.S.S.R., but at the present rates of progress the Soviets will achieve this goal decades before the U.S. gets one in every four classrooms. I accidentally discovered that the University of Moscow has a professorship on the science of making motion pictures; there is no such chair in the U.S. to my knowledge.

Better to understand the significance of the foregoing paragraph, a reader must cover the opening two sections of this article, and also the final section. If the Soviet Union is going to surge ahead of the U.S. in the adoption and mastery of the modern techniques of education, this can promise an ever-widening gap in their favour in the training of the skilled manpower which will inevitably play a major role in the world of the future.

The adoption by the schools of the United States of modern teaching aids and techniques, in which they are now so backward, is no longer a mere matter of local concern for our towns and cities. Such adoption is critical to the competitive struggle with the Russians which now faces us whether we like it or not—and which promises to deepen and intensify in the years ahead, with ever greater and greater stakes involved.

Broadcasting

Broadcasting within the Soviet Union, both radio and television, is far less thoroughly exploited for propaganda purposes than we Americans might suppose, in view of our own experience with its potentialities in advertising and politics. The Russians know that if they push too hard, the people will turn off the sets. Thus radio and TV are used chiefly for music and the other arts.

In Moscow, I talked with Mr. Andreev, deputy in charge of radio and television; and with Mr. Zimin and Mr. Jouravlev, both of whom, although in the Ministry of Foreign Trade, are involved with the exporting, importing and production of motion pictures and thus with TV. In Kiev, Mr. Skachko, Deputy Minister of Culture, had enlightened me about broadcasting in the Ukrainian S.S.R. The statements below are drawn largely from these interviews. I believe them to be reasonably accurate, but I have no way of double checking.

There were 10,000,000 radio receiving sets in the U.S.S.R. in 1953 (compared with 110,000,000 in the U.S.). In addition there were 30,000,000 loud-speakers in meeting places, on the streets, etc., wired to community antennas. One is exposed to these everywhere.

The Moscow radio offers three programs, on three different stations, totalling 48 hours a day, with one of the programs always available throughout the 24 hours. Music and drama constitute 80% of the total program output (more than 50% is "fine music"). The other 20% is "oral." The oral includes news, international affairs, sports, popular science, agriculture, talks by people prominent in industry and the arts, and children's programs.

There are popular-type lectures on economics and Marxism for adults. There is no politics on programs for children under ten "because they wouldn't listen," but for older youngsters "we try to give them an idea of what is happening in the world—and one lecture a week is to help them understand Marxism as taught them in the schools."

Television stations are operating in Moscow, Kiev, Riga, Tallin, Kharkov, Sverdlovsk, Nalchik, Krasnodov, Omsk, Tomsk, and Vladivostok. These now operate separately and independently "but extensive work is under way to develop a relay system." By 1958 it is planned to have 51 TV stations in operation, tied into a network. Moscow is to have three stations, one using colour.

At present 1,000,000 receivers are in use (mostly 12-in., I gather, from seeing those on sale in stores), exclusive of those in factories and public places. Six to seven million receivers are planned by 1958. (There were 33,500,000 TV receivers in the U.S. in 1955 but only about 7,000,000 to 10,000,000 outside the U.S.)

Stations are programmed from 7:10 P.M. until 12:30 A.M. weekdays, 6:00 P.M. to midnight Saturdays, and Sundays from 2:00 P.M. until 11:30 P.M.

The bulk of TV programming consists of two types: first, the major dramatic productions, both live and on film, as well as operatic and ballet performances, all live, many running 2½ or 3 hours or even longer; and second, films, both feature and educational, with the feature films running about 90 min. each. These latter are available to TV six to eight days after they are released to theatres; the 30-min. educational films are available simultaneously or even before. Newsreels are made especially for TV, and there are some "exchanges" with other countries. These exchanges seem to include purchases from a company in the U.S. called Tele-News. Mr. Andreev said, "Your American company Tele-News covered the Soviet farmers' visit to the United States very well indeed and from their material we produced three programs."

Skachko claimed that by 1960 the Ukrainian S.S.R. would enjoy television coverage of more than 90% of all homes. He said that this would be better coverage than any in Europe. This prediction may show the TV trend throughout the U.S.S.R., and I believe it does. Because the Russians understand propaganda and believe in it, after the full potency of TV has been given an experimental demonstration, they will move rapidly ahead to expand TV coverage. They will seek better to learn how to exploit TV for the benefit of the Party and State. (This will also apply outside the U.S.S.R., as has been true with radio. In Helsinki I learned of a Russian TV station, just over the border, broadcasting Finnish programs. There are no TV stations within Finland, but TV sets are being bootlegged.)

Right now, there is a great shortage of sets throughout areas covered by TV. A set costs about a month's pay, but the pay is low. Actually the cost of the set is low in roubles if judged by U.S. dollar prices. Costs will stay low, as with newspapers, because the Soviet government gladly sacrifices revenue in return for propaganda, and TV sets are likely to remain in short supply for years. Why should they not, when they give to the Soviet buyer such easy access to the great world of the theatre, ballet, opera and first-run movies? With such a bill of fare, for a nation starved for entertainment and escapism, the political indoctrination via broadcasting may be as easy for most of the Russian people to take as our commercials have proved to be easy-to-take—for our people in the U.S.

* * * * *

There is little sign that Soviet leaders propose to relax their monopoly of the movies, radio or TV within the areas they control. Just as they give little indication that they want American movies, so they shrug their shoulders when asked about Soviet jamming of Western radio broadcasts. One top official replied to my query, "that is a political question." Others refused to discuss the 1,000 jammers which are now operating and which seem increasingly effective in obliterating American and British broadcasts, and in shielding the Russian citizens from exposure to anything except the orchestration of the Soviet propagandists.

SOME OBSERVATIONS ON SOVIETIZING THE SATELLITES

Thirty-eight years after the 1917 October Revolution the Soviet Union presents to the West the picture of a full-blown psychological mass disaster. In the satellite countries I visited—the "People's Democracies" of Poland, Hungary and Czechoslovakia—the seeds of disaster have been planted and are now being fertilized and cultivated.

My stays were too brief for much first-hand analysis. Many of my impressions and opinions came from men who impressed me as being competent and knowledgeable and who live in these countries as diplomats from the West—some of them for years and even decades—and whose job it is to understand and report on what's going on. I also interviewed many native-born Poles, Hungarians and Czechs who are Communist officials.

There are major differences between the Soviet Union on the one hand, and these three satellites on the other; there are also very great differences among the three satellites. What they have in common, in the field of communications, is the absolute monopoly power of the Communist Party. Because of this, it is my unhappy judgment that, unless its power is broken, the Party's psychological success in the Soviet Union bodes ill for the satellites during the decades ahead.

At a first casual inspection, the Party's propaganda successes in East Europe do not seem too striking. In Poland and

Hungary the Communist control of communications goes back only a little more than a decade, and in Czechoslovakia only eight years. Some observers will tell a visitor that the Communist indoctrination and propaganda have thus far largely failed. Western observers stationed in Prague agree that, in Czechoslovakia, perhaps no more than half of the 35% who voted Communist in the last free election, just before the Communist coup of 1948, would so vote in a free election today. In Hungary the estimate is that the Communists could get no more than between 5% and 10% of a free vote, with possibly only 1% in the rural areas.

Here are five basic differences between the U.S.S.R. and the satellites which must be borne in mind in judging the present progress of the Communist program of indoctrination:

(1) Because Communists have been in control of the satellites for a decade or less, or one-fourth as long as they have controlled Russia, the first generation is still dominant. This is the generation among whom it is most difficult to win converts.

(2) Since the Communists are in power as conquerors, they have less success when they attempt to appeal to the emotion of patriotism. This was the emotion so successfully played upon by the Soviet leaders within Russia during World War II. Because within the satellites the revolutionary formula is imported rather than native, it does not easily or quickly command the same fervour.

(3) The cultures of Poland, Hungary and Czechoslovakia have for centuries been oriented toward the West, with emphasis on the standards and achievements of the West, and mixed with contempt—beyond any warranted—for Russia. These countries still remain closer to the West than to the East, both emotionally and physically. Reorientation toward Russia is difficult and will take time.

(4) Because of the great waves of emigration in the first quarter of this century, millions of families in East Europe have relatives living in the West. Furthermore, the satellite people are more accessible to the West. They have more radios than the Russians, and more success in listening despite some jamming.

(5) The great majority of east Europeans share religious ties with the West. (And many observers I talked with, including one Communist official, said that church attendance today is higher than before the war; this is most certainly so in Poland, where I learned that the people kneel in front of the crowded churches during Sunday services.) Poland in the last pre-Communist survey was 99% Roman Catholic. Czechoslovakia was 65% Roman Catholic and 30% Protestant. Hungary was 63% Roman Catholic and 32% Protestant. Thus in all three countries church and home can combine to try to offset the orientation young people receive through the schools and the public media of communication.

The new Communist regimes, under the spur of the Kremlin, are thus confronted with stupendous psychological hurdles, far more difficult than their masters face in Moscow. Their progress must be judged against the enormity of the task. Since they consolidated their political power after the war, they have waged their own type of unrelenting war against old values and traditional attitudes. They have attacked the citadel of the mind with unabating vigour. They have attempted to carry out nothing less than a massive spiritual and psychological revolution.

Even to a hurried visitor, the surface manifestations of this campaign of "re-education" are everywhere in evidence. New buildings—for example, the great towering Palace of Culture in Warsaw, "the gift of the Russian people to the Polish people"—reflect the architectural style in vogue in Russia. Theatre marquees once ablaze with English, French and German titles now display native or Russian titles. Bookstores, once famous for

their variety of foreign books in French, German and English, are now replete with Russian Marxist-approved classics. The make-up of local newspapers bears the unmistakable imprint of their Soviet model.

But the revolution wrought by the Communists cuts even deeper. Every satellite institution concerned with ideas, from academies of science to the teaching of poster design, has been reorganized. The administrative machinery of broadcasting and motion pictures, the editorial offices of newspapers, the administration and operation of the opera, ballet and theatre, all were thoroughly overhauled to bring them in line with currently prevailing Soviet models. Further, just as in the U.S.S.R., vast ministries of culture have been developed to promote Communism on every cultural and communications front.

In the Soviet Union the attack on religion had opened with a frontal assault against religion as such. In the satellites the opening moves were aimed at subordinating organized religious bodies to the will of Party and State. Instead of seeking to abolish religion, the Communists have dreamt of infiltrating religious institutions and thus corrupting them into tools of the State. In recent years such infiltration seems to have succeeded in Russia with the remnants of the Russian Orthodox Church.

The relative restraint in religion with the subject people of the satellites, dictated in part by fear of costly resistance, has not been duplicated in other fields. Perhaps the best quick example is the educational system. This has been profoundly shaken up. Curriculums and textbooks have been drastically revised. Teachers have been indoctrinated and re-indoctrinated. The satellite schools have been geared to turn out capable practical specialists and technicians, just as in the Soviet system. There has been a great increase in scientific and technical subjects as in the U.S.S.R. The amount and depth of Marxist-Leninist indoctrination have been even more pronounced than in the Soviet Union. The satellite texts and instruction are even more obviously infused with propaganda. In Poland something like one-fifth of the total number of class hours in elementary and secondary schools are devoted to "political" propaganda and other useful "social tasks."

In Hungary, Mr. Ibos, of the Ministry of Culture, described the change to me in the language of Communism: "Our educational system has been reorganized along scientific lines." He meant along the lines of dialectical materialism. Behind the Iron Curtain this is the foundation of "science."

In Czechoslovakia even the revised textbooks were attacked in 1951 as too "modest in presenting Marxist-Leninist ideology." They did not teach the youth "to love Stalin and Gottwald . . . the Soviet Army and the Czech Secret Police." The texts failed to emphasize the "community of interests between Czechoslovakia and the U.S.S.R." Geography texts were still under the "influence of bourgeois objectivism and cosmopolitanism." The selection of illustrations of bourgeois countries showed "natural beauties such as mountains, rivers and art treasures," and not "the real face of capitalism, such as slums, beggars, etc. . . ." History texts still "treated the pre-Munich republic with kid gloves." They did not show "its true reactionary face" and did not distinguish sufficiently between it and the "People's Democratic Republics."

Russian has supplanted other languages as the number one compulsory foreign language. It is required in Hungary and Czechoslovakia from the fifth grade up. In Poland, it is admitted that more than 60% of fifth graders are studying Russian. My interpreter chatted with Czech children in Russian on the streets of Prague.

The Communists claim there are 300,000 subscribers to U.S.S.R. newspapers in Czechoslovakia alone. Soviet cultural outlets have been created throughout the satellites to popularize

Soviet literature. Translations of Russian works have multiplied. The satellite peoples, who never previously had much taste for Russian literature, are now being introduced to it with a vengeance. The sales of Russian language books have shot up. In Hungary, Russian books now sell about 1,000,000 copies yearly. In Czechoslovakia the figure is three times greater.

In view of the handicaps they faced, the ominous fact is not that the Communists have made but little progress in the conversion of the satellite peoples. It is that they have made *some* progress, and some significant progress. This often seems most notable among the intellectuals who frequently set the styles for the next generation.

The Soviet attempt at the conversion of entire peoples, and peoples who enjoy a higher level of education and sophistication than the Russians—in a few years or even a few decades—is a major offensive effort which is both new and startling. In my judgment, and I believe most expert observers in these countries concur with this, the Soviet monopoly of power over education and the media of communications, plus the turn of the generations, put the odds on the Communists, if they retain their power. Much of the popular resistance to indoctrination in the satellites has rested on hopes of liberation. These hopes are fading. As they fade, the grave danger is that the resilience of opposition will diminish.

In their new-type psychological war of attrition, the Communists have a powerful arsenal of weapons. To the captive peoples, they seem firmly and ever more permanently entrenched in power. The possibilities of success for internal revolt in east Europe are dismissed even by outspokenly disloyal elements. Russia's nearness, as well as the presence of Russian armed forces stationed in Poland and Hungary, discourages hope of successful opposition to the U.S.S.R. even if the present local regimes could be overthrown.

However, we of the West, like the satellite peoples themselves, can reasonably hope that recognition within Russia and outside it will grow that the military strategic importance of these "buffer" countries, so much stressed by military historians, has faded under the impact of the aeroplane and the new weapons. Many now hope for a spread of so-called Titoism, and indeed I believe that there is every possibility that Russian policy will develop so as to favour more local autonomy for subject peoples. Inevitably, changes must come within the Russian hierarchy and government; and these may most unexpectedly and constructively affect the chances of the satellites for a greater measure of freedom. Indeed, the only sure prediction about the future within Russia is that there will be changes in the power structure.

Although the influence of Western culture is still strong throughout the satellite countries, it now appears to many observers to be a waning asset of the West. This may not necessarily turn out to be so, particularly if we in the United States do a better job to keep it alive. Our U.S. foreign policy should seek in every legitimate way to nourish Western influence. We should do far more than we are doing at present—for the refugees, in propaganda, in so-called "cultural relations," and on every available front. We should make no promises beyond our capacity to deliver.

We should and indeed must play for the long term and not the short. Above all, we must never give up hope. Year-in-and-year-out, and administration-in-and-administration-out, the long range interest and welfare of these captive people should continue to be a major goal in the United States foreign policy. This goal should be ours not because we are bound to these people by emotional ties, nor because our efforts may turn out to serve their best interests. This goal should be ours because it is also in America's own best interest and greatest tradition.

A FEW CLOSING COMMENTS AND SUGGESTIONS

The year 1955 saw a small but definite gain in communication between the two great areas of this tense and troubled world. Though the smiling Geneva conference of July was followed by a grim Geneva conference in November, the net at year's end was a slight advance toward understanding, an inching lift in the Iron Curtain.

During the year, the "hate" element of Soviet propaganda against the U.S., both at home and abroad, was relaxed. Unfortunately, we Americans cannot assume that this shift reflects any change of heart on the part of the Communist leaders. The last years of the Stalin era were unusually severe, even by Soviet standards. The moderate relaxation since Stalin's death in 1953 doesn't necessarily mean more than a return to earlier practices.

Stalin's last years were marked by a tightening of the Party's reins over all media of communication and by harsher and ever harsher demands for conformity. In some degree this was due to a hardening of Stalin's own personal attitude in the declining years of his life. To an even greater degree, it was the inevitable aftermath of war. The urgent needs of the fighting had led to neglect of the ideological training conceived as a necessity by Soviet leaders. Further, many Soviet citizens had been directly or indirectly exposed to Western propaganda. Worse from the Party standpoint, many for the first time had come into contact with Westerners and the West. The effect of such exposure was often devastating. The "decadent West," even in some of its less lustrous manifestations in the Balkans, did not conform to the image which Soviet propaganda had painted. The material comforts and the cultural achievements of the "rotten bourgeois nations" astonished the Soviet soldiers. Their exposure to the West revealed not only the backwardness of the Soviet Union but also the falsehoods of Soviet propaganda.

To combat this war-induced background, in 1945 and 1946 the Communist Party launched a major campaign of spiritual decontamination. Stalin's aim was to quarantine the entire Russian and satellite populations against "harmful outside influences." With his death, the pressures relaxed.

Thus many observers now report a decline in the Soviet regime's ideological fervour. As the Communists had increasingly entrenched themselves throughout the 1930s and 1940s, they had been compelled to face up to the problems of day-by-day management of a huge governmental structure. Their dreams of world revolution had receded into the future. Many experts today predict still further recession of this dream into a still mistier future.

The heroic days of the 1917 Revolution are remembered vividly today by only a very few. The dynamism the Revolution unleashed, and the enthusiasm and pioneering spirit it engendered, have long since been muted. Compromises had to be made. Retreats from some extreme positions became obvious necessities. The recklessness which was characteristic of the 1920s, say many observers, by now has matured into a new form of relative conservatism.

Measured against its highest claim—to alter human nature and create on a mass scale a new kind of human being—Communist propaganda has obviously failed. In his later years, Stalin seemed to have decided, as it were, to make a last desperate thrust to create the "new Soviet man," the dream man of Soviet propaganda. He seemed to be seeking to force people to conform to the theoretical standards of conduct which he had laid down. But today as always, the Russians are easily recognizable as human beings like the rest of us, with the same human strengths and the same human frailties.

Powerful as the Soviet propaganda may be, may not the Soviet leaders, when they expected it to change human nature, may not they themselves have been victims of it? If they believed this phase of their propaganda, they expected far too much. They seem now belatedly to be conceding that they no longer hope to achieve the impossible. But if they abandon their effort to create their dream man, they can console themselves with the fact that all other efforts, which have sought substantially or quickly to change human nature on a mass scale, have also failed.

Measured against, and compared with, other propaganda campaigns in history—and some have gone on for centuries, in contrast with the 38 years of intensified Red effort—the Communist propaganda achievement must be conceded to be a major one. Within Russia and the satellites, the Red propaganda has of course been bolstered by an unprecedented combination of terror and incentives. But we in the West will make a great mistake, and such a mistake can prove very dangerous to us, if because of this combination which we so intensely detest, we therefore underrate the achievements of the propaganda.

For 25 years or perhaps longer, most Soviet leaders have perceived that the interests of the Soviet state demand the education of new generations equipped to cope with a multitude of specialized and practical problems. The Soviet system has now reached a point of development where it continues to regenerate itself with an adequate and expanding supply of able and dedicated young leaders and administrators.

From this Soviet need for highly trained men may evolve one of the great decisive questions of our century. It is now shaping up within the Soviet Union in these terms: can the Communists increasingly educate a whole people, and in the technical fields up to the highest level of their capabilities, without undermining the people's faith in Communism itself? Can they produce a generation that is creative and original in all fields except in politics and economics—and unquestioning and obedient in these?

Allen Dulles suggests a negative answer to these questions. He suggests that universal education, up to a high level, may prove to be the Achilles' heel of Communism. Traditionally in the West, education has emphasized the role of the individual. It has encouraged the open mind, the questioning mind. It has attempted to stimulate originality and creativeness. Such qualities have been regarded as vital for the progress of society as well as for the development of the individual's own highest powers. To protect the unorthodox thinker on our Western university faculties, we give the professor permanent tenure; after his early years, he can't be fired even if he specializes in opinions unpopular in his field of scholarship. We have had many experiences which demonstrate to us in the West that the unpopular theory of today may tomorrow turn out to be the key to wisdom.

How then can the Communists rival our progress if they stifle unpopular theory? Can they indeed develop the needed originality and resourcefulness in science and technology without losing their monolithic cohesion? Can they develop their productivity to levels which match ours and still maintain their dedication to a dogma that seems to us so obviously warped and cockeyed?

My studies and observations lead me to suggest the growing possibility of an affirmative answer to these questions. The Communists have sought to resolve their dilemma by combining high quality in scientific and technical training and research with intensive courses and training in Marxist-Leninist-Stalinist ideology. If they can succeed in this combination, they may have discovered a "formula" more dangerous to us than the hydrogen bomb. If they can succeed in this, then why should

Benton Reports

they not believe they can conquer the world with ideas rather than bombs? If they can succeed, then time would not necessarily seem to be on our side in the period of competitive coexistence that lies ahead.

In my judgment, they are succeeding to an alarming and even terrifying degree. They are succeeding not only with the graduates of the *tekhnikums* and higher institutes; they are also succeeding with the average Soviet citizen. I have reported in the section on "The Soviet Educational System" plenty of evidence that the Communists have established the goal to give their young people all the technical education they can absorb. Indeed, they are coming closer to the achievement of this goal than we are in the U.S. I neither saw nor heard evidence that this education is producing resistance to the regime, or even skepticism about it.

Harry Schwartz, famous and able Russian-speaking Soviet expert for the *New York Times*, interviewed 500 "men in the street" in the Soviet Union in the weeks just preceding my own visit. I ran into him in Helsinki as he was coming out and I was going in. Very few of the men he interviewed suggested that the form or structure of the Soviet government should be radically changed and of these not one thought it could be.

(This is much as it is in the United States: as with us, the Soviet citizen doesn't admit that he wants to change his form of government, any more than we in the U.S. would suggest that we want a Czar or a Soviet dictatorship or even a government like that of France or of England. Many of the people Schwartz interviewed grumbled about specific shortcomings—and this would be true in any country, and most certainly was true in my home town of Fairfield, Conn., particularly during the Roosevelt administration—but Schwartz's Russians, like our own Americans who grumble most, are not critical of the system under which they live.)

Schwartz reported that many of his 500 challenged facets of the Soviet propaganda which bore directly on problems with which they had had personal experience—such as farmers, let us say, objecting to the setup on the state farms—but few if any ever challenged the propaganda in areas outside their own experience—such, for example, as the Soviet propaganda castigating the United States because it opposes Red China's entry into the United Nations.

In my interviews I concentrated on government officials, and I came out with roughly the same end-result as that of Harry Schwartz. Some of those I met deplored America's "misunderstandings." Often they seemed to go out of their way to "set me straight," as it were, on both the theory and practice of Communism. Some were so absorbed by the manifest destiny of their arguments that they seemed to expect me to accept them.

I know there may be many possible explanations for the vigour of the Marxist arguments given me by high officials. One is fear. The top men with whom I talked had to assume that I meant to report on the conversations. Besides, other Russians were present at all my interviews within the U.S.S.R. except the two with the prorectors of the universities of Kiev and Moscow. Another explanation could be a very simple one—natural pride of country in the presence of a foreigner. Still another—and this one the experts call "careerism"—is that those with whom I talked feel as they do because they have a personal stake in the regime; they support it as naturally and easily as a successful American businessman supports free enterprise. Indeed, some Russian experts believe the degree of indoctrination among the Russian people is in inverse ratio to the educational and economic status. But there was, in my judgment, still another factor required to explain my interviews. This is the alarming factor. I think the officials really believe what they say. They believe in the superiority of Communism and the right-

eousness of its cause. The courses in indoctrination and the propaganda have worked. Either that, or the Russian officials are consummate actors, and I do not believe a complex economy like that of the U.S.S.R. can be run by actors.

As further confirming evidence of my conclusions, we have the impressions of our diplomats who deal with the Russians at the UN and elsewhere. I have been one of these diplomats, and I believed then, as I do now, that my Russian counterparts believed the Marxist-Leninist-Stalinist line. We also have the confirming evidence of the interviews with refugees from the Soviet Union—refugees who have jumped over the border to the West. Among these refugees, one would expect criticism of the Soviet system to reach its peak. Yet I am told that the interviews reveal that a large proportion flee to the West as a consequence of specific grievances, because of miscarriages of the system, and not because of complaints against the system itself. Few of the refugees seek a new system for Russia.

The very magnitude of the propaganda program in the U.S.S.R. is bound to have its impact on its captive audience. Even if he tries, the average Soviet citizen can't escape the official message. It is blared at him from every quarter and at all times. He may not wish to believe what he is told. He may even think he is not heeding the official exhortations. Nevertheless, he assimilates the message. His environment is saturated with it and his mind absorbs more of it than he realizes. He cannot discuss his doubts freely with his associates. He is inhibited in thinking for himself. At long last, unconsciously or perhaps despite himself, he identifies himself with the thought patterns foisted on him.

There is evidence that Soviet officials themselves are aware of this. One factory manager, reminded that the workers disregard the slogans with which their plant is festooned, agreed readily. "But," he remarked, "the words are present in their minds, although they don't know it."

Many American visitors to the Soviet Union are struck by the uniformity of the political questions asked them about the West. Right now, many of the questions focus on America's Chinese policy, which is being stressed in the Soviet propaganda. Such uniformity is obviously a product of the indoctrination. Many Western visitors are impressed, too, by the confidence many Soviet citizens gratuitously express in the superiority of their Soviet system. Of 13 United States Senators and Representatives who visited the Soviet Union in the last half of 1955, not one reported any evidence of collapse; most expressed surprise at the atmosphere of confidence and stability. No informed observer—even the most antagonistic—reported any symptoms of incipient revolt.

* * * * *

My over-all impression of the many Soviet leaders I met is (1) that they are able and unusual men who would rise to the top in any competitive society; (2) that they are surprisingly ignorant in certain key areas and that this is dangerous; (3) that they are highly indoctrinated and zealous men and that this too is dangerous; and (4) that they are tough and aggressive men, ready to make many sacrifices to achieve desired goals.

Last December Mr. Nutting, Minister of State in the British Foreign Office, told the U.S. National Association of Manufacturers at its annual convention that the "summit" conference last summer in Geneva had made one thing clear: that the leaders of the most powerful nations had abandoned war because it is suicidal. Unfortunately we of the West cannot be sure that this is true to the extent that we can reduce our armament budgets. Indeed, there are strong arguments for increasing them. We Americans must continue to build up the so-called "positions of strength" of the West. But we must also assume that Mr. Nutting may be right; indeed we pray he is right. If he is, we

SOVIET INTERNATIONALISM, 1955

Below: Soviet sports teams invited the competition of western nations, both at home and abroad. A U.S. chess team went to Moscow in July. Shown here is a soccer match between the U.S.S.R. and France in Dynamo stadium, Moscow, in October

Bottom: The United States and the U.S.S.R. exchanged several delegations of business and professional experts. In the photograph Soviet newspapermen are interviewing Keith Funston (left), president of the New York Stock exchange, in October

Above: U.S. Ambassador Charles Bohlen and N. A. Bulganin strolling through a park during the latter's picnic for foreign diplomats and newspapermen in Moscow in August

Below: Engineers and workmen installing part of the Soviet exhibit at the conference on the peaceful uses of atomic energy held at Geneva, Switz., in 1955

are in for a long power struggle with the able and dedicated leaders of the Soviet Union. This is a struggle of a new type, to be waged with new weapons. It is a struggle for which the Western world is little prepared. It boils down to an effort by two great opposing forces to win the faith and confidence of the world's peoples.

A part of the pattern of this struggle, this emerging competitive coexistence, seems clear. To meet it and to come out on top, we of the U.S. must be prepared to extend help to the "uncommitted" millions of the earth's population. Such help must of course be keyed to the opportunities for economic and for political development and in line with our available resources. The concept of helpfulness, of good neighbourliness, of sharing our relative abundance, is not new for us, nor is it foreign to American traditions.

Of equal or perhaps even greater importance, we must dramatize, by example as well as precept, the vision of a society that is at once free, just and strong. If an uneasy truce in the use of force between nations is now in the offing, for the next decade or the next century, the competitive struggle in the field of ideas will remain. If we use such a truce constructively to improve America's position in this competitive struggle, the truce can deliver values to us which might make us impregnable.

We must seek with renewed vigour to show that our system can be of help to human beings everywhere in the development of their own freedoms and well-being. We must show that we are willing and able to help them develop the conditions of life in their own countries which will enable them to build up the highest standards attainable with their labour and resources. Apart from military policy and economic policy, I have often pointed out that there must be a third major facet to our foreign policy. This is to give to foreign peoples, to the best of our ability, the information they want and need, and the information we think they should have about us and the free world, and thus to encourage them and to help them in the realization of their own legitimate aspirations.

The Khrushchev-Bulganin trip to Burma and India helped to expose what I believe is "the wave of the future" in Russia's export policy. Russia cannot match us in the export of automobiles, tractors or business machines. She proposes to beat us with her ideas and her trained manpower. As Khrushchev left Burma he announced that the U.S.S.R. would build and equip a technological institute in Rangoon, as a gift to the Burmese people from the Russian people—and staff it, of course, with Russian technicians. Here is an example of how "The Voice of the Kremlin" can prove more dangerous than its armies.

We of the U.S. are now called on to compete with a Soviet system of education in technology and many specialties that milks the best out of all available brains—that literally forces its smartest boys and girls to get all the education they can absorb, and then channels them into the usages of the State. As the supply of highly trained Russian technologists continues to expand, focus will centre on competition with the free world in Asia, Africa and Latin America. In these areas the peoples have a tremendous range of practical problems to which trained men can provide practical answers: problems of agriculture, health, industrial production and communications. This is the language they want to talk. We can talk it better than the Russians, if we will so prepare ourselves. We must learn better to share what we know about the operation of an economic system—what we have learned which may in turn help them in their hoped-for growth. We must seek to show them, in their terms, that they are far more likely to realize their most cherished ambitions by the methods of freedom, and in association with the free nations, than by totalitarian methods or in totalitarian company.

We must demonstrate that their prosperity and their peace lie with us and not with the Communists.

This is no mere propaganda duel. This involves more than ideas, words and manpower. Intertwined into it is the all-important "propaganda of the deed"—our own actions at home and abroad.

The Communists—not ourselves—developed the doctrine that words can speak louder than deeds. Now their words indicate that they plan to supplement their propaganda with a much higher quota of deeds. This greatly enhances the power of their competitive threat. One highly trained and indoctrinated Russian engineer, teaching in the Russian dominated Rangoon Institute, can carry a greater competitive threat to us than thousands of Russian books and newspapers. Indeed, he can be even more threatening than the Russian export of many thousands of tons of steel.

The Russians now clearly are showing their long-term, confident conviction that education "by order" will defeat education "by will." This is one of the greatest challenges now facing the American people. It is but little understood by us, in part because it has received but little discussion. From the way we learn to face up to it, I like to hope, may come expanded opportunities for many of our young people. Today, perhaps fewer than one-half of our youth with the intellectual capacity to benefit from a college education are getting one. In the great reserve of untrained manpower we have our own potential technicians, engineers and leaders for the free world.

Our technical experts must also be trained in the liberal arts, so that they will understand our great traditions of democracy and freedom. Our own surplus of technologists, willing to serve overseas if opportunity calls, must serve not only as builders of dams and steel mills, but also as representatives of Western culture and of the American Dream. They may be far more important to us than the billions of dollars worth of arms which we ship abroad annually. They can prove decisive in the struggle of the next quarter century.

I have used education as a prime example of how we in the United States must improve our methods if we are to hold our own in the new competition. Our reply to the Russians must be: not only the right actions, but the right words—and enough words to describe our actions—and enough of the right actions at home as well as abroad. Foremost in the field of action at home is the need for trained manpower for service overseas. It is one way in which we must now prepare ourselves as we build our defenses of the future, for the further intensification of the duel for the minds of men.

We of the West believe that our freedom in the Western world is incomparably superior to Communism. We must welcome "competitive coexistence" as a status far preferable to the imminent danger of war. In 1955 the Soviet leaders of their own will and for their own purposes created tiny openings in the Iron Curtain which did not before exist. We must now seek to develop such openings into opportunities for improved relationships and for more constructive forms of interchange. We must seek to convert the competition of the future into free and open competition. We must not fear it or allow it to give us the jitters.

Above all, we must continue to strive to present, even to indoctrinated Communists, the spectacle of a good society which is a constant alternative to their own. By being our own best selves, by acting rightly and helpfully in the world, and by talking clearly and well, we shall pursue our best and most lasting hope of winning and holding the free world.

INTRODUCTION

SINCE its inception in 1938, millions of copies of the *Britannica Book of the Year* have been printed and distributed throughout the world. The aim of this annual is to report with objectivity national and international events and the activities of people significant in the news. And it is a commentary on the character of life in the United States that there are no official or unofficial censorship restrictions to colour the book's reflection of the present-day world. If the book lacks complete objectivity it cannot be laid to the coercion of an iron fist. Americans can be grateful that publishing, in this country at least, is free.

* * * * *

This 19th issue of the *Britannica Book of the Year* offers a green section carrying three feature articles.

The first in the book is Pierre Berton's "Canada: The Land and the People"—an attempt to analyze the growth of this influential area of the world. It discusses the future possibilities of Canada and traces the history and characteristics of the remarkable people who live within its borders. Mr. Berton is managing editor of *Maclean's* magazine.

The possibility of space travel is one of the most controversial subjects of our time. The second special article is Commander R. C. Truax's "Dawn of the Space Age," a factual account of the development of the rocket. Commander Truax describes how a journey around the moon in a spaceship might be accomplished. He explores the possibilities of achieving the farthest reaches of space—even to the planets and the stars.

Commander Truax has designed and developed rocket power plants. He holds the Robert H. Goddard award in the field of liquid-propellant rockets. His efforts were instrumental in forming the Space Flight committee within the American Rocket society, of which he is vice-president. The recommendations of this committee were the basis of the recently announced government project to launch satellites to circle the earth.

The third feature and in many respects the most exciting—the last article to go to the printer this year—is William Benton's current report on life behind the Iron Curtain. Mr. Benton, publisher of the *Encyclopædia Britannica*, was able to visit the Soviet Union in October and November. He gives a first-hand report on avenues of communication in the Soviet Union. His valued article attempts to show the effect of Communist propaganda on the Russian people and those of the satellite countries and what the west might do to combat it. Senator Benton's trip to the Soviet Union, with Mrs. Benton and their son John, was a matter of extensive newspaper interest throughout the United States and the world.

WALTER YUST

EDITORS AND CONTRIBUTORS

WALTER YUST, *Editor of Encyclopædia Britannica and of the Britannica Book of the Year*

HOWARD E. KASCH, *Managing Editor of the Britannica Book of the Year*

PHILIP W. GOETZ, *Picture Editor*

- 30 Rizal day, Philippines.
- 31 New Year's Eve (Hogmanay).

CALENDAR OF EVENTS • 1955

JANUARY

1 U.S. Foreign Operations administration began supplying direct financial aid to the states of south Vietnam, Cambodia and Laos in Indochina.

British government transferred to Egyptian control an 87-mi. pipeline from Suez to Cairo.

2 José Ramón Guizado took over as president of Panamá upon the assassination of José Antonio Remón.

3 U.S. state dept. declared 27% of the area of the U.S. off limits to soviet citizens.

U.S. civil service commission reported that 3,002 security risks had been dismissed from federal positions during the period May 28, 1953–Sept. 30, 1954.

4 Federal reserve board raised margin requirements on purchases of stocks from 50% to 60% of the purchase price.

Japanese government announced that the U.S. had agreed to pay \$2,000,000 compensation for the damage and injury to Japanese fishermen after the Bikini hydrogen bomb explosion in 1954.

U.S., Britain and France supported a demand by Israel in the UN Security council that Israeli ships be permitted to use the Suez canal without Egyptian interference.

5 International Bank for Reconstruction and Development announced the expulsion of Czechoslovakia, its only soviet-bloc member.

At the first meeting of the 84th congress Rep. Sam T. Rayburn (Dem., Tex.) was elected speaker of the house of representatives and Sen. Walter F. George (Dem., Ga.) was elected president pro tem. of the senate.

Yugoslavia and the U.S.S.R. signed a one-year trade agreement in Moscow.

Indonesian government declared a state of war in a group of the Molucca Islands in eastern Indonesia where rebels were in partial control.

6 Pres. Eisenhower in his annual state of the union message to congress appealed to it for unhesitating co-operation

with his administration in a common quest for peace, prosperity and freedom.

Trading on the New York Stock exchange rose to 5,300,000 shares, the highest volume since Sept. 5, 1939.

8 British government rejected a soviet request that it should join with the soviet government in circulating to other participants in the 1954 Geneva conference a Vietminh petition alleging violation of the armistice agreement by south Vietnam, France and the U.S.

Soviet government released two U.S. citizens who had been held in soviet labor camps.

French government disclosed a new plan to establish control over arms production in the member nations of the proposed western European union.

N.Y. state mental hygiene dept. reported that mental patients had shown improvement after being treated with two new drugs named thorazine and reserpin.

9 U.S. Atomic Energy commission announced plans to help private industry develop and operate experimental atomic power plants.

10 Pres. Eisenhower in a special message to congress asked for new powers to reduce foreign trade barriers, including a 3-year extension of the Reciprocal Trade Agreements act.

Council of the Organization of American States called on Nicaragua and Costa Rica to take steps to avoid any aggravation of tension between them.

UN Secy. Gen. Dag Hammarskjöld and Chinese Communist Premier Chou En-lai completed discussions at Peking regarding the release by China of U.S. airmen captured during the Korean war.

Chinese National defense ministry stated that Chinese Communist planes had carried out a day-long raid on the Nationalist-held Tachen Islands, 200 mi. north of Formosa.

11 Joseph E. Finnegan of New York was nominated to be director of the Federal Mediation and Conciliation service.

Pres. Eisenhower urged con-

gress to raise the pay of federal employees and to increase postal rates.

12 Costa Rican Pres. José Figueres in a radio broadcast accused Nicaraguan Pres. Anastasio Somoza of supporting a revolt against the Costa Rican government.

13 Pres. Eisenhower asked congress to inaugurate a military reserve plan, extend the selective service system and raise military pay, allowances and benefits by about \$942,000,000 a year.

14 Yugoslavia and Hungary signed their first trade agreement since 1948.

Organization of American States condemned the attack by foreign forces on Costa Rica and asked Nicaragua to take stronger measures to stop the flow of war equipment into Costa Rica from Nicaragua.

Senate voted 84 to 0 to continue the investigation of communism.

Senate banking and currency committee voted to conduct what was termed a friendly investigation of the stock market.

15 Ricardo Arias Espinosa was sworn in as president of Panamá after Pres. José Ramón Guizado was impeached for alleged participation in the assassination of Pres. José Antonio Remón.

Soviet government renewed its demands for four-power talks on the reunification of Germany.

16 U.S. government sold 4 fighter planes to Costa Rica in response to a request from the council of the Organization of American States.

17 Pres. Eisenhower sent to congress a budget for the fiscal year beginning July 1, 1955, which estimated expenditure at \$62,408,000,000 and revenue at \$60,000,000,000, leaving a prospective deficit of \$2,408,000,000.

18 Chinese Communist government announced the capture in an amphibious assault of Nationalist-held Yikiang Island, near the Tachen Islands.

General Motors Corp. announced a \$2,000,000 annual program to aid higher education.

Federal District Judge Luther Youngdahl dismissed for the second time two perjury indictments against Owen Lattimore, former U.S. state dept. adviser on the far east.

19 Pres. Eisenhower's press conference was filmed for television and news reels for the first time.

U.S. state dept. barred soviet citizens residing in the U.S. from photographing or sketching U.S. military installations, ports, power plants and other strategic areas.

20 Pres. Eisenhower in his annual economic report to congress forecast continuing U.S. economic expansion.

State of siege was declared throughout Guatemala after an unsuccessful uprising against the government.

Soviet government announced that industrial production in 1954 had increased by 13% over 1953.

Japanese air force received its first shipment, totalling 59 aircraft, under the U.S.-Japanese mutual defense assistance program.

21 Liberian Pres. William V. S. Tubman announced a loan of \$15,000,000 from the U.S. Export-Import bank for highway construction.

British government protested to Argentina against the establishment of an Argentine scientific base at Vahsel bay in the Weddell sea in the Falkland Island dependencies.

22 New Norwegian government headed by Einar Gerhardsen as premier assumed office in succession to that of Oscar Torp.

British government strongly protested to the Chinese Nationalist government the sinking of a British freighter during a Nationalist air attack on shipping in Swatow.

24 Pres. Eisenhower asked congress to authorize the use of U.S. armed forces to defend Formosa and the Pescadores islands.

25 Soviet government formally terminated the state of war between the U.S.S.R. and Germany.

Panamá and the U.S. signed a new treaty increasing U.S. payments for rights to the Panama Canal Zone from \$430,000 to

For elections and disasters of 1955, see under those headings in the text. For obituaries of prominent persons who died during 1955, see under the entry Obituaries.

JANUARY—Continued

\$1,930,000 a year.

Rebel invasion of northern Costa Rica was reported to have been ended when several hundred insurgents crossed into Nicaragua and surrendered for internment.

Budget Director Rowland R. Hughes ordered the withdrawal wherever possible of federal agencies from activities in competition with private business.

26 Pres. Paul E. Magloire of Haiti arrived in Washington, D.C., for an official visit to the U.S.

27 U.S. far east air force headquarters announced the dispatch of a fighter-bomber wing from Okinawa and the Philippines to Formosa for temporary duty.

Secy. of State John Foster Dulles barred visits to Communist China by relatives of 17 U.S. airmen imprisoned there.

Former Sen. John Sherman Cooper of Kentucky was nominated by Pres. Eisenhower to be U.S. ambassador to India.

28 U.S. government protested to Peru against the detention and fining of two U.S. vessels for allegedly infringing Peruvian fishing rights.

Senate approved by vote of 85 to 3 a joint resolution already approved by the house of representatives authorizing Pres. Eisenhower to use U.S. armed forces in the defense of Formosa and the Pescadores islands.

29 Chinese Communist radio demanded that the UN force U.S. withdrawal from Formosa and adjacent waters.

30 Adm. Felix B. Stump, U.S. Pacific fleet commander, stated at Taipei, Formosa, that his forces were prepared to begin the immediate removal of Chinese Nationalist troops and civilians from the Tachen Islands.

31 U.S. supreme court held that the legitimate theatre and professional boxing were subject to the federal antitrust laws.

Conference of the prime ministers of the Commonwealth of Nations countries opened at London, Eng.

Pres. Eisenhower submitted to congress a proposed national health program similar in many of its provisions to that rejected by congress in 1954.

FEBRUARY

1 Senate consented, by vote of 82 to 1, to the ratification by the U.S. of the southeast Asia collective defense treaty.

Princess Margaret, sister of Queen Elizabeth II of the United Kingdom, arrived at Port of Spain, Trinidad, for a month's tour of the British West Indies.

Social Democrat H. C. Hansen was appointed prime minister of Denmark in succession to Hans Hedtoft, deceased.

2 Central committee of the Soviet Communist party published a statement confirming that heavy industry would continue to have priority in the next stages of soviet development.

Egyptian Premier Gamal Abdel-Nasser confirmed that Egypt would withdraw from the Arab league collective security pact, if Iraq concluded a proposed defense agreement with Turkey.

Indian and Soviet governments signed at New Delhi an agreement for the construction in India of an iron and steel plant with an initial capacity of 1,000,000 tons.

3 Communist China rejected a UN invitation to send representatives to the UN Security council to discuss hostilities off the Chinese mainland.

U.S. commerce dept. reported that personal income before and after taxes had reached the record totals of \$286,500,000,000 and \$254,000,000,000, respectively, in 1954.

Prague radio announced that Czechoslovakia had ended the state of war with Germany.

Allied high commission in Germany published a law providing for the completion of allied plans for the deconcentration of I. G. Farben and the termination of active allied control of the property.

4 Pakistan's decision to become a republic but remain within the Commonwealth of Nations was announced at the conference of commonwealth prime ministers in London.

5 Premier Pierre Mendès-France of France and his cabinet resigned after the national assembly voted, 319 to 273, against his North African policy.

U.S. jet fighters shot down 2 of 8 attacking Communist jets over the Yellow sea between Communist China and Korea.

U.S. state dept. announced that the U.S. 7th fleet had been ordered to assist the Chinese Nationalists in the evacuation of the Tachen Islands.

6 Vice-Pres. and Mrs. Richard M. Nixon left Washington, D.C., by plane for a four-week good-will tour of the Caribbean.

Pres. Eisenhower in a letter to state governors urged that all states enact laws to give servicemen overseas effective opportunities to vote.

7 International committee of the Red Cross announced the election of Prof. Leopold Boissier of Switzerland as president, effective Sept. 1, 1955.

Soviet supreme council approved a 1955 budget estimating revenue at 590,192,000,000 rubles (\$147,548,000,000) and expenditure at 563,482,000,000 rubles (\$140,870,500,000).

8 Georgi M. Malenkov resigned as Soviet premier; on the nomination of Nikita S. Khrushchev, first secy. of the Soviet Communist party, Marshal Nikolai A. Bulganin was unanimously elected to succeed him by the supreme council.

Pres. Eisenhower proposed to congress a three-year \$7,000,000,000 emergency federal-state-local school construction program.

Pakistan announced the confiscation of 1,100,000 ac. of land from 124 wealthy families.

9 Marshal Georgi K. Zhukov was appointed Soviet minister of defense.

American Federation of Labor and the Congress of Industrial Organizations made public an agreement setting forth the details for their merger.

Senate consented, by vote of 64 to 6, to the ratification by the U.S. of the mutual defense treaty with Nationalist China.

Green H. Hackworth of the U.S. was elected president of the

International Court of Justice in succession to Sir Arnold McNair.

Chief court of Sind, Pakistan, held to be illegal the action of the governor general in dissolving the Pakistani constituent assembly.

10 British house of commons rejected, by vote of 245 to 214, a motion for the suspension of the death penalty for a five-year trial period.

11 U.S. state dept. announced that the evacuation of the Chinese Nationalists from the Tachen Islands had been completed.

12 U.S. Atomic Energy commission announced the sale to India of ten tons of heavy water for use in research on peaceful applications of atomic energy.

Lt. Gen. John W. O'Daniel, chief of the U.S. military mission, assumed charge of the organization and training of the south Vietnamese army.

Soviet government made public its plan for a ten-power non-UN conference on Formosa from which Nationalist China would be excluded.

13 Commission on the Organization of the Executive Branch of the Government headed by former Pres. Herbert C. Hoover recommended a sweeping federal employment program to attract and hold more high-calibre workers.

New Syrian cabinet was formed by Sabri el-Assali in succession to that of Faris el-Khuri.

14 UN Security council suspended its efforts to halt the fighting between Nationalist and Communist China over small islands off the Chinese mainland.

15 Rumanian legation at Berne, Switz., was seized by six Rumanian anti-Communists.

U.S. Atomic Energy commission revealed that the hydrogen bomb tested by the U.S. in the Pacific in 1954 had polluted an area of 7,000 sq. mi. with radioactive materials.

20 Chinese Communist government announced that it was increasing the face value of its currency 10,000 times.

Eric A. Johnston, special U.S. envoy to the middle east, opened negotiations at Jerusalem on the U.S.-sponsored plan to develop Jordan and Yarmak river resources to benefit jointly the states of Israel, Jordan, Lebanon and Syria.

21 Communist forces in Korea were accused at a meeting of the military armistice commission of illegally bringing MIG jet fighters into North Korea.

David Ben-Gurion, premier of Israel from 1948 to 1953, rejoined the Israeli cabinet as defense minister.

22 Pres. Eisenhower submitted to congress a ten-year federal-state-local highway construction program which would cost a total of \$101,000,000,000.

23 French national assembly voted, 369 to 210, to confirm Radical leader Edgar Faure as premier.

Democratic proposals for a federal income tax reduction of \$20 a person were denounced as highly irresponsible by Pres. Eisenhower.

Council of the Southeast Asia Treaty organization opened its first meeting at Bangkok, Thailand.

Pres. Eisenhower stated that the U.S. would stop the testing of atomic weapons only under a workable disarmament agreement with effective international inspection.

24 Bank of England raised its rates on loans to banks from 3½% to 4½% as an anti-inflation measure.

Mutual security treaty between Turkey and Iraq was signed at Baghdad.

U.S. court of appeals at Washington, D.C., held invalid a regulation of the Federal communications commission limiting to five the number of television stations which a single individual or corporation could own or control.

Council of the Organization of American States requested Costa Rica and Nicaragua to set up a peace commission to settle their future disputes.

25 Chinese Nationalist government disclosed the evacuation and abandonment of the Nanki Island group.

House of representatives approved a bill deferring corporation and excise tax reductions from April 1, 1955, to April 1, 1956, and containing a provision for a flat \$20 per person income tax reduction.

Subcommittee of UN disarmament commission opened a conference at London on disarmament and atomic control questions.

26 U.S. Secy. of State Dulles conferred at Rangoon with Burmese Premier U Nu on Southeast Asia Treaty organization developments.

Prof. Cecil F. Powell, British physicist and Nobel prize winner, estimated that the U.S. had 4,000 atomic bombs and the U.S.S.R. 1,000.

27 West German bundestag approved the Paris agreements providing, among other things, for the termination of the allied occupation and the admission of western Germany to NATO and the projected western European union.

28 Egyptian and Israeli forces fought a serious engagement in the Gaza area.

Permanent council of the Greece-Turkey-Yugoslavia treaty organization held its first meeting at Ankara, Turkey.

MARCH

House of representatives passed by vote of 223 to 113 a compromise bill approved by the senate increasing the salaries of congressmen and federal judges by an average of 50%.

Bruno Pontecorvo, British atomic scientist who disappeared in 1950, revealed that he had been working in the U.S.S.R. since his disappearance.

George W. Perkins was nominated by Pres. Eisenhower to be permanent U.S. representative on the council of NATO.

2 Norodom Sihanouk, king of the Indo-Chinese state of Cambodia, abdicated in favour of his father, Prince Suramarit.

U.S. post office dept. began withholding delivery to private U.S. subscribers of *Pravda* and

Izvestia, the leading soviet newspapers.

Soviet government ordered the expulsion of the Rev. Georges Bissonnette, a U.S. Roman Catholic priest stationed in Moscow.

3 Arkady A. Sobolev was named to succeed Andrei Y. Vishinsky, deceased, as chief Soviet delegate to the UN.

G. Keith Funston, president of the New York Stock exchange, told the senate banking and currency committee at the opening of its investigation of the stock market that he was not alarmed by recent stock market advances.

Haiti and the U.S. signed a treaty of friendship, commerce and navigation at Port-au-Prince.

U.S. state dept. announced that it had proposed to Sweden and Switzerland that the neutral nations supervisory commission in Korea be abolished because of the obstructionist tactics of the other members (Czechoslovakia and Poland).

4 UN Security council urged Egypt and Israel to avoid further violence.

Central committee of the Hungarian communist party passed a resolution severely criticizing Premier Imre Nagy.

5 Pres. Eisenhower named Gen. of the Army Omar N. Bradley (ret.) as head of a seven-man commission to survey the problem of veterans' pensions.

U.S. Atty. Gen. Herbert Brownell, Jr., made public revised procedures for the administration of the federal employee security program.

6 Egypt, Saudi Arabia and Syria announced agreement on measures to strengthen the Arab structure politically, militarily and economically.

Ford foundation disclosed the appropriation of \$50,000,000 to increase the salaries of faculty members of private U.S. colleges and universities.

7 Gen. Maxwell D. Taylor was appointed U.S. commander in chief in the far east and head of the UN far east command.

U.S. supreme court held, 4 to 3, that a foreign government which sued in a U.S. court could

MARCH—Continued

not use the legal immunity of a sovereign to shield it from counterclaims of U.S. citizens.

Albanian news agency announced the rejection by Albania of a U.S. offer of surplus food.

8 Secy. of State Dulles stated in a nationwide address that the U.S. defense of Formosa was not necessarily confined to the static defense of Formosa and the Pescadores islands alone.

Pres. Eisenhower named Dillon Anderson of Texas to be his special assistant for national security affairs.

9 U.S. Foreign Operations administration announced approval of a \$100,000,000 program of economic and technical aid to Cambodia, Laos and south Vietnam in the fiscal year ending June 30, 1955.

10 Pres. Eisenhower affirmed the intention of the U.S. to continue its efforts in the defense and development of western Europe, if the 1954 Paris agreements on Germany were ratified.

Soviet government and communist party issued a decree giving collective farm leaders more authority to decide local agricultural policy.

OCTOBER—Continued

Capt. Peter Townsend.

Secy. of State Dulles announced that the U.S. would lift its restrictions on travel by U.S. citizens to the U.S.S.R. and its east European satellites other than Albania and Bulgaria.

Pres. Carlos Castillo Armas of Guatemala arrived in Washington, D.C., for a state visit.

NOVEMBER

Secy. of State Dulles and Generalissimo Francisco Franco of Spain reaffirmed after a conference in Madrid the spirit of collaboration between the U.S. and Spain.

Burma and Poland were revealed to have signed a three-year trade agreement.

2 Rear Adm. Richard E. Byrd (ret.) was placed in charge of all U.S. activities in the antarctic.

Vincent du Vigneaud of the U.S. was announced as the winner of the 1955 Nobel prize for chemistry; the physics prize went to Polykarp Kusch and Willis E. Lamb, also of the U.S.

3 Israeli Knesset, by a vote of 73 to 32, confirmed David Ben-Gurion as premier at the head of a coalition cabinet.

Shellfire continued in the El Auja demilitarized zone after a night battle between Egyptian and Israeli forces.

U.S. public health service was revealed to have developed a vaccine promising substantial immunity against "cold-type" infections.

The Cocos Islands in the Indian ocean were formally transferred from British to Australian sovereignty.

Office of the UN high commissioner for refugees was designated as the winner of the 1954 Nobel peace prize; the award for 1955 was deferred.

4 Emperor Haile Selassie of Ethiopia promulgated a new constitution granting the Ethiopian people the right to vote for the first time.

5 French government formally recognized Mohammed ben Youssef as sultan of Morocco.

6 Trustees of the Ford foundation announced that common stock of the Ford Motor company would go on public sale for the first time in Jan. 1956.

Secy. of State Dulles and Yugoslav Pres. Tito conferred at Brioni Island in the Adriatic sea.

7 Defense dept. gave the dept. of the army complete responsibility for purchasing and handling all food required by the U.S. armed forces.

U.S. supreme court held, by a vote of 6 to 3, that U.S. civilians could not be tried by court-martial for crimes committed while in military service; in a unanimous decision it banned racial segregation in public parks, playgrounds and golf courses.

8 Soviet foreign minister Molotov at the Geneva conference of foreign ministers rejected reunification of Germany on any but Soviet terms.

UN general assembly after a record total of 21 ballots failed to choose between the Philippines and Yugoslavia for a seat on the UN Security council.

U.S. Public Buildings Commissioner Peter A. Strobel resigned after denying charges that he had used his position to further the interests of his private engineer-consultant firm.

9 French government named André Dubois, Paris prefect of police, as French resident general in Morocco.

Union of South Africa withdrew from the UN general assembly in protest against continued UN inquiries into its racial segregation policies.

British Prime Minister Eden offered his own services and those of his government in settling the dispute between Israel and the Arab states.

10 Soviet Foreign Minister Molotov made a formal detailed attack on Pres. Eisenhower's plan for aerial inspection and exchange of military information between the U.S.S.R. and the U.S.

12-member bipartisan committee on government security was named to review the entire U.S. government loyalty-security program and recommend ways to end abuses.

Britain and Egypt announced

an informal agreement on the regulation of shipping movements in the gulf of Aqaba at the head of the Red sea.

11 Pres. Eisenhower left Fitzsimons Army hospital in Denver, Colo., and flew to Washington, D.C.

Brazilian army seized control of the government in a bloodless coup; senate speaker Nereu Ramos was designated as provisional president, until Pres.-elect Juscelino Kubitschek would assume office Jan. 31, 1956.

British military experts issued a report proposing a sweeping reorganization of the British army, including the creation of a British foreign legion.

12 Soviet Communist Party Secy. Khrushchev revealed that the U.S.S.R. had developed a twin-jet medium bomber with a range of about 3,100 mi.

French government announced its decision to resume the shipment of arms to Egypt.

13 Provisional Argentine government of Maj. Gen. Eduardo Lonardi was overthrown and Maj. Gen. Pedro Aramburu was sworn in as provisional president.

14 Poland and Yugoslavia signed a number of economic and technical co-operation agreements at Warsaw.

John G. Graham admitted in Denver, Colo., that he had planted a time bomb which blew up a United Air Lines passenger aircraft with loss of 44 lives, including his mother, whose life he had insured.

Temporary executive offices were set up for Pres. Eisenhower in Gettysburg, Pa.

15 Adlai E. Stevenson formally announced that he would seek renomination in 1956 as the presidential candidate of the Democratic party.

U.S. state dept. announced that it had cancelled a visa for Archbishop Boris of the Russian Orthodox Church because the U.S.S.R. had insisted upon privileges not accorded to U.S. clergymen in the U.S.S.R.

Pres. Eisenhower stated that the U.S. would play its full part in working for a peaceful settlement of the dispute between Israel and the Arab states.

16 Conference of the foreign ministers of the U.S., Britain, France and the U.S.S.R. at Geneva, Switz., ended without any agreement on any of the points on its agenda.

Sultan Mohammed ben Youssef returned to Rabat, French Morocco, after more than two years of exile.

Abba Eban, Israeli ambassador to the U.S., formally requested the U.S. to sell Israel specific types of arms on the most lenient conditions.

17 Premier Hussein Alaoui of Iran was shot and slightly wounded by a Moslem religious fanatic in the Shah mosque in Tehran.

18 Mexico made its final payment to the U.S. under the claims convention of 1941.

Pres. Eisenhower designated Boyd Leedom to serve as chairman of the National Labor Relations board and appointed Stephen S. Bean of Maryland to be a member of the board.

Britain and Belgium signed 10-year atomic energy agreement in London.

Soviet Premier Bulganin and Communist Party Secy. Khrushchev arrived at New Delhi, India, for an official good will visit.

19 Princeton's football team defeated Dartmouth, 6 to 0, to win the Ivy league title; Ohio State defeated Michigan, 17 to 0, for the Big Ten title; Oklahoma defeated Nebraska, 41 to 0, for the Big Seven title; University of California at Los Angeles defeated Southern California, 17 to 7, for the Pacific coast conference title.

20 Gov. Theodore R. McKeldin of Maryland ordered the immediate desegregation of the Maryland national guard.

Jordanian Deputy Prime Minister Hazza el-Majali announced that Jordan would remain outside the Middle East Treaty organization at least temporarily.

DECEMBER—Continued

Los Angeles Rams defeated the Green Bay Packers, 31 to 17, to win the western conference title in the National Football league.

12 Ford foundation announced a record grant of \$500,000,000 to 4,157 privately supported U.S. colleges, universities and hospitals.

13 Indian Prime Minister Nehru and Soviet Premier Bulganin issued a joint communiqué in New Delhi declaring that disarmament was the only means of establishing world peace.

Plan for the admission of 18 new members to the UN failed when Nationalist China vetoed the admission of Outer Mongolia and the U.S.S.R. vetoed 13 non-Communist nations.

Otto John, west German intelligence official who defected to east Germany in 1954, returned to western Germany.

14 Hugh Gaitskell was named to succeed Clement R. Attlee as leader of the British Labour party.

UN resolved the deadlock over the admission of new members and elected to membership Albania, Austria, Bulgaria, Cambodia, Ceylon, Finland, Hungary, Ireland, Italy, Jordan, Laos, Libya, Nepal, Portugal, Rumania and Spain; Japan and Outer Mongolia were excluded.

15 Generalissimo Franco of Spain declared that Spain would not permit the establishment of a western democratic system of government in the Spanish zone of Morocco.

Nashua, champion U.S. race horse of 1955, was sold for \$1,251,200 to a syndicate of bidders by the estate of William Woodward, Jr.

Soviet Premier Bulganin and Communist Party Secy.

Khrushchev arrived in Kabul, Afghanistan, on an official visit.

U.S.S.R. vetoed in the UN Security council a resolution recommending that Japan be considered for UN membership in 1956.

16 North Atlantic council declared that Soviet tactics in the middle east and growing Soviet military strength offered a new challenge to the free world.

U.S. government accused Communist China of violating its agreement to release 14 U.S. civilians still in Chinese prisons.

UN general assembly approved, by vote of 56 to 7, Pres. Eisenhower's proposal to promote world disarmament through a free aerial inspection and an exchange of military blueprints.

17 U.S. and British governments assured Egypt of aid in financing the construction of the proposed \$1,300,000,000 High Dam at Aswan on the Nile river.

18 Saar parliamentary elections were won by pro-German parties favouring the union of the Saar with western Germany.

Moscow radio announced that the U.S.S.R. had granted a loan of \$100,000,000 to Afghanistan.

19 Sudanese house of representatives adopted a resolution declaring the Sudan's independence and requesting that it be recognized at once by Britain and Egypt.

Jordanian Premier Hazza el-Majali resigned following rioting over a proposal that Jordan join the Middle East Treaty organization.

Pres. Eisenhower accepted the resignation of Nelson A. Rockefeller as his special assistant for psychological strategy.

Afghan Premier Mohammed Daud Khan stated at a news

conference that receipt of Soviet aid would not alter Afghanistan's policy of neutrality.

20 UN general assembly elected Yugoslavia to the UN Security council under a compromise arrangement whereby Yugoslavia would resign after one year and be replaced by the Philippines.

British Prime Minister Eden announced a substantial reshuffling of his cabinet; Selwyn Lloyd became foreign secy. in place of Harold Macmillan, who became chancellor of the exchequer to replace R. A. Butler, who was named lord privy seal and leader of the house of commons.

21 King Hussein of Jordan swore in a caretaker government headed by Ibrahim Hashem to hold office pending new parliamentary elections.

Finances of the Ford Motor company were disclosed in full for the first time in a registration statement filed with the U.S. Securities and Exchange commission preliminary to the first public sale of the stock of the company.

22 Paraguayan government was reported to have put down an uprising against it.

Gov. Goodwin J. Knight of California declared a state of emergency in northern California as a result of severe floods which were sweeping the area.

24 Pope Pius XII in his annual Christmas message gave support to proposals for international disarmament based in part on the renunciation of nuclear weapons.

Pres. Eisenhower declared flooded sections of western Nevada a major disaster area and ordered federal aid speeded there.

25 Communist China and eastern Germany signed in Peking a treaty of friendly co-operation and a protocol for cultural co-operation.

26 Saudi Arabia was revealed to have placed its armed forces with those of Egypt and Syria under a single commander, Maj. Gen. Abd el-Hakim Amer of Egypt.

Cleveland Browns defeated the Los Angeles Rams, 38 to 14, to win the National Football league title.

27 U.S. automobile fatalities over the Christmas week-end were announced to have reached the record total of 609.

28 Pres. Tito of Yugoslavia arrived in Cairo, Egypt, on a state visit.

Pres. Eisenhower flew from Washington, D.C., to Key West, Fla., for a medically advised rest.

Soviet supreme council approved a 1956 budget providing for expenditure of 569,600,000,000 rubles.

29 Peace negotiations collapsed between Malayan officials and Communist guerrilla leader Chin Peng.

Soviet Communist Party Secy. Khrushchev in a speech to the supreme council sharply attacked Pres. Eisenhower's plan for mutual aerial inspection and exchange of military information.

30 U.S. government reaffirmed that U.S. foreign policy had as one of its aims the peaceful liberation of captive peoples.

U.S. production of passenger cars in 1955 was estimated at the record figure of 7,940,862 by trade sources; truck production totalled 1,247,799.

Volume of trading on the New York Stock exchange for 1955 reached 649,602,291, the highest since 1933.

31 British government banned all further export of surplus war material.

Accident Insurance: *see* INSURANCE.

Accidents. The death toll from accidents in the United States in 1954 was 90,000. There were 9,050,000 nonfatal injuries, about 320,000 of which resulted in some form of permanent disability. Information available through Aug. 1955 indicated that the 1955 accidental death toll would be higher than in 1954.

The annual accidental death toll in recent years has been exceeded only by deaths from heart disease, cancer and vascular lesions of the central nervous system. However, a study by the American Medical association revealed that accidents rob the nation of more working years than any disease. The reason is that most accident victims are struck down before or during their productive life, while disease deaths occur when the working years are largely past.

The 43rd National Safety congress, held in Chicago, Ill., in Oct. 1955, marked 43 years of the organized national safety movement, of which the hub has been the National Safety council and affiliated local safety organizations.

Safety work is carried on continuously by progressive industries and by a large number of organizations, both governmental and private, operating in their particular fields of activity, such as industry, street traffic, school, home and farm.

Serving as a clearinghouse for all accident prevention activity, the National Safety council attempts to discover the facts of accident occurrence; to devise or help devise engineering, edu-

cational and enforcement measures for prevention; to assist in determining engineering requirements for the safe design, construction and use of machines and equipment; to help formulate model safety legislation; to participate in planning and executing training and educational programs; to disseminate information widely to interested groups and to the general public, and to encourage and assist the establishment and functioning of community and state safety organizations. The council operates under a federal charter.

Work Safety.—At the end of the first eight months of 1955 the occupational death toll was virtually unchanged from 1954. Deaths of this type in 1954 totaled 14,000.

Most progressive industries were engaged in vigorous safety efforts in 1955. Many of them carried their activities beyond the plant gates, both as a community obligation and because they realized that off-the-job accidents seriously disrupt in-plant operations.

Associations and other employer groups emphasized accident prevention programs in their service to members, and this was proving to be one of the most effective ways to reach the small business. Since at least 70% of the businesses with 100 employees or less were not being reached by organized safety programs, more energetic efforts were being directed to this field where the greatest hope for further substantial reductions of the occupational accident toll lay.

Labour organizations and governmental agencies, such as state and national labour departments, also were making important contributions in the war on accidents.

Traffic Safety.—During the first eight months of 1955, there were 23,470 motor vehicle deaths in the United States, an increase of 5% over the comparable period of 1954. On a mileage basis the traffic accident picture was much more favorable.

PEDESTRIAN CROSSING STRIPES of both parallel and diagonal patterns at the intersection of Seventh Ave. and 42nd St., New York city. The parallel type was deemed more effective and adopted for general use in the city in 1955

Mileage was up about 7%, resulting in a mileage death rate (deaths per 100,000,000 mi.) of about 5.8—a record low for the period.

The tremendous growth of motor vehicle ownership and travel since World War II gave rise to an accident problem which taxed the existing facilities to cope with it. In Dec. 1954 the president of the United States gave the support of the highest office in the land to S-D (Safe-Driving) day in an effort to prove that a co-ordinated effort for 24 hours could achieve a dramatic reduction in deaths. The decline in deaths achieved on the one day would have amounted to about 6,000 if applied to the entire year. Another S-D day was held on Dec. 1, 1955.

In the 1954 National Traffic Safety contest, Washington won the grand award among states. Other states which won first place in their divisions were: Connecticut among eastern states; Virginia among southern states; Minnesota among midwestern states; and Pennsylvania among the eight largest states, which are grouped separately because of their peculiar traffic problems growing out of large population and mileage.

Wausau, Wis., won the grand award among cities for the second consecutive year. Other cities which won first place in their population groups were: Chicago, Washington, Cincinnati, Denver, Oklahoma City, Phoenix, Ariz., St. Joseph, Mo., and Rocky River, O.

Farm Safety.—Four more states organized state farm safety committees in 1954, bringing to 35 the number of states with functioning farm accident prevention organizations. Fifteen states had full-time farm safety specialists. These committees and individuals worked through many public and private agencies to spread information on the farm accident problem and methods to solve it.

For the twelfth consecutive year, the president of the United States proclaimed a National Farm Safety week, in July 1955, which focused attention on accidents to rural residents.

School and Child Safety.—Accidents rank first as a cause of death to children and young people from 1 to 24 years of age.

Source: National Office of Vital Statistics, except that railroad estimates prior to 1933 are based on data from Interstate Commerce Commission. From 1903 to 1932 the other figures are estimates based on data for states in the official registration area. From 1933 to 1948 (5th revision) the figures are those published by NOVS plus National Safety Council estimates of falls in agricultural accidents and drownings in water transport accidents. 1949 to 1952 figures are NOVS totals. 1948 (6th revision), 1953 and 1954 figures are NSC estimates.

*Includes burns by fire and deaths resulting from conflagration, regardless of nature of injury; also burns by chemicals, steam, hot substances in 1948 (5th revision) and earlier years.

†Includes drownings in water transport accidents.

‡Comparable data not available.

Nevertheless, it is in this age group that the most dramatic reductions in the accidental death rate have been made.

For children under 5 years of age, the accidental death rate in 1955 for all types of accidents was about half the rate at the turn of the century, while the motor vehicle rate alone was nearly one-fourth lower than the 1928-32 average rate, the highest on record. For children 5 to 14 years old the 1954 total rate was 51% less than the 1903-12 average, while the motor vehicle rate was about half the 1923-27 average, the peak for this age group.

Home Safety.—The 1954 death toll in home accidents in the United States was 27,500. The majority of the fatalities were among the very young and the elderly persons. Falls were the chief cause. Estimates for 1955, based on the first eight months, indicated that home fatalities in 1955 would be fewer than in 1954.

There was a growing sentiment in the medical profession to view accident prevention, especially in the field of pediatrics and child care, as an important concern and obligation of physicians. Local and state health departments gave increased attention to accident prevention work, with emphasis on home safety.

Canada.—In Canada there were 8,642 accidental deaths in 1953 (the latest year for which complete figures were available as of late 1955). This was a slight increase in number, but a reduced average of 58.6 deaths per 100,000 population. As in the United States, accidents ranked fourth as a cause of death to

BRITISH VERSION of the automobile safety strap demonstrated in 1955

persons of all ages. Motor vehicle accidents were the most important type in Canada in 1953, causing 3,121, or about 36%, of all accidental deaths. Falls were second with 1,469 deaths. Other leading causes were: drowning, 1,202; burns, 477; railroad, 313 and poison gases, 194. (See also DEATH STATISTICS; DISASTERS.)

(M. E. Hr.)

ACTH: see ALLERGY; ENDOCRINOLOGY.

Aden. British colony and protectorate on south coast of Arabia. Governor in 1955: Sir Tom Hickinbotham.

Colony.—Area: 108 sq.mi., including Perim Island (5 sq.mi.) and Kuria Muria Islands (about 28 sq.mi.). Pop. (1946 census): 80,876; Perim 2,346; Kuria Murias about 2,200; (1955 census) 138,441 (Arabs 75.2%; Indians and Pakistanis 11.4%; Somalis 7.7%).

Language: Arabic; also Indian languages, Somali. Religion: Moslem 91.3%, Hindu 3.5%. Chief towns (pop. 1955): Aden (Crater, etc.) 99,285; Sheikh Othman 29,879. Kuria Murias are administered for Aden by the British Persian Gulf residency.

Protectorate.—Area: 112,000 sq.mi., including Socotra Island 1,400 sq.mi. Language: Arabic. Religion: Moslem.

Western Area.—Audhali, Fadhlī, Haushabi, Lahej (Abdali), Lower Aulaqi, Upper Aulaqi, Lower Yafai, Upper Yafai confederation (sultanates), Dhali (amirate), Beihan (sharifate), Akra, Alawi, Dhubi, Hadhrami, Kuteibi, Maflahi, Mausatta, Shueib (sheikhdoms). Total pop. (1954 est.): 450,000. Headquarters of adviser and British agent: Lahej (pop. about 12,000). Premier chief, western, Ali Abdulkarim, sultan of Lahej; British agent, G. K. N. Trevaskis.

Eastern Area.—Shihr and Mukalla (Qu'aiti), Seiyun (Kathiri), Kishr and Socotra (Mahri), Bir Ali (Wahidi), Balhaf (Wahidi) sultanates; Irka and Haura sheikhdoms. Total pop. (1954 est.): 350,000 (Socotra I. 12,000). Chief towns: Mukalla (port; headquarters of resident adviser and British agent); Saiun; Tamridah (Socotra). Premier chief, eastern, Sir Salih bin Ghalib al-Qu'aiti, sultan of Shihr and Mukalla; British agent in 1955, Col. J. E. H. Boustead.

Kamran (area 22 sq.mi.; pop. about 2,200) is in the Red sea off the Yemen coast. Governor: governor of Aden ex officio; commissioner in 1955, Lieut. Col. R. G. W. E. Alban.

History.—There was a continuation of rebel activity, supported by Yemeni influences across the frontier, in the western protectorate during early 1955. But the situation improved after action by the security forces which were reinforced in July by troops from Great Britain. At the beginning of the year a second unofficial member was added to the colony's executive council, and in July the terms of proposed constitutional changes in the colony were announced after discussion with members of the legislature. They included the holding of elections for four members of the legislative council (there having been no elected members before), of whom three would be chosen by constituencies and one by the Aden municipal council.

(J. J. Ty.)

Certain Moslem associations decided to boycott the elections, claiming inadequate provisions for direct representation. Henry Hopkinson, United Kingdom minister of state for colonial affairs, visited the colony and protectorate in January.

Education.—(1954) *Colony:* Schools: primary 32, pupils 7,233, teachers (1953) 221; secondary (including 1 technical college with 150 students) 14, pupils 2,177, teachers (1953) 15. Teachers' training classes 2, students 19. Aden college provides postsecondary education for men. *Protectorate:* Schools (excluding private): primary 105, pupils 7,062; secondary 6, pupils 524.

Finance and Trade.—Monetary unit: East African shilling, valued in 1955 at 14 cents U.S. Budget (1954–55 est.): revenue £2,319,879; expenditure £2,318,332. Foreign trade (1954): imports £64,900,000; exports £44,300,000. Principal products (1953): salt, 244 metric tons; salted fish.

CHANCELLOR ADENAUER PRAYING in the only Roman Catholic church of Moscow during his visit to the U.S.S.R. in 1955

Adenauer, Konrad (1876–), German lawyer and statesman, was born at Cologne, Jan. 5. He was educated at the Gymnasium St. Aposteln, Cologne, and at the universities of Freiburg im Breisgau, Munich and Bonn. In 1906 he was elected councillor and deputy mayor of Cologne, becoming lord mayor (*Oberbürgermeister*) in 1917. A leading member of the Catholic Centre party, he was a member of the Prussian *herrenhaus* from 1917 to 1918 and Prussian *staatsrat* from 1918 to 1933 (president, 1928–33). He was dismissed by the nazis from the position of lord mayor in July 1933 and a year later was imprisoned for a short time during a drive against Catholic leaders. He was again imprisoned in 1944 after the attempt on Adolf Hitler's life. The U.S. occupation authorities made him mayor of Cologne in the spring of 1945, but in October the British, who had taken over the area, dismissed him, forbidding him to take part in politics; however, this prohibition was soon removed. A foundation member of the Christian Democratic union in Sept. 1945, he was president (1948–49) of the parliamentary council of the three western zones which drafted the constitution of the German Federal Republic. He became chancellor of the republic on Sept. 15, 1949.

Adenauer's chancellorship was marked by the substantial economic recovery of the republic and by renewed German participation in external politics. Having triumphantly won the general election of Sept. 6, 1953, he remained federal chancellor. By signing in Paris, on Oct. 23, 1954, a series of agreements with the western powers, Adenauer succeeded in restoring German sovereignty, getting the right to rearm and obtaining membership in the North Atlantic Treaty organization (NATO) for the German Federal Republic. However, by signing the Franco-German agreement on the Saar, he made a sacrifice to save western European union.

On May 5, 1955, at Bonn, he presided over the ceremony of the formal attainment of sovereignty by the German Federal Republic. Four days later, in Paris, he attended a meeting of the NATO council at which the German Federal Republic joined the organization as its 15th member. In June he visited the United States, where he received an honorary degree from Harvard university. He also had discussions with Pres. Dwight D. Eisenhower in Washington, D.C., and subsequently met in New York city the foreign ministers of France, the United Kingdom and the United States. On his way back he stopped in Lon-

don and visited Sir Anthony Eden. During Sept. 9-13 he was on an official visit to Moscow and agreed to the Soviet proposal of establishing diplomatic relations between the U.S.S.R. and the German Federal Republic.

Adult Education: *see* EDUCATION; LIBRARIES.

Advertising. Advertising expenditures in the United States in 1955 kept pace with the growth of business. It was possible that total advertising volume would reach \$9,000,000,000, as it was increasing at the rate of more than 10% over the approximately \$8,200,000,000 spent in 1954.

A comparison between the growth of advertising since 1935 and the increase in the gross national product showed that each had increased approximately 400%. Moreover, since 1935 the relationship of advertising expenditures to gross national product had remained practically constant, standing at 2.3% in 1935 and 2.2% in 1954.

The Magazine Advertising bureau, in releasing at midyear data on national advertising since 1939, indicated that there had been a tremendous increase in such advertising both in terms of dollar investments and the number of companies using one or more national advertising media. In dollar totals, advertising volume increased from \$333,000,000 to \$1,429,000,000 in 1954, and the total number of advertisers rose from 936 in 1939 to 2,615 in 1954. There was also an increase of about 300% since before World War II in the number of nationally advertised brands, this contributing to the growing importance of advertising.

For the first seven months of 1955 national advertising expenditures were \$705,087,357 for space in general and farm magazines and newspaper sections, and for time on radio and television networks. This compared with \$631,532,761 for the like period in 1954, a rise of almost 12%.

Gains were made in almost all industrial classifications. The largest category, foods, accounted for advertising expenditures of \$114,678,669, compared with \$102,174,884 in 1953.

Advertising Agencies.—There was a marked restlessness among accounts of advertising agencies during the year, resulting in many shifts that sometimes ended long relationships. For example, the Coca-Cola company decided to leave the D'Arcy Advertising company after an association of 49 years, and gave its business to McCann-Erickson, Inc. The business involved direct billings in excess of \$10,000,000, with about \$5,000,000 more in co-operative advertising. There were many other shifts, involving liquor, watch, floor covering, soup, chemical and other accounts, and terminating relationships of up to 40 years. It was believed by students of the agency business that these

Table I.—Leading Advertising Agencies in 1954

Agency	Billing	Agency	Billing
J. Walter Thompson Co. . .	\$103,575,367	Foote, Cone & Belding, Inc. . .	\$42,361,111
Young & Rubicam, Inc. . .	99,447,762	William Esty Co., Inc.	40,990,000
Batten, Barton Durstine & Osborn, Inc.	90,698,001	Benton & Bowles, Inc.	39,250,000
McCann-Erickson, Inc. . . .	53,388,712	Leo Burnett Co.	34,876,000
		N. W. Ayer & Son, Inc. . . .	34,665,000

shifts were caused by upheavals in industry, resulting in new methods of distribution; the management of advertising firms by committee, a more difficult basis of stable agency-client relationships; deaths of pioneers in industries who had remained loyal during their lives to the agencies with which they had been associated; shifting in leadership among brands; and failures among agencies in replacing and training capable personnel.

A measurement of actual expenditures for space and time made during 1954 in national advertising in newspapers, magazines and radio and television broadcast advertising is shown in Table I. The figures representing their billings were for national advertising placed by clients spending \$25,000 or more in at least one of the four media classifications.

Agencies were beginning to see business opportunities in the development of atomic energy, and at least five were giving special attention to this field.

Television and Radio.—Data provided by the bureau of the census as a part of the current population survey showed that 32,106,000 households had television sets, or 67.2% of the 47,888,000 households in the U.S. Of the households with television 96.5% owned one set and 3.5% owned more than one set.

Data supplied by the Publishers Information bureau showed that television network advertising totalled \$227,172,548 in the first seven months of 1955, compared with \$173,797,990 in the comparable period of 1954. Biggest increases were in the classifications of foods and toiletries. During the same periods television advertising expenditures on network radio were dropping to \$60,548,735 from \$84,093,760. The automotive and smoking classifications remained relatively constant in this medium, however.

Colour television did not make such fast progress as had been hoped. However, its promoters declared that by 1965 all television sets manufactured would be equipped to receive colour and that 65,000,000 sets would be in operation, more than half equipped for colour. They said that lack of colour programming and sponsorship in 1955 was caused chiefly by the lack of colour receivers. It was estimated that about 7,500,000 television receiving sets of all kinds and 12,000,000 radio sets would be sold in 1955.

The subject of paid versus free television was debated warmly during the year. Paid or toll television is that proposed by certain interests to be supplied to television set owners for a fee, perhaps as much as \$2.50 a week, such programs to be without commercials. The main proponents of pay television were manufacturers of devices to be used in such systems, while the opponents included the television networks and the National Association of Radio and Television Broadcasters. Arguments were presented before the Federal Communications commission, with the commission inviting the public to comment by mail. More than thousands of messages were received. No decision was expected from the commission before the end of the year. Meanwhile surveys taken by three research firms showed that television commercials were generally well received by the public.

Newspapers.—The Bureau of Advertising, American Newspaper Publishers association, declared in midyear that national newspaper advertising was running at the rate of \$650,000,000 a year, and that for the first seven months of 1955 it showed a 9.9% gain over the similar 1954 period.

The 10 largest advertisers in newspapers in 1954 were announced by the Bureau of Advertising as shown in Table II, the expenditures noted excluding co-operative advertising.

DOLLAR EXPENDITURE for all mediums of U.S. advertising, 1935-55. The figure for 1955 is an estimate. (Source: *Printers' Ink*)

NEWSPAPER ADVERTISEMENT announcing the 1955 merger of two New York city banks

Newsprint consumption in the United States remained at an all-time high, the newspapers reporting to the American Newspaper Publishers association using 384,679 tons in August, a rise of 6.6% over the same month in 1954. The amount for the first eight months was 3,360,187 tons, up 7.6% over the comparable 1954 period. Prospective rises in the cost of newsprint alarmed publishers, and they warned that such increases might cause some papers to suspend publication.

Magazines.—Expenditures in general and farm magazines as compiled by Publishers Information bureau showed that in the first seven months of 1955 a total of \$360,358,671 was invested, compared with \$336,176,905 in the same period of 1954. Large gains were registered in the foods, automotive and industrial materials classifications. The bureau reported that magazines carried \$550,267,000 of advertising in 1954.

Magazines in 1955 continued to make substantial gains in circulation, often accompanying the reports of these gains with new rate cards announcing higher advertising rates. The *Saturday Evening Post*, *Sports Illustrated*, *Fortune*, *Christian Herald*, *McCall's*, *Esquire*, *Reader's Digest International Editions* were among many that raised rates. *Look* sought to level the peaks and valleys in its advertising volume by instituting an advertising rate structure that allowed discounts for continuous use of full-page advertisements or their equivalent in half pages, the space to be used in 26 consecutive issues of this biweekly publication.

A study conducted by Alfred Politz Research, Inc., showed that readership of consumer magazines was almost three times as great in homes that had television as in those without it.

In what was called by Curtis Publishing company "the most notable change in magazine ownership in recent years," that company sold its *Country Gentleman-Better Farming* to *Farm Journal*. The former publication had 2,566,314 circulation, going back 102 years. The latter had 2,870,380 circulation.

Other Media.—Donald C. McGraw, president of the McGraw-Hill Publishing company, told the Associated Business publications that the current advertising volume of \$372,000,000 in business publications should increase to \$515,000,000 by 1965. He warned against complacency over past successes.

A new weekly magazine, *Petroleum Week*, was launched, and a magazine with controlled circulation, *Package Engineering*, was announced for publication in Jan. 1956. Many business publications announced increases in circulation and advertising rates.

Direct mail volume for the first five months of 1955 passed the \$500,000,000 mark, according to the Direct Mail Advertising association. This represented a gain of 3.5% over the same

period of the year before.

Legal Aspects.—Government took an increasing interest in advertising during the year. The antitrust division of the department of justice charged conspiracy and collusion in restraint of trade and in violation of the Sherman act against several advertising groups, including the American Association of Advertising agencies, the American Newspaper Publishers association, Associated Business publications, Periodical Publishers association, Agricultural Publishers association and Publishers Association of New York. Court appearances to answer the government's complaint were postponed various times following the filing of the complaint in May.

The Federal Trade commission announced that it would try to block the merger of *Farm Journal* and *Country Gentleman-Better Farming*, alleging that the merger "eliminated the only competitor with national advertising and circulation in the monthly farm magazine field."

The commission issued guides for advertisers that banned cigarette advertising which claimed smoking cigarettes had medical approval, or which made reference to effect of smoking on nose, throat, nerves or any other part of the body.

Advertising in Other Countries.—Commercial advertising on television made its debut in Great Britain on Sept. 22. Britons got their first look in a four-hour telecast by the new London station of the independent television authority. The commercial plugs were much milder than those used in the United States, as well as briefer, the maximum time for advertising on a one-hour program being six minutes. It was not expected that television would cause a major shift in the allocation of advertising expenditures among other media.

Advertising in Canada remained vigorous. Government data issued at midyear showed that advertising agencies numbered 91, having increased by three in 1954. The volume of business handled by them amounted to \$156,163,289, a rise of \$11,823,981 over the figure for 1953. The number of employees increased by 10% to 3,173 and their compensation to \$15,220,278 from \$13,630,975. Payrolls took 61.9% of gross revenue. Percentage of distribution of commissionable billings by media in 1954 was as follows: publications, 56.4%; other visual, 4.5%; production, art work, printing, etc., 17.3%; radio, 15.4%; television, 5.5%; other, 0.9%.

Aeronautics: see AVIATION, CIVIL; AVIATION, MILITARY.

Afghanistan. An independent kingdom in central Asia, Afghanistan is bounded north by the U.S.S.R., west by Iran, south and southeast by Pakistan and east by China. Area: about 251,000 sq.mi. Pop. (1953 est., no census ever taken): 13,000,000. Races: Pashtu or Pakhtu 60%, Tajik 30.7%, Uzbek 5%, Hazara (Mongoloid) 3%. Languages: Pashtu and Persian. Religion: Sunni (Hanafi) Moslem. Chief towns (pop., 1953 est.): Kabul (cap.) 310,000; Kandahar 195,000; Herat 150,000; Mazar-i-Sharif 100,000. King, Mohammed Zahir Shah; prime minister in 1955, Mohammed Daud Khan.

History.—Pakistan-Afghan relations in 1955 remained marred by the continued support given by the Kabul government to the Pashtu (or Pakhtu) people of the former North-West Frontier province of Pakistan in their so-called demand for self-determination. The Kabul government does not recognize the 1893 Durand line as the Afghan-Pakistani international frontier.

On March 29 the prime minister broadcast a speech over Kabul radio which amounted to open incitement of the Afghan people against Pakistan. This speech was followed in the course

of the next two days by demonstrations in Kabul, Kandahar and Jalalabad during which Pakistani missions were wrecked and looted and Pakistani flags were pulled down. The government of Pakistan was, therefore, compelled to close its diplomatic and consular missions and withdraw their staffs. A "general mobilization" of Afghan armed forces was ordered in Kabul at the beginning of May, in reply to which Gen. Mohammed Ayub Khan, Pakistani minister of defense and commander in chief, commented that if any inroads were made into Pakistan territory Afghanistan would be taught a lesson to be remembered for life. Attik Khan Rafik, Afghan minister to Karachi, was recalled to Kabul. Mikhail V. Degtyar, Soviet ambassador to Kabul, was reported to have promised Afghanistan "total military aid" in the event of Pakistani aggression. This acute tension resulted in offers of mediation by Islamic powers, but Gen. Iskander Mirza, then the Pakistani minister of the interior, made it clear that his country would maintain the Durand line. On June 30, when opening the session of the Afghan national assembly, King Zahir pledged his country's support for the idea of an autonomous Pashtunistan.

On Sept. 13 the Afghan foreign minister, Mohammed Naim Khan, rehoisted the Pakistan flag on the Pakistani embassy in Kabul with full ceremonial honours and in the presence of Col. A. S. B. Shah, the Pakistani ambassador. Chaudhri Mohammed Ali, the Pakistani premier, said on Sept. 15, in the constituent assembly, that relations between the two countries had taken a turn for the better. This improvement, however, did not continue for long. When, on Sept. 30, the Pakistani constituent assembly passed a bill merging western Pakistan into a single province, the Afghan government protested against this violation of the rights and wishes of the Pashtu people. Attik Khan Rafik was again recalled from Karachi (October).

At the beginning of November a few thousand armed Afghan tribesmen entered Pakistan along a 100-mi. stretch of frontier about 300 mi. N.E. of Quetta. A Pakistani army spokesman said that militarily there was no threat in the presence of these tribesmen. He added, however, that there was evidence that this so-called invasion was inspired by Kabul with the moral and material support of the U.S.S.R. and India. The Afghan ambassador to Cairo, Salaheddin Salgooky, declared that his country would seek Soviet or Czechoslovak arms if the west failed to supply them.

Education.—Schools (1951): primary 334, pupils 100,250 (including about 500 girls); secondary, lower 25, higher 7; vocational 2. Teacher training colleges 2. University of Kabul, with six faculties.

Finance.—Monetary unit: afghani, with an exchange rate of 16.80 afghanis to the U.S. dollar. Budget (1953 est.): total revenue 345,000,000 afghanis (consisting largely of payments in kind). Note circulation (1953): 1,278,000,000 afghanis.

Foreign Trade.—(1954) Exports to the U.K. £826,000; imports £303,000. Principal imports: cigarettes (5,000,000 in 1952), sugar, cloth, cement, building materials and motorcars. Principal exports: karakul skins (Persian lamb) (5,600,000 in 1952), carpets (150,000 m. in 1952), raisins, wool, fresh fruit, tobacco, spices, hides and skins.

Transport and Communications.—Roads (1949): 3,624 km. Motor vehicles in use (1952): cars 840, commercial 2,500. Telephones (Jan. 1954): 5,822. Radio receiving sets (1950): 8,000.

Agriculture.—Main crops (metric tons, 1953; 1954 in parentheses): cottonseed 26,000 (22,000); cotton, lint 13,000 (11,000); beet sugar, raw 6,000 (6,000); cotton, ginned 13,000; wheat (1948) 1,700,000; rice (1948) 333,000; barley, millet and maize. Livestock (1948): horses 500,000; asses 1,000,000; mules 200,000; cattle 2,500,000; sheep 14,000,000; goats 6,000,000; camels 350,000; chickens 40,000,000. Wool production (clean basis, 1954): 3,000 metric tons. Fuel and power (1951): electricity 17,000,000 kw.hr.

Agricultural Research Service. This agency conducts all of the U.S. department of agriculture's production and utilization research (except forestry research) and crops and livestock regulatory programs. Much of the work is co-operative with other federal, state or private agencies.

Antibiotics, already widely useful in combating animal diseases, hold promise of controlling some fungous as well as many bacterial diseases of plants. In the course of research which was continuing in 1955, they proved effective experimentally in varying degrees, against such bacterial diseases as leaf spot of sesame, angular leaf spot of cucumber, bacterial spot of pepper, wetwood of trees and rot of giant cactus. Antibiotics also proved effective against certain fungous diseases, such as bean rust and downy mildew of lima beans.

A discovery that fungi, which contain no chlorophyll, respond to light may mean that they can serve even better than green plants as tools for studying plant reactions to light.

Growth-regulating chemicals, which in lethal dosages clear lands of weeds and unwanted brush, continued to show amazing diversity in constructive use on crop plants. Low dosage application of 2,4,5-T produced lima bean plants $2\frac{1}{2}$ times the size of unsprayed ones, and increased yields of fresh beans 200 to 300 lb. per acre. Sprays of this chemical increased size, advanced maturity and prevented fruit drop of apricots. A chemical spray caused foul-smelling fruit of the ornamental ginkgo tree to fall off. A new sprout inhibitor proved highly effective for storing Irish potato tubers.

Improved crop varieties recently developed included a long grain rice variety; oat varieties resistant to all known races of oat stem rust; a superior winter barley; a superior dryland stripper cotton; a blight-resistant cotton; a hybrid disease-resistant spinach; four new durum wheat varieties resistant to 15B as well as other common races of wheat stem rust; a hard resistant orchard grass; two nonshattering sesame varieties; an early-maturing, shatter-resistant castor bean; an early, resistant onion; a superior Zoysia hybrid lawn grass; a disease-resistant sugar beet; and a wildfire-resistant burley tobacco. In the spring of 1956, hybrid grain sorghum seed would, for the first time, be available to growers. Its potential yields were 20% to 40% more than currently used varieties. Sorghum and Johnson grass were being crossed to develop a new perennial forage crop for the south.

Screwworms, costly livestock pests, were eradicated from the Caribbean island of Curaçao by a completely new method of biological control. Male flies, made sterile by radioactive rays, were released over the island to mate with wild female flies. It was hoped that this experiment might provide a method for eventually eradicating this livestock pest from Florida.

Free-choice phenothiazine, properly employed, appeared to present an entirely new approach to cattle-grub control; it might also be the most powerful weapon available for combating losses from parasitism in cattle.

A mite so small it cannot be seen without a microscope was identified as the carrier of peach mosaic, destructive virus disease of stone fruits.

A federal quarantine against the European chafer, a serious agricultural pest first recognized in the United States in 1919, went into effect to guard against spread of the insect from infested areas of Connecticut, New York and West Virginia.

A co-operative federal-state program to control the burrowing nematode that causes spreading decline of citrus began in Florida.

Probably the largest building-fumigation job in history is under way in California, Arizona and New Mexico against the grain-infesting khapra beetle, first found in the U.S. in 19

Grain storage buildings were wrapped in gastight covers and fumigated with methyl bromide gas to destroy the hard-to-kill insect.

About 18,500 destructive plant pests—11,500 insects and 7,000 plant diseases—from throughout the world were intercepted by plant quarantine inspectors during fiscal year 1955. They were found with agricultural products in cargo, in stores, baggage and mail, and as stowaways aboard vessels, planes, railway cars and vehicles.

More efficient mechanical means of producing and processing crops are constantly being developed, adapted or improved. Recent developments included an improved, inexpensive hose pump for metering liquid fertilizer; a mechanical silage feeder that reduced hand labour and cut by two-thirds time spent in feeding animals; two devices for tipping beehives that considerably reduced hand labour required for handling hives; a method of mechanical harvesting and curing of Virginia-type peanuts that saved labour and materials; fertilizer placement machines; a mechanical tung nut harvester; a sugar beet thinner using counter-rotating heads; and equipment for cutting leaves of and transplanting sansevieria, a long-fibre crop.

A combined opener and cleaner for cotton was developed, which could replace the four or five machines now needed. A new cotton-planting attachment for use with lister planters in the southwest was expected ultimately to save \$6,000,000 to \$10,000,000 annually in cost of replantings.

Use of radioactive chemicals as research tools continued to aid in solving problems of soil and plant relationships. Soil scientists had learned to measure available phosphate in any soil so accurately that it could be expressed in terms of pounds of superphosphate-equivalent per acre. By using a radioactive isotope of sulphur as a tracer, they found that cotton plants absorb part of their sulphur requirements from the atmosphere as sulphur dioxide. Adding iron chelates to the soil makes iron available for use of some western iron-hungry plants.

The total value of farm assets—farms, livestock, machinery, crop inventories, household goods, bank deposits and other financial assets owned by farmers in the United States—was about \$163,000,000,000 at the beginning of 1955, 1% above a year earlier but about 4% below the peak of 1952. Total farm debts rose nearly \$1,000,000,000 in 1954, from \$17,100,000,000 to \$18,000,000,000. Total farm-mortgage debt increased in 1954 for the ninth consecutive year and at the start of 1955 totalled \$8,200,000,000, 72% above the postwar low in 1946. It continued to rise in 1955. Farm real-estate values rose slightly during the year ended in March 1955; farm sales volume was 5% above the previous year's volume. Taxes on farm real estate increased in 1954 for the 12th consecutive year, pushing the average tax per acre to an all-time high.

Fatty acids usually produced in the rumina of cattle and sheep by other bacteria and used by important fibre-digesting bacteria were recently identified as essential for the latter's growth. It might be possible to add such factors to certain ruminant rations to increase digestion of the animals' feed and thus speed up growth.

One noteworthy gain on the livestock disease front would permit tissue-culture production of foot-and-mouth disease virus for research purposes in the U.S. Other work promised to result in more positive early diagnosis and improved control of vesicular stomatitis and, for the first time, an extensive U.S. survey of anaplasmosis. Ways were found to differentiate vibrios—bacteria—that cause vibriosis in cows from those that do not, and to cut the number of brucellosis-vaccinated animals classified as suspect and increase numbers classified as negative.

Recent swine disease research made practical the diagnosis of atrophic rhinitis, prevention of "yellow fat" disease, check of

spread of vesicular exanthema, and possibly the eradication of hog cholera.

Scientists discovered that resistance to the cancerous poultry disease, visceral lymphomatosis, may be passed to chicks through eggs from vaccinated hens inoculated with massive doses.

Mexico was declared free of foot-and-mouth disease on Dec. 31, 1954, and the border was reopened on Jan. 1, 1955.

Co-operative research and regulatory action was being taken against several apparently new diseases of cattle recently reported from scattered locations throughout the country under such names as viral diarrhoea, mucosal disease and rhinotracheitis. (See also VETERINARY MEDICINE.)

A reference diet for human nutrition studies was developed as a research tool for determining individual needs for practically any important nutrient, except amino acids, and measuring their use by the body.

New food composition tables were issued in which calories for hundreds of individual foods had been calculated from specific factors, replacing general factors developed about 50 years ago. They were especially useful in calculating calories for individual foods, special diets and international food supplies.

Two complex chemicals, discovered in the tubers of a rare Mexican yam, showed promise as superior raw materials for synthesis of the drug cortisone.

Transforming perishable foods into more storable form continued to help adjust marketing to demand. Newly developed were a lemonade powder rich in natural flavour, and tasty new French-fried vegetable snacks—chips from sliced carrots, beets and parsnips, and "nuggets" from whole peas and lima beans.

Dehydrofreezing, a combination food-processing technique which was coming into commercial use, might soon help to place on the market apples, apricots, green peas and pimientos that would combine space and weight economies of dehydration with convenience and freshness-retention of freezing. (See also CHEMISTRY.) (B. T. S.)

Agriculture. U.S. agriculture in 1955 became the widely recognized problem sector of the national economy. In the midst of an over-all boom, the farming sector drifted lower—a long continued slide that by late summer became a major worry to political and administrative officials as well as personally painful to a considerable percentage of farmers and some businessmen. Yet U.S. farms continued highly productive—so productive that abundance mounted to a problem surplus. Thus most U.S. families continued to "eat high on the hog" without, however, much, if any, decline in the dollar cost of their food budget. The farmers' share of the consumers' dollar for farm food products declined to 40% in July as compared with 43% a year earlier. Middlemen and retailers prospered—the widening spread between prices to farmers and to the consumer of this \$64,000,000,000 industry being partly explained by additional services. Changes in consumption patterns involved not only growth in use of frozen foods but eating outside the home—estimated as a \$16,000,000,000 industry.

Agricultural production continued very strong in spite of considerable drought and flood disaster. Farmers voted affirmatively on all marketing quotas and, with the exception of corn, generally abided by acreage allotments. Yet, over-all acreage planted did not decrease significantly. Whereas it had been assumed by most economists and technicians that the rapid domestic population increase would soon wipe out the agricultural surplus, the year brought larger stockpiles and higher costs of carrying the reserves in spite of major export efforts.

In spite of official acreage controls on a few crops, plantings were about as large in 1955 as in 1954. However, early bumper prospects were somewhat blasted in August; drought in the

western corn belt reduced corn prospects as much as 10% during that month and the record crops of soybeans and grain sorghums also suffered serious reduction. Drought in the middle Atlantic area, hurricane and related flood damage in parts of the east and extreme temperatures in California were part of the 1955 pattern.

After earlier indications which suggested to some a period of general stability, prices received by farmers declined 4% between mid-June and mid-August to a level about 6% below a year earlier, then declined further in the autumn. For the first eight months of 1955, as compared with the same period of 1954, prices received were about 5% lower, volume of marketings 1% larger, and cash received \$16,700,000,000, about 4% less. Farm debts increased. Meanwhile, the farmers' costs of production were comparatively stable near their all-time peak.

Though world food production expanded little in 1955, the one-fourth expansion in the past decade provided an eased situation in many areas, burdensome surplus in a few. Famine from drought, flood or economic dislocation was rarely noted. Trade in agricultural products declined somewhat as more areas attained, or tried for, self-sufficiency.

Crop Production.—U.S. crop production in 1955 was indicated at 106% of the 1947-49 base, equal to the 1948 record. On a yield per acre basis, the preliminary index was 117, well above the 1948 record of 108. Overwinter crops and early spring plantings were bedeviled by a dry, cool spring plus a severe late March freeze which extended deep into the early vegetable producing areas of the south. Not until late May did general rains drench the emerging dust bowl of the southern plains,

Table I.—U.S. Production and Yield Per Acre

Field Crops	1955*		1954	
	Yield	Production in thousands	Yield	Production in thousands
Corn, bu.	38.6	3,117,739	37.1	2,964,600
Wheat, bu.	19.3	915,528	18.1	969,700

*Indicated figures.

just in time to rescue partially millions of acres of winter wheat from the edge of disaster and to encourage the planting of feed crops, especially grain sorghums, on acreage which had been sown to wheat but already abandoned for harvest.

The heavy plantings of spring crops intended by farmers in March materialized. Farmers generally abided by the acreage allocations officially set for several major crops, excepting corn on which there was no marketing quota. Nevertheless, for the major crops covered in the March report, intended plantings were 285,500,000 ac., or about 3,200,000 ac. more than in 1954. About 353,000,000 ac. were planted to 59 principal crops for harvest in 1955, only about 1,000,000 ac. less than in 1954.

Food grain crops totalling only about four-fifths as much as the postwar "normal" were harvested from 11% fewer acres than in 1954, partly a result of compliance with acreage allotments, but also involving abandonment of 10,000,000 ac. because of drought and wind damage to winter wheat in the southern plains. The spring wheat crops, including 14,379,000 bu. of durum, were sharply higher than in 1954. Included were 915,528,000 bu. of wheat, 28,448,000 bu. of rye, 5,023,300,000 lb. of rice, and a small buckwheat crop.

Feed grains, in total one-eighth above average and 6% more than in 1954, included a record crop of oats (1,636,030,000 bu.), near record crops of barley and grain sorghums, plus the fifth largest corn crop which was about 150,000,000 bu. larger than the 1954 crop. All told, though the indicated feed grain tonnage declined 8% in August, the new production of 130,000,000 tons (second only to 1948) plus a record carry-over of about 40,000,000 tons (three-fourths of which was controlled by the Commodity Credit Corporation) appeared likely to result in increased carry-over at the end of the 1955-56 crop year, most of it under loan or owned by the CCC. The hay crop was a record one, about 5% larger than that of 1954.

Soybeans on a record planted acreage gave an indicated new record crop of 374,816,000 bu., in spite of a sharp decline in prospect from August drought. The peanut crop was two-thirds larger than in 1954. White potatoes, though slightly below average, were nevertheless 9% in excess of 1954 and so abundant as to call for a large diversion program. The tree nut crop was small. Deciduous fruits, more abundant than in 1954, were nevertheless average—the early peach crop a near-failure, but grapes about one-fifth more abundant than the previous year. Citrus fruits were abundant.

In spite of an official reduction of 14% in cotton acreage, new record high yields provided an abundant crop larger than in 1954 or average. Vegetable crops generally were about average. The tobacco crop was indicated as slightly larger than

TOWNSPEOPLE OF KRASNODAR, U.S.S.R., welcoming the U.S. farm delegation in Aug. 1955

in 1954 and substantially above average, hence likely to raise problems of further acreage reduction. Sugar crops in total were less abundant than in 1954.

Livestock Production.—The weighted index of total numbers of livestock and poultry on U.S. farms at the beginning of 1955 was 112 as compared with 109 in Jan. 1954 and 100 as an average for 1947-49. Thus an upward trend in evidence since 1949 and only briefly interrupted in 1953 was resumed. Meat animals were 114% of the 1947-49 average, up 2% in the year. Milk cattle and poultry approximated the 1947-49 average. Cattle and calves, numbering 95,433,000 head, were a new record high, the sixth successive year of increase and 646,000 more than a year earlier. The size of the cattle breeding herd was practically stabilized, an increase in beef cows compensating for a slight decline in milk cows.

All sheep and lambs on farms declined to 30,931,000 from 31,218,000 a year earlier. Ewes in flocks and lambs on feed declined, but ewe lambs increased by 9%, suggesting probable moderate growth in flocks in near years, activated perhaps by a new rather favourable government support program for wool.

Hog numbers on Jan. 1, 1955—55,002,000 as compared with 48,560,000 head a year earlier—were substantially increased by a large spring pig crop of 60,503,000 saved, 9% more than in 1954, and by expanded breeding of sows to farrow in the autumn of 1955. This provided over-all for a pork supply about 10% larger than in the previous year. Still further expansion was indicated for the spring of 1956, the large supply and lower price of corn more or less compensating for lower hog prices.

The corn-hog price ratio, standing at 12.7 in October, or the same as in October 1954, was not so favourable as in recent years but sufficiently favourable to encourage expansion.

The 447,310,000 chickens on farms at the beginning of the year, as compared with 442,813,000 a year earlier, included 397,000,000 layers. By preliminary estimate, only 524,400,000 chickens were raised on farms in 1955 as compared with 620,300,000 in 1954. This 15% total reduction resulted in 7% reduction as compared with 1954 in pullets not yet laying on Sept. 1, a fact likely to reduce number of layers and, perhaps, egg production in 1956. Broiler placements, of record high levels in June and July, continued later in the year at a level about 10% above 1954. From 2,851,000 breeder turkeys on farms Jan. 1, there were 63,100,000 turkeys raised as compared with 65,900,000 in 1954. Heavy breeds totalled about 47,000,000 in both years, the decline occurring in the light breeds.

Production of all meat in 1955 was about 26,875,000,000 lb., 6% more than the 1954 record. Though pork accounted for much of the increase, fed cattle increased by at least 10% in the beef component, providing an abundance of high quality beef. Consumption of red meats per person was about 160 lb., exceeded only by the 163 lb. of 1908. Beef consumption of 81 lb.

Table II.—Index Numbers of U.S. Farm Output, Gross Production of Livestock and Crops, by Major Groups (1947-49=100)

Item	Indicated 1955	1954	Average 1952-54
Farm Output	111	108	108
All livestock and products	120	119	115
Meat animals	122	119	116
Dairy products	108	108	105

SOVIET FARMER Aleksandr Ezhaviski sampling U.S. watermelon at Iowa Falls, Ia., in Aug. 1955

exceeded the 1954 record high of 79 lb. per person. Shorn wool production was estimated at 228,000,000 lb., grease basis, 2% less than in 1954.

Though milk cows were reduced and milk production in the early part of the year was slightly below the early part of 1954, production for the year somewhat exceeded the 123,500,000,000 lb. of 1954. The rate of egg lay per hen was much increased in 1955 over 1954, reaching a new record level.

Agricultural Stocks and Foreign Trade.—In spite of a major and rather successful effort to export agricultural products in 1955, the build-up of some types of surpluses, or reserves, continued. Carry-over wheat stocks of 1,020,000,000 bu. on July 1 were 13% larger than the previous record in 1954. The corn carry-over on Oct. 1 was a record 1,050,000,000 bu., as compared with 920,000,000 bu. a year earlier. The cotton carry-over on Aug. 1 was 11,100,000 bales, about 1,400,000 bales more than in 1954.

A considerable part of the large reserve was in government-held stocks. At the end of July, government holdings and commitments amounted to \$7,019,823,000, down for the fifth consecutive month from a peak of \$7,440,156,000 reached at the end of Feb. 1955, but far above the \$5,980,269,000 of July 1954. Of the total, \$4,925,484,000 was held outright and \$2,085,339,000 under loan. Major items in the government-held surplus were: wheat, \$2,600,000,000; corn, \$1,400,000,000; cotton, \$1,400,000,000; tobacco, \$400,000,000; and dairy products, \$350,000,000. It appeared that with the completion of major 1955 harvests, large amounts of several products would come under government price support, to increase the total of surplus stocks.

U.S. agricultural exports increased modestly in 1954-55, whereas total exports of the U.S. economy declined. For the 12 months ending June 30, 1955, agricultural exports were valued at \$3,142,842,000 as compared with \$2,935,905,000 for the preceding year. Grains and their products were as usual the leading

group, accounting for \$826,271,000 as compared with \$855,115,000 in 1953-54. Cotton, excluding linters, valued at \$684,288,000, showed a slight increase for the year. A large miscellaneous "other" increased to \$480,523,000 from \$363,115,000 in the previous year. Leaf tobacco increased slightly to \$305,139,000. Fats and oils, including oilseeds, increased sharply to \$457,841,000 from \$363,285,000 in the previous year. Wheat exports increased 60,000,000 bu. to 275,000,000 bu. for the year. About 30% of the total value of farm products exported was facilitated by some type of government financing, as compared with 24% in 1953-54 and 19% in 1952-53. Some products were sold at "competitive" world prices, as much as one-fourth lower than those prevailing in the U.S.

Agricultural imports for consumption declined in 1954-55 to \$3,786,542,000, as compared with \$4,175,891,000 in 1953-54. This was largely accounted for by the decline of one item, coffee, to \$1,268,514,000 from \$1,620,598,000 in the preceding year. Crude rubber (\$351,201,000) and bananas (\$231,780,000) both showed substantial increase in value. Among the supplementary products, which accounted for \$1,515,190,000 of the total imports as against \$1,693,759,000 in 1953-54, cane sugar was the leader at \$382,191,000, down from \$437,865,000 in 1953-54. Wool and meats, each at nearly \$150,000,000, were next in value, but below the previous year.

Farm Product Prices.—The feature of the year was not so much that prices declined but that they declined a further 6%, much of that rather precipitously in July and August, after having been regarded as fairly well stabilized. A modest upturn in September appeared not to change the trend. The index of prices received by farmers stood at 235 (1909-14=100) in September, down from 246 in Sept. 1954, and far below the all-time high of 313 in Feb. 1951.

Meanwhile, the farmers' share of the consumer's dollar for farm food products declined to 40 cents as compared with an average of 43 cents for all of 1954 and as much as 52 cents in 1946. However, the consumer price index was almost stable at about 115% (1947-49=100), with a slight decline in food costs to the lowest level since 1950, compensating for higher costs of some other cost-of-living items.

Farm Income.—During the first eight months of 1955 farmers marketed a total product volume about 1% larger than in the previous year. Prices, however, were about 5% lower and the \$16,700,000,000 received was 4% less than for the same months of 1954. Livestock and livestock products accounted for \$10,400,000,000, 6% less than in 1954; meat animals showed an 11% decline. Cash received for eggs and poultry was little changed, and receipts from dairy products were up about 1%. Cash received for crops marketed during the first two-thirds of the year totalled \$6,300,000,000, a 1% decline on a 2% reduction in volume as compared with the same period of 1954.

Prices paid by farmers for commodities, interest, taxes and wages involved in farm production (the Parity Index) stood at 280 (1910-14=100) in October, as compared with 279 in Oct. 1954 and a record high of 290 in May 1952. Only feedstuffs, a farm-produced item which enters into the index in an important way, showed a major decline.

The result was that the parity ratio (of prices received to costs sustained) declined as low as 82 in October, as compared with 87 one year earlier and a record high of 123 in Oct. 1946. With the lower price-high cost squeeze still operating on the farm economy, farmers' realized net income during the first half of 1955 was at an annual rate of approximately \$10,600,000,000, as compared with a revised total of \$11,800,000,000 for 1954 and a peak of \$16,774,000,000 in 1947.

Farm Values.—Assets of U.S. agriculture, especially farm real estate, again increased. The estimated total market value

of U.S. farm land and buildings in March was \$91,300,000,000, about \$2,200,000,000 greater than in March 1954 but \$2,400,000,000 short of the March 1952 peak. Largest gains, averaging about 6%, were centred in the corn belt. The strength in farm real estate values was rather surprising in the face of the steady decline in farm commodity prices and farmer incomes.

Liquid assets, larger than farmers' total debts, continued near the \$20,000,000,000 level as in other recent years.

Farm debt increased appreciably: short-term and mortgage debt were both about 10% higher at the middle of 1955 than a year before. For short-term debt this represented a reversal of trend; mortgage debt increased at a more rapid rate than in the previous period.

Farm Labour and Low Income Farm Families.—The height of the 1955 summer harvest found about 9,225,000 persons employed on U.S. farms, almost as many as at the same time in 1954 but about 500,000 less than the 1950-54 average July employment. Of this total, 6,529,000 were family workers. Farm wage rates were generally higher than in 1954, but the composite rate per hour was only 67 cents. The rate per month with house was \$163 and per day with board and room \$5.90. The adjusted index for July 1 was 510 (1910-14=100) as compared with 505 a year earlier.

Low income farm families, which provide a considerable part of the farm labour force, both family and hired, received more attention than usual in 1955. They were defined as the approximately 1,500,000 farm families which had cash incomes under \$1,000 in 1950.

Machinery, Fertilizer and Taxes.—Machinery was used in ever increasing amounts on U.S. farms. Prices paid by farmers edged upward, the index in June standing at 315 (1910-14=100) as compared with 314 a year earlier. But several farm machinery companies raised prices something like 7% on some major types of machinery in the autumn. Breaking sharply from the upward trend of the last several years, sales of general agricultural machinery and tractors from the U.S. to Canada in 1954 fell \$62,500,000 from the 1953 level of \$188,000,000. On the other hand, 1954 export sales of these items to South America rose by \$33,000,000 over the preceding year, to a total of \$64,400,000, thereby offsetting somewhat the sharp Canadian sales slump.

Throughout the other areas of the world, moderate to slight declines were evident, with the exception of Asia where export sales of general agricultural machinery made a slight gain over 1954. In absolute terms, the total dollar volume of export sales of the tractors, parts and accessories group experienced a large decline—\$22,000,000 below the 1953 level of \$300,000,000. Percentage-wise, general agricultural machinery was the hardest hit, falling 9.2% from the \$188,000,000 sales volume of 1953.

NEBRASKA FARMER adjusting sprinkler head on irrigation system. The water became available in 1955 from the Bartley canal, part of the Missouri river basin project of the U.S. bureau of reclamation

Fertilizer use was reported as having been moderately reduced in some areas with the decline in farm income. with one overall estimate of 5% less than in 1954. Prices also were somewhat reduced to an index of 152 (1910-14=100) in September as compared with 155 a year earlier. Price softness for nitrogen fertilizers was indicated with sizable expansion in capacity and considerable shift to liquid types. The situation in potash fertilizers became more competitive, record deliveries having been reported in 1954-55. Some early season prices were moderately reduced to 36 cents per unit of K_2O .

Taxes as a cost of production moved up to 409 (1910-14=100) as compared with 391 a year earlier.

Commodity Credit Corporation.—Price supports extended on 1954 crops through June 30, 1955, totalled \$2,943,000,000, about one-third less than on the crops of the previous year, but approximately the same as was extended on 1952 crops. Of the total figure, loans made on 1954 crops amounted to \$2,372,597,069, purchase agreements entered into were \$273,080,000 and purchases of commodities not under agreement amounted to \$297,252,413. Cotton, corn and wheat loans, and purchases of dairy products were less than in the previous year but loans on tobacco, barley, grain sorghums, oats and rice increased.

The total invested in price support commodities as of June 30, 1955, was \$7,069,277,000 as compared with \$6,005,511,000 a year earlier; that in spite of the fact that much surplus had been sold, including, as of June 30, \$463,300,000 sold for foreign currency under public law 480.

The net realized program loss on price support operations for the fiscal year 1954-55 totalled \$799,061,464 as compared with \$416,477,074 for the previous year. Other program operations brought the realized loss to \$849,352,286. Valuation reserves were increased by \$1,384,588,782. As of the end of the fiscal year the Commodity Credit corporation had used \$8,594,634,000 of the \$10,000,000,000 borrowing authority authorized. This in August was increased to \$12,000,000,000, but in the early months of the 1955-56 fiscal year requests for new loans and purchase agreements lagged as compared with the previous year, suggesting that the maximum authorization might not be under serious strain during the current year. On the other hand, it appeared that loss on inventories would probably increase.

Legislation and Administration.—The first session of the 84th congress did not legislate a major new farm program but patched and improved existing measures. The house of representatives passed H.R. 12, which would have restored a fixed 90% of parity support prices on the six basic commodities, by a

close vote, but the senate delayed full consideration until early 1956, after extensive autumn hearings in the farm country.

New legislation included the following items, among others, as briefly noted: Direction to redetermine the national marketing quota for burley tobacco for the 1955-56 crop; one-half acre, rather than the previous seven-tenths acre, was established as a new minimum acreage allotment (public law 21). The excess marketing penalty was increased from 50% to 75% of the average market price in the preceding year. Durum wheat acreage allotments and marketing quotas for farms in the northern plains were increased for the 1955 crop (P.L. 8). The national rice acreage allotment for the 1956 crop may not be less than 85% of the final allotment for the preceding crop (P.L. 288). The requirement that producers comply with acreage allotments in order to be eligible to receive agricultural conservation payments was repealed (P.L. 42). The program for importing Mexican farm labour was extended until June 30, 1959 (P.L. 319). Onions were made subject to futures trading regulations under the Commodity Exchange act (P.L. 174). A bill, H.R. 5188, prohibiting the department of agriculture from forecasting apple prices, was passed by Congress but vetoed by the president. Innocent purchasers of converted fungible goods belonging to the Commodity Credit corporation were relieved from claims by the CCC (P.L. 43).

The Agricultural Trade Development and Assistance act of 1954 was amended to increase to \$1,500,000,000 the limitation on sales for foreign currencies (P.L. 387). The borrowing power of the Commodity Credit corporation was increased from \$10,000,000,000 to \$12,000,000,000 (P.L. 344). The Farm Credit act of 1955 (P.L. 347) authorized borrower co-operative associations to acquire full ownership of and to retire government capital in such banks. The interest rate on disaster and special emergency loans, which had been increased to 5%, was reduced to not to exceed 3% by P.L. 132. The authority of the secretary of agriculture to make emergency loans to farmers and stockmen in disaster areas was extended to June 30, 1957, with a \$15,000,000 limitation.

Administratively, 1955 was a trying year, in spite of progress made in increasing agricultural exports, reducing some government-held surplus stocks and general success in holding the line on flexible price supports. Not only were critics more active but some hundreds of farmers not in compliance with support programs appeared more resistant to paying penalties and less averse to challenging the department in the courts. The Blattner case, challenging the constitutionality of the federal farm crop acreage control laws, was appealed to the U.S. court of appeals but dismissed. Federal inspectors were indicted for

CORN-PRODUCING AREAS IN THE U.S.S.R. in relation to the latitude of Iowa, visited by Soviet agricultural economists in 1955. The original of this map appeared with an article discussing the problems of Soviet production in *Successful Farming* magazine

trespass in Maryland. Grain bins purchased by the government in part proved defective. A purchase-resale transaction, in which the department in shifting from a cheese support rate of 90% to 75% in April 1954, paid cheese distributors 37 cents a pound and then sold it back at 34½ cents per pound, was seriously questioned.

Congress, for the third consecutive year, appropriated more money for the department of agriculture than had been requested. The total of \$1,334,917,855 carried \$696,917,855 in direct appropriations for the fiscal year 1956, \$388,000,000 in lending authority and \$250,000,000 in advance authorization for conservation program subsidies.

Drought, Flood and Famine.—The U.S. was particularly hard hit in August in parts of the closely settled industrial northeast by torrential rains in the wake of Hurricane "Diane." The national government supported a flood relief program of grants totalling perhaps as much as \$100,000,000. All of New Jersey and Connecticut, plus parts of New York, Pennsylvania, Massachusetts and Maryland, were officially designated as areas in which farmers might obtain loans at 3% interest to repair damage and continue farming. Again in mid-October floods resulting from heavy rains struck further blows at many of the same northeastern areas. Parts of the southeastern and Gulf coast areas were also flooded during the year and parts of the great plains suffered flood damage as the drought broke in May, and again in September-October.

The Tampico area of Mexico was badly flooded. About 45,000,000 persons in India and Pakistan were reported as afflicted by terrible September floods on the Ganges, Brahmaputra and Indus rivers. The Punjab was reported as ravaged by the greatest flood of the century. The U.S. contributed 10,000 tons of wheat and an equal amount of rice to relief of the area. There were reports of floods from China, and typhoon-associated floods much reduced the Japanese rice crop.

Drought touched the U.S., not lightly, but without resulting in major disaster. Spring drought in the southern great plains, with accompanying wind and dust storms, made necessary anti-blowing tillage of millions of acres. The wheat acreage was reduced sharply, but remedial rainfall came in time to encourage replanting with feed crops, especially grain sorghums. Drought in northeastern U.S. and neighbouring provinces of Canada was relieved in August. Damage to livestock resulted in April when much snow paralyzed the northern mountain states.

Spring and early summer famine, reported as perhaps the worst in 90 years, afflicted wide areas of Red China and perhaps

180,000,000 persons. U.S. planes parachuted 1,000 tons of rice to villages in northern Laos hit by drought.

Other Countries.—Not only did the food situation ease further in 1955 in many countries outside the U.S.S.R. and its satellites, but surpluses of some commodities were a mounting problem. Stocks of five major grains in the four principal exporting countries reached a new record high estimated at 116,000,000 short tons, about 2% more than the previous record high of 1954.

The FAO (Food and Agriculture Organization) announced that world food production, excluding the Communist bloc, increased 25% in the decade since World War II, had recently increased faster than population, but that people in some areas were hungry whereas burdensome surpluses accumulated in others. This dislocation between supplies and consumers was partly charged to rigidities in the production pattern, sometimes intensified by price supports of individual commodities. Some other weaknesses noted in the world agricultural situation were the failure of consumption to increase with production, decline in world trade of agricultural products to 15% of output compared with 20% before World War II (partly because of emphasis on self-sufficiency and tendency to expend limited funds for imports of capital goods), and finally, the low level of farm incomes in relation to those of other occupations.

World livestock numbers increased to new record levels, cattle and sheep for the eighth consecutive year, cattle to a level 18% above prewar, sheep 14% above, and hogs 9% above prewar. Meat production in principal countries, exclusive of the far east, was a new record high, more than one-fifth above the prewar level.

Canada.—As usual, the prosperity of Canada depended first of all on wheat. Canadians wrestled with what was probably the worst wheat jam in their history. A bumper 1955 crop of high quality wheat was estimated at 500,587,000 bu., 67% more than the very poor crop of 1954 and above average, but far short of the record 687,922,000 bu. of 1952. The 435,800,000 bu. of 1955 crop, 42% more than in 1954, resulted from expanded acreage (11,178,000 ac.) and a high per acre yield of 39 bu. The barley crop of 268,798,000 bu. was the second largest on record, 53% above 1954 and 46% more than the ten-year average.

Abundant reserves from previous harvests, much of which had not yet been moved from the farms, included 481,363,000 bu. of wheat, 81,127,000 bu. of oats, 87,238,000 bu. of barley and 17,872,000 bu. of rye. In total tonnage these stocks were 22% less than a year earlier but approximately double the average for the previous decade.

Livestock numbers increased, excepting horses. The 10,239,000 head of cattle and calves on farms as of June 1, 1955, represented the third largest inventory on record. The spring pig crop of 4,827,000 pigs saved was up 14% as compared with 1954 and a 13% increase was indicated for the fall crop, bringing the year's production to the highest level since World War II and the fourth largest on record. Sheep showed a fractional increase to 1,723,000 head.

The large grain reserve plus the large new crop, without major expansion in livestock feeding and with an actual decline in export, added up to a grain glut: a difficult on-the-farm storage problem, widespread elevator congestion, some unemployment and tied-up shipping, as well as lower incomes for farmers. Farmers received \$1,030,800,000 in the first half of 1955 compared with \$1,060,800,000 and \$1,186,000,000 during the same periods of 1954 and 1953, respectively. Lower participation payments on wheat from the Canadian wheat board and decreased revenue from sales of hogs and oats were the major causes of the decline.

Latin America and Southern Hemisphere.—This diver-

area presented a mixed situation. Food shortages developed in some Central American countries which had a surplus of cash export crops such as coffee and cotton. Deflation of the coffee market presented some serious problems in Brazil. After cotton and coffee prices had been driven so high that they would not move freely in the competitive world market the export cruzeiro was revalued. Argentina expanded agricultural production but had not yet regained earlier levels, though exports of livestock and meat products increased. Carry-over stocks of wheat and barley increased moderately, whereas those of corn, oats and rye declined. Sugar growers in Peru requested an increase in the amount which might be shipped to the United States.

South Africa experienced a serious surplus corn storage and transport problem, the result of a record crop in 1953-54 followed by one nearly as large (138,000,000 bu.) in 1954-55. Planting of citrus and subtropical fruits was much increased.

Both Australia and New Zealand increased meat production and exports. Total exports of frozen and chilled meat from Australia in 1954-55 were 38% higher than in the previous year. New Zealand made sizable shipments of ewe mutton and beef to the U.S.S.R.

Sheep numbers increased, weather was favorable, and wool production of Australia, New Zealand and South Africa showed marked increases in output. Auction prices for Australian wool, which had declined about 15% in 1954, declined something like 10% more in 1955, giving rise to balance of payment problems which led to restriction of imports. The dairy industry of New Zealand found itself in increasing difficulties with the end of bulk purchasing by the U.K. Dairy product prices were lower and competition with meat and wool production became more severe.

Western Europe.—Western and southern Europe experienced further modest recovery in agricultural production as regards both crops and livestock as the over-all economies boomed. Output per unit of land was high but mechanization and increase in output per farmer made slow progress. Surplus of some agricultural products appeared and restrictions on some imports were continued and tightened, though takings of fats and oils and cotton remained high. The wheat crop, though not much larger than in 1954, was of better quality and approached record size in Italy, the German Federal Republic and France, the latter country having an indicated unusual export availability of about 100,000,000 bu. The U.K. imported 1,258,000 boxes of apples from North America, the first since 1951-52.

Food exports to countries east of the "iron curtain" were increased.

A beef surplus appeared in Norway. Irish fat and feeder cattle and sheep exports, mostly to the U.K., were up more than one-fourth in the first half of 1955 as compared with a corresponding period in 1954.

Imports of butter declined by one-fifth, though western Germany took increased amounts of butter and cheese. Ireland banned cheese imports, whereas the U.K. liberalized quotas on cheese imports from North America. Italian farmers protested increased cheese imports.

The large subsidy factor in British farm income came under increased discussion and criticism. But the statutory minimum wage for male farm workers in the U.K. having been increased from £6 to £7 per week (\$16.68 to \$19.46), the guaranteed prices for 1955 domestic grain were increased to the following prices (in U.S. equivalent) per bushel: wheat, \$2.23; rye, \$1.62; barley, \$1.47; oats, \$0.92; and mixed grain, \$2.88 per 100 lb.; all, nevertheless, moderately below the support levels on 1954 crops.

British grain farmers completed their first year of experience with the free market after 15 years of control. The average

price received for home-grown wheat in the market place proved to be about two-thirds as high as the standard prices prescribed by the Agricultural act of 1947. The deficiency payments scheme, in spite of some administrative problems, appeared to have worked rather better than had been anticipated. Livestock price guarantees were continued.

The Danes managed to obtain a higher price for bacon delivered to the British. Previously paid 237s. 6d. per hundredweight for a product which in turn was sold by the government for more nearly 328s., the new arrangement, effective for 12 months, beginning Oct. 1, called for a base price of 240s., with any excess obtained by the government above 270s. per hundredweight to be passed on to the producing country.

France struggled with a rising cost of living, which was in part blamed on expanded export of meat in spite of increased domestic demand. Efforts to solve the problem of excessive wine stocks were largely unrewarded, though more aggressive export and greater diversification of agriculture in producing areas was attempted. The grape harvest began exceptionally early under uncommonly favourable weather, promising, perhaps, an outstanding vintage.

The important Spanish food crop, wheat, was short because of drought in the centre and north, but export oranges were in over-supply. Spain made plans for supplying water to an additional 1,250,000 ac. over a ten-year period and proceeded with increased mechanization of farming.

Middle East.—Agricultural response was generally favourable in the middle east during 1955. Food grains and feed grains were relatively abundant. Turkey's wheat crop was significantly larger than in 1954 and above average, but Turkey's farm price support program, activated by purchasing grain at prices above the world market, appeared to be in serious difficulties. Egypt arranged to trade some of its surplus cotton to the Soviet bloc countries for needed fuel imports. Export taxes on most types of cotton were sharply reduced in September. Israel embarked on a modern poultry industry, based on broiler chickens and turkeys. Iraq, a major producer of dates, reported a crop 30% less than the record crop of 1954. Turkey by subsidy increased its efforts to export figs and raisins.

Eastern Europe and the U.S.S.R.—The outstanding agricultural event was the somewhat delayed but eventual exchange late in the summer of farmer delegations between the U.S.S.R. and North America, followed by exchange between the U.S.S.R. and the U.K. Initial indications were that the observations of the U.S.S.R. group to North America, led by Vladimir M. Matskevich, acting Soviet minister of agriculture, would probably result in attempts to make more efficient application of farm labour and in the mechanization of some of the nonfield work plus the purchase of about 60 head of hardy crossbred cattle of the Santa Gertrudis breed and, perhaps, as much as 300,000 bu. of hybrid seed corn after the later visit to the U.S.S.R., by invitation, of Roswell Garst, Iowa hybrid seed-corn grower and distributor.

The U.S. delegation, led by W. V. Lambert, dean and director of the University of Nebraska College of Agriculture (Lincoln), were impressed with the large amount of labour lavished on agricultural operations in the U.S.S.R., particularly on the lagging livestock husbandry. One farmhand in the U.S. was estimated to have an output at least five times that of equivalent labour time in the U.S.S.R. They found the growing of corn being attempted practically everywhere, in line with the program set by Moscow. Planting perhaps reached nearly 40,000,000 ac., four times as much as in 1954. However, much of the crop appeared to be a near failure as to grain production, as might have been reasonably anticipated from known climatological facts, although it was useful for silage. The Ukraine was

reported to have good crops, after much drought damage in 1954. This area, better adapted climatically to corn production than most in the U.S.S.R., was reported to have 15,000,000 ac. devoted to corn, ten times as many as in 1950, and with a goal of 20,000,000 ac. by 1960.

The subhumid or semiarid virgin grasslands in Kazakstan and other parts of the east of perhaps as much as 50,000,000-ac. extent, newly broken under the plan for major expansion of small grains, were reported to have suffered severely from drought during the year. Nevertheless, the delegation reported that the U.S.S.R. was not facing a major agricultural crisis. Farmers appeared to be fully as well if not better fed than the urban population. Bread was everywhere available at low cost, though meat and milk were not.

In eastern Europe several countries, including Czechoslovakia and Bulgaria, took steps to meet the recent food deficit by holding more able-bodied workers on the farms. Czechoslovakia also announced an increase of up to 10% in prices paid to farmers for their products. In Hungary, after the fall of Premier Imre Nagy in April, Matyas Rakosi stressed the necessity of proceeding with the expansion of the socialistic sector of agriculture which then included one-third of the arable land, to cover more than half of the total by 1960. Emphasis was to be on the most advanced type of collective farm. There must be more food; there was to be no open compulsion; but collective farmers were no longer to be permitted to leave if they wished, as was formerly the case.

Yugoslavia, more firmly associated with the west, also made a firm effort to increase agricultural production by price incentives and "other measures," apparently by greater investment in the agricultural sector.

Albania promptly rejected, as "foreign interference," the offer by U.S. Pres. Dwight D. Eisenhower to make surplus foodstuffs available through the League of Red Cross societies.

Far East.—Though this wide area as a whole made less progress in expanding its agricultural supplies in keeping with its population uptrend than other parts of the world, rice became surplus in 1955. China sold some rice in spite of spring famine in some provinces. The government was reported as decreeing a reduction of as much as one-third in state sales of rationed food to rural consumers. Many were reported to have been sent back to their native villages to increase food production and to reduce the urban feeding problem. The cotton crop of China was reported to be a large one.

Progress was reported in the Colombo Plan area, with famine overcome. A typhoon in late September reduced what promised to be the record large rice crop of Japan to a much smaller one. Substantial amounts of U.S. surplus agricultural products were exchanged for Japanese yen. Formosa pushed food production with considerable success. Recovery in Indonesia progressed slowly. Revision of the 1946 trade agreement between the United States and the Philippine republic, effective Jan. 1, 1956, included new duty provisions with respect to several agricultural products. Philippine sugar would remain under a fixed annual import quota of 952,000 short tons.

The famine area of north Vietnam, usually deficit to the extent of about 100,000 tons of rice, was aided by 150,000 tons of Burmese rice purchased by the U.S.S.R. for delivery to Haiphong.

International Agricultural Organizations.—The Food and Agriculture Organization of the United Nations noted the first decade of agricultural rehabilitation and expansion after World War II, as well as its own tenth anniversary, by a substantial report, "The State of Food and Agriculture, 1955—Review of a Decade and Outlook" (Rome, Italy, Sept. 1955, 236 pages).

Belgium, Luxembourg and the Netherlands asked the govern-

ing body of G.A.T.T. (General Agreement on Tariffs and Trade) for a waiver of the rules which prohibit discriminatory application of import controls on agricultural products.

The International Cotton Advisory committee, which met in Paris in June, interested itself largely in government policies affecting cotton. The eighth general meeting of the International Federation of Agricultural producers in Rome in September was attended by 200 delegates from 27 nations.

The International Wheat conference, held in Geneva, Switzerland in October, was attended by the 48 signatory countries of the second, 1953-56, agreement and by many of the additional 32 countries invited. Specific consideration was given to the question of whether and on what terms the agreement should be renewed.

Aircraft Manufacture. Production of military aircraft continued during 1955 to make up the major portion of the work of the United States aircraft industry. The military services passed the peak of their buildup programs during the year and production dropped below the 1954 rate, but maintained a rate which the aircraft industry felt was healthy as regards their ability to expand rapidly in the event of another emergency.

From a rate of about 1,000 planes a month in early 1955, production fell off to about 700 planes a month by the end of 1955, more than 75% of which were jet-propelled types. A combat aircraft in production for the U.S. air force were jet and even in the noncombat categories, such as tanker and transport aircraft, jet and turbine-propeller engines (turboprops) were gradually replacing the old piston engines. The end was also in sight for production of navy piston engine combat aircraft.

The Aircraft Industries Association of America estimated that military production for 1955 would amount to about 8,500 aeroplanes. In addition, the industry turned out approximately 4,000 utility aircraft and about 200 airline-type transports, for a total production of 12,700 aeroplanes. This compares with an over-all production of 14,100 planes in 1954 and more than 16,000 in 1953.

Despite the decline in numbers of aeroplanes produced, very little change was reflected in the industry's sales position. The continuing military demand for more and more performance in its aircraft was an important factor in sales volume. The new very high speed aircraft demand heavily stressed airframes to withstand pressures at operational speeds. Also, the introduction of new complex electronic equipment added to both the weight and the cost per unit. Industry wages climbed again, and did material costs. The combined result of all these factors coupled with added emphasis on guided missile production brought about a gross sales volume only slightly below that of the preceding year.

Sales of the 12 leading airframe companies (an industry yardstick) were estimated at \$4,850,000,000, compared with \$4,920,000,000 in 1954. Total industry sales in 1955 were estimated at about \$8,000,000,000, compared with \$8,200,000,000 in 1954. It was also estimated that the industry profit in 1955 would be 3.7% of sales, approximately the same as in the preceding year, but a large gain over 1953 and 1952, when profits had averaged only 2.2%. This figure, however, was still low in comparison

MCDONNELL XV-1 CONVERTIPLANE, first aircraft to successfully combine both the vertical flight of a helicopter and the speed and range of conventional planes, shown in its first flight at Smartt field, Mo., in 1955

with the average profit for all U.S. manufacturing industries, particularly when it is considered that the aircraft industry is forced to divert a large portion of its profits to purchase of new tools and equipment each year as new military developments dictate changes in manufacturing procedures.

The guided missile field showed promise of balancing the drop in aeroplane production. A survey showed about 25 different types of missiles under development, at least 8 of which had reached production status. Four missiles were far enough advanced to be assigned to operational units. These included the Glenn L. Martin company's Matador and Chance Vought's Regulus, both surface-to-surface "pilotless bomber" types; Hughes Aircraft's Falcon, an air-to-air missile; and the Western Electric Nike, an army anti-aircraft missile.

In 1955, the U.S. aircraft industry averaged about 735,000 persons directly employed by airframe, engine, propeller and parts companies, a drop from 800,000 at the end of 1954. Employment was expected to decline to about 700,000 in the early months of 1956 and to remain stable for a time at that point.

Production was accelerated of a number of new, very high performance military aircraft, notably the McDonnell F-101, Convair F-102 and Lockheed F-104, supersonic air force fighters, and the Grumman F9F-9, a supersonic navy fighter. All of these types were approaching operational status at the year's end. Douglas Aircraft Co. and North American Aviation, Inc., continued to turn out navy F4D's and air force F-100's, first supersonic fighters to reach operational status. (The F-100 set a world speed record of 822.135 m.p.h. during the year.) Boeing Airplane Co. produced enough B-47 jet bombers to equip all U.S.A.F. medium bomber units, and stepped up production of its eight-jet B-52, first units of which were delivered to service units. For increased production, Boeing's Wichita, Kan., plant was assigned as a B-52 second source.

In the production of commercial aircraft, Douglas announced its intention to build an all-jet DC-8 airline transport and started initial work. Boeing continued development of its Model 707 Commercial jet airliner. Lockheed Aircraft Corp. announced sales of its new turboprop Electra airline transport and other manufacturers were preparing to enter the turboprop field.

The Aircraft Industries Association of America estimated that the total airframe weight, of military and civil aircraft, to

be produced in 1956 would be very close to the 137,500,000 lb. produced in 1955 and that the sales volume would fall only slightly below \$8,000,000,000, with the profits to sales ratio remaining between 3.5% and 4%. (See AVIATION, CIVIL; AVIATION, MILITARY; JET PROPULSION; MUNITIONS.) (J. J. Hy.)

Air Races and Records. Col. Carlos M. Talbott of Charleston, Ill., won the Bendix trophy at the 1955 National Aircraft show at Philadelphia, Pa. He raced his Super Sabrejet 2,325 mi. across the country from George air force base, Victorville, Calif., in 3 hr. 48 min. 4 sec., for an average speed of 610.726 m.p.h. The big United States air show, held Sept. 3, 4 and 5, attracted nearly 300,000 spectators and military observers from many nations, including the Soviet Union and Hungary.

Prior to the finish of the Bendix race, three B-47 medium bombers roared in from March air force base at Riverside, Calif., in a race for the General Electric trophy. Maj. Leonard J. Stevens of Chicago, Ill., piloted the winning craft and covered the 2,337-mi. route in 3 hr. 57 min. 59.2 sec. for an average speed of 589.294 m.p.h. Comprising Maj. Stevens' crew were Maj. F. J. Weedman, Bristow, Okla., Capt. G. F. Fornes, Buffalo, N.Y., and Staff Sgt. J. P. Flohe, Suttons Bay, Mich.

The Allison trophy, awarded for dexterity and speed in changing engines, was taken by a crew from the Webb air force base at Big Spring, Tex. It marked the first time such an event had been held at the national show and six teams made up of five workers and one inspector each matched skills at changing hot J-33 Allison engines on Lockheed T-33 jet training planes. The winning time was 11 min. 32.2 sec.

The third day of the exhibition was marked by an official announcement that an air force test pilot had set a world jet speed record of 822.135 m.p.h. in straight and level flight. Piloting a North American F-100C Super Sabre, Col. Horace A. Hanes established the new standard at a height of 40,000 ft. over the Muroc desert of California on Aug. 20. Col. Hanes flew level and straight downwind and upwind runs at 870.627 and 773.644 m.p.h. For his achievement of flying 1.23 times the speed of sound, Col. Hanes was awarded the Thompson trophy for 1955.

On March 9, 1955, three U.S. army jets all broke the coast-to-coast speed record. Lieut. Col. Robert R. Scott of Des Moines, Ia., was the first to finish the run from Los Angeles, Calif., to New York, his time being announced as 3 hr. 46 min. 33 sec. A recheck of the course of 2,464 mi. gave him a time of 3 hr. 44 min. 53 sec. and an estimated average of 652 m.p.h., which were accepted as new standards by the National Aeronautic association. Eight Republic F-84F's started the cross-country flight, but only three finished, the other successful pilots being Maj. R. C. Ruby of Des Moines and Capt. C. T. Hudson of Gulfport, Miss.

A national guard flier fulfilled a dream of breakfasting in Los Angeles, lunching in New York and dining in Los Angeles in the same day when he flew the round trip in less than 11½ hr. on May 21. Lieut. John M. Conroy, flying alone in an F-86 Sabrejet, made the record trip of 5,085 mi. at an average speed of about 445 m.p.h. in 11 hr. 26 min. 33 sec. He had six short refuelling stops. On the return flight from New York, Lieut.

JACQUELINE AURIOL seated in the cockpit of the turbojet fighter Mystère IV in which she set a new women's air speed record of 715.35 m.p.h. July 1, 1955

Conroy broke the east-to-west standard of 7 hr. 4 sec. set in 1947 by Paul Mantz.

Two British pilots set a record for a dual crossing of the Atlantic on Aug. 23. Capt. John Hackett, pilot, and Peter Money Penny, navigator, flying a Canberra twin-jet bomber, made the trip of 6,920 mi. from London to New York and return in 14 hr. 21 min. 45.4 sec.

Ten F-84F fighters established two world standards, one for time, one for nonstop mass flight distance, on Aug. 17 when they streaked from Sturgate in England to Austin, Tex., in 10 hr. 48 min., averaging about 480 m.p.h. for the 5,118 mi. The Thunderstreaks were from Austin's 27th strategic fighter wing.

On Oct. 16, 1955, the Boeing 707 jet-powered transport, experimental craft not yet in commercial service, streaked across the country from Seattle, Wash., to Washington, D.C., and back in a total time of 8 hr. 6 min., setting new unofficial transport speed records for both directions and the round trip.

Harmon trophies for 1955 were awarded to J. F. Coleman, test pilot for General Dynamics' Convair division at San Diego, Calif., and Capt. Marion H. Eppes, U.S. navy. Flying the XFY-1 Pogo turboprop V.T.O. fighter, Coleman made more than 60 free vertical take-offs and was the first person in history to make a transitional flight from vertical take-off to level flight and return to a vertical tail-sitting landing. Capt. Eppes was recognized for extraordinary achievement as commander of the Goodyear navy airship ZPG-2 in a simulated antisubmarine patrol, when he remained aloft for more than eight days and cruised more than 3,000 mi. In so doing, he broke all world marks for self-sustained nonrefuelling flight for any aircraft.

Wing Comdr. Walter Gibb, test pilot for the Bristol Aircraft company, flew a Canberra jet bomber to a new unofficial altitude record of 65,876 ft. over England on Aug. 29, 1955.

Jacqueline Auriol of France officially became the world's fastest aviatrix when she flew a French-built Mystère IV turbojet at 715.35 m.p.h. to surpass Jacqueline Cochran's standard of 675.468 m.p.h. The ninth annual transcontinental race from Long Beach, Calif., to Springfield, Mass., in July featured the year for women fliers in the United States. Mrs. Frances S. Bera, Los Angeles, and her sister, Mrs. Edna Bower, Long Beach, Calif., flying a Cessna 180, won first prize on corrected time.

Mrs. Alice Roberts, Phoenix, Ariz., and Mrs. Iris Critchell Palos Verdes Estates, Calif., were second. Forty-two of the 4 starters finished the handicap test, which is sponsored by Ninety Nines, Inc. Another handicap event for women was held in June, the race being from Washington, D.C., to Havana, Cuba. First prize was annexed by Bernice Trimble, Flint, Mich., and her co-pilot Joan Rhubec, Cleveland, O. (See also AVIATION MILITARY.) (T. V. H.)

A.L.A.: see AMERICAN LIBRARY ASSOCIATION.

Alabama. Alabama, the "heart of Dixie," was a part of the Mississippi territory when it was admitted to the union on Dec. 14, 1819, as the 22nd state. Located in the southeastern part of the United States, it is bounded by Tennessee on the north, Georgia on the east, Florida and the Gulf of Mexico on the south and Mississippi on the west. Known as the "Cotton state" or "Yellowhammer state" (from the state bird, the yellowhammer or flicker), Alabama's area includes 51,071 sq.mi. of land and 531 sq.mi. of water. The 1950 census population of Alabama was 3,061,743, of which 1,340,937 was urban and 1,720,806 rural; 2,032,714 white and 982,152 nonwhite. The estimated population July 1, 1955, was 3,006,000. Montgomery, the state capital, had a population of 106,525 in 1950. Other major Alabama cities and their population (1950 census): Birmingham 326,037, Mobile 129,009, Gadsden 55,725, Tuscaloosa 46,396, Bessemer 28,445, Anniston 31,066, Dothan 21,582, Decatur 19,974, Huntsville 16,437, Phenix City 23,305, Selma 22,840, Florence 23,879.

History.—Gov. James E. Folsom asked again and again for the end of racial bigotry during the legislative session of 1955. He vetoed two bills aimed at preserving racial segregation, and refused to sign a School Placement bill on the same grounds. At his inauguration on Jan. 17, he said, "Hate can destroy any man or any society, but by working together we can accomplish any desired goal." With this the governor set the stage for his administration.

Court action opened the door of the University of Alabama to Negroes for the first time. Registration was to begin in 1956. Cases were under consideration in many of Alabama's counties which would further reflect the supreme court's ruling regarding school segregation.

The legislature approved an educational appropriation of \$116,000,000, an increase of \$26,000,000 over 1954-55. A school bond issue of \$110,000,000 faced a referendum in Dec. 1955, with every chance of approval. This \$110,000,000 was programmed entirely for capital outlay for new school buildings.

The legislature changed the name of the old State Department of Public Welfare to the Department of Pensions and Security, and repealed the Relative Responsibility act. Every person over 65 years of age was made eligible for a pension, if need could be proved.

Mental hospitals received \$3,000,000 for new buildings during the year. More than \$250,000,000 was expected to be spent on new roads in Alabama during the current four-year administration of Governor Folsom. An additional \$225,000,000 was programmed for toll-road construction which would extend north and south across the state from the Gulf of Mexico to Tennessee, linking up with the Chicago-to-Miami superhighway.

New industry poured into the state at the rate of \$30,000,000 per month for the first 10 months of 1955, with a total of \$302,000,000 through September. This did not include expansions of existing facilities, such as \$30,000,000 for the Alabama Power company and \$20,000,000 for Southern Bell Telephone and Telegraph. New plant facilities and improvements planned and

being contracted would total nearly \$500,000.000 for 1955-56.

On the governmental side, there was still some unfinished business. Having called three special sessions of the legislature and one regular session in order to get his program through, Governor Folsom announced plans for another special session in Jan. 1956 to deal with reapportionment of the state legislature. The constitution adopted in 1901 states that the legislature will reapportion itself according to county population every ten years. Because of its black-belt (so-called because of geographical location of black soil where most of Alabama's cotton is produced) control the legislature had never in its 54 years reapportioned itself, under the present constitution.

Principal state officials during the period Jan. 1955 to Jan. 1959 were: governor, James E. Folsom; lieutenant governor, W. Guy Hardwick; attorney general, John Patterson; state auditor, Mrs. Agnes Baggett; commissioner of agriculture and industries, A. W. Todd; secretary of state, Miss Mary Texas Hurt; state treasurer, John Brandon; state education superintendent, Austin R. Meadows.

Education.—During the school year ended June 30, 1954, Alabama had 2,855 schools in the public school system (elementary and high schools). There were 448,970 pupils enrolled in the elementary schools, which had 13,351 teachers; there were 254,679 pupils in the high schools and 9,444 teachers. State expenditures for education (secondary system, colleges, trade schools, etc.) in the fiscal year ended Sept. 30, 1955, amounted to \$90,685,715.

Social Insurance, Public Welfare and Related Programs.—During the fiscal year ending Sept. 30, 1954, annual expenditures for Alabama's public welfare department totalled \$36,784,468.63. Expenditures for public assistance, with the average number of persons receiving assistance in parentheses, were as follows: old-age assistance \$21,479,853.48 (64,257); aid to the blind \$466,578.17 (1,501); aid to the permanently and totally disabled \$2,600,968.65 (8,722); aid to dependent children \$8,091,166.66 (16,491); aid to children in foster care \$274,330.50 (754); and temporary aid \$37,315.80 (119).

Alabama in 1954 operated four prisons and 31 prison road camps. The total number of prisoners on Sept. 30, 1955, was 5,031. Total expenditures for the prison system during the fiscal year ended Sept. 30 totalled \$4,500,000, including \$2,500,000 worth of farm products, clothing and other items made or produced by the inmates. There were three reformatories with a total population of approximately 550 and state appropriations for the 1954-55 fiscal year amounted to \$381,200. The approved budget for 1955-56 was \$1,600,000.

For the fiscal year ending Sept. 30, 1954, public health expenditures totalled \$6,759,893.24. This figure included \$1,896,806.08 in state funds, \$2,965,915.63 federal funds and \$1,897,171.53 local moneys.

Maternal and child health services included 3,191 maternity clinics in 50 counties, with 54,238 patients admitted; 619 well-baby clinics in 21 counties, with 11,198 patients admitted, and 419 dental clinics in 30 counties with 11,888 patients admitted.

Communications.—All highways and roads in the state (federal, state and local combined) totalled 62,241 mi. as of Dec. 31, 1954, of which 16,534 mi. were paved and 29,392 mi. were either soil surfaced or graveled.

State and federal funds disbursed for highways and roads totalled \$89,200,000 in the 1954-55 fiscal year. New road and highway construction completed in the 1954-55 fiscal year aggregated 1,200 mi. (estimated). Alabama's railroad mileage during the year was approximately 5,054. There were 518,128 telephones in the state. Alabama had 105 airports including 66 public, commercial and private fields which were licensed and 39 personal unlicensed airfields, two government fields (Tennessee Valley authority) and 15 that belonged to the air force and navy. There is heavy barge traffic on the Tennessee river in north Alabama.

Banking and Finance.—As of Dec. 31, 1954, Alabama had 160 state banks and one branch with total deposits of \$380,067,000. Total resources were \$414,721,000. There were 71 national banks with 28 branches which had total deposits of \$1,111,240,000 and total resources of \$1,202,753,000. As of Dec. 31, 1954, there were seven state chartered savings and loan associations with total resources of \$19,133,000; 23 federal chartered savings and loan associations with total resources of \$108,239,000; 83 state chartered credit unions with total resources of \$15,827,000 and 49 federal chartered credit unions with total resources of \$4,591,000. Total state (government) receipts in the fiscal year ended Sept. 30, 1953, were \$320,214,010.14. Total state expenditures for that period were \$324,783,982.68. The state's gross debt was \$61,287,000 and the net debt was \$47,433,000.

Agriculture.—Alabama's total agricultural production in 1954 was valued at \$506,572,000, a decrease of 7% from 1953. The cotton crop (lint and seed) grossed \$142,796,000 compared with \$180,523,000 in 1953. Peanuts grossed \$11,750,000 in 1954 compared with \$19,995,000 in 1953. Cash receipts from marketings to Alabama farmers from crops in 1954 was \$209,166,000 and from livestock and livestock products \$187,114,000.

Manufacturing.—Alabama in 1954 had an estimated 5,300 manufacturing establishments employing approximately 225,000 persons who were paid \$718,600,000. The value of the manufactured products was \$3,000,000,000. Primary metals had an average monthly employment of 42,287; total wages paid, \$184,600,000. Textiles had an average monthly employment of 47,300; total pay \$115,400,000. Lumber had an average monthly

Table I.—Production of Leading Crops in Alabama

Crop	Indicated 1955	1954	Average, 1944-53
Cotton, bales	975,000	728,000	908,000
Corn, bu.	61,432,000	28,808,000	44,921,000
Peanuts, lb.	236,500,000	110,550,000	280,931,000
Hay, tons	671,000	497,000	666,000
Potatoes, Sweet, bu.	1,425,000	935,000	3,338,000
Potatoes, Irish, bu.	1,426,000	3,925,000	4,056,000
Oats, bu.	8,100,000	6,960,000	4,296,000
Soybeans, bu.	2,438,000	1,196,000	1,079,000
Sorghum grain, bu.	855,000	232,000	418,000

employment of 32,400; total pay \$60,100,000. Food products had an average monthly employment of 15,000; total pay \$42,900,000. Output value: primary metals \$887,000,000; textiles \$509,000,000; lumber \$198,000,000; food products, \$302,000,000. (R.H. H.)

Mineral Production.—Table III shows the preliminary data on Alabama minerals for 1953, the latest available, compared with 1952. The statistics cover all minerals valued at \$100,000 or more. In 1953 Alabama was third among the states in output of crude iron and ranked 18th in value of its mineral production, with 1.31% of the U.S. total.

ALAND ISLANDS: see FINLAND.

Alaska. Alaska, the northernmost territory of the United States, is separated from Siberian U.S.S.R. by the Bering strait. The boundary line follows the international date line between Big Diomed Island, which is soviet soil and in the eastern hemisphere, and Little Diomed Island, which is on the U.S. side in the western hemisphere. These islands are about three miles apart. Alaska has an area of 586,400 sq.mi. Its population in 1950 was 128,643 and the 1955 estimated population was 172,000, excluding military personnel. The principal cities and their 1955 estimated populations are Anchorage, 40,000; Fairbanks, 12,000; Juneau, 6,000; Ketchikan, 6,000; Seward, 2,500; Sitka, 2,200; Kodiak, 2,100; Petersburg, 1,800; Wrangell, 1,500. The Aleutian Islands, a chain of small islands extending about 1,200 mi. westward from the extremity of the Alaska peninsula, are part of the territory of Alaska.

History.—Development of Alaska's timber resources continued during 1955. A sawmill at Wrangell began exporting lumber to Japan, and high grade pulp from a new \$52,000,000 plant

at Ketchikan was shipped to both foreign and domestic markets. Two additional pulp plants, one at Juneau and one at Sitka, were in the active planning stage. Both would utilize timber from Tongass National forest in southeastern Alaska.

A pipeline to carry military oil supplies was completed from Haines, near the northern end of the 1,000-mi. inland passage, to Fairbanks. Construction was started on the wide-flung Defense Early Warning line of radar stations along the Arctic coast.

Exploratory oil wells were being drilled in several areas during the year and interest in Alaska's oil potential continued high, with 2,487,337 ac. of oil leases to petroleum companies and individuals in effect on July 1, 1955.

The Eklutna hydroelectric power plant near Anchorage, built by the U.S. bureau of reclamation, was placed in service during the year. Investigation of other power sites continued but no new construction was initiated.

Tourist travel declined somewhat in 1955 as a result of the withdrawal of four American flag passenger ships from the Alaska route, but it was greater than anticipated, with a considerable increase in air travel.

None of the Alaska-Hawaii statehood bills introduced in the first session of the 84th U.S. congress was enacted. In March the Alaska legislature enacted a bill providing for a convention to draft a constitution for the proposed state. Alaska voters selected 55 delegates to the constitutional convention at a special election on Sept. 13 and the convention was convened at the University of Alaska at College, near Fairbanks, on Nov. 8.

Alaska officials in 1955, appointed by the president, included Governor of Alaska B. Frank Heintzleman and Secretary of Alaska Waino E. Hendrickson. Elected territorial officials were: J. Gerald Williams, attorney general; Henry A. Benson, labour commissioner; Hugh J. Wade, treasurer; and Irving Reed, highway engineer.

Education.—During the 1954-55 school year a total of 31,437 students were enrolled in elementary and secondary schools operated under the direction of the Alaska department of education. Another 5,000 were enrolled in grades 1 through 12 in 84 day schools and two boarding schools operated by the Alaska native service, a division of the U.S. bureau of Indian affairs.

Communications.—During 1955 the Alaska railroad, owned by the federal government, had 470 mi. of main track extending from Seward to Fairbanks, plus 65 mi. of branch lines. The White Pass & Yukon railroad, operating between Skagway, Alsk., and Whitehorse, Yukon Territory, had 20 mi. of track in Alaska.

The territory had approximately 1,000 mi. of through roads, 650 mi. of which were paved; 1,200 mi. of feeder roads, and 1,500 mi. of local roads.

Nine certificated mail carriers, two certificated nonmail carriers, 10 exempted carriers and 115 pilot-owners were engaged in air transportation within Alaska during the year.

Radio and telegraphic communication within Alaska and between Alaska and other places is handled by the Alaska Communication system, operated by the signal corps, U.S. army. There were 12 radio broadcast stations and four television stations in operation in Alaska in 1955, with another television station scheduled for opening near the end of the year. Seven daily and 12 weekly or semiweekly newspapers and several periodicals were published during the year.

Banking and Finance.—In the fiscal year ended June 30, 1955, territorial tax collections amounted to \$14,945,331, a slight decrease from the previous year. At the end of the fiscal year the territory's cash balance was \$9,271,961, with a surplus of approximately \$6,000,000 in the general fund. The territory had no bonded indebtedness. On June 30, 1955, six national and 12 territorial banks in Alaska had a combined capital of \$2,699,800, surplus of \$3,020,000, deposits of \$147,402,340 and undivided profits of \$2,015,305.

Agriculture.—The territory produced \$2,877,952 worth of agricultural products in 1954, with dairy products accounting for nearly half of the total. Cropland in the territory totalled 13,215 ac.

Timber.—A total of 182,000,000 bd.ft. of timber, valued at \$466,000, was cut from Alaska's two national forests during the fiscal year ended

June 30, 1955. This was more than double the yield of the previous year.

Fisheries.—Products of the Alaska fishing industry in 1954 amounted to 222,377,520 lb., with a wholesale value of \$77,879,446. In 1955 the Alaska salmon fisheries produced only approximately 2,300,000 cases of canned salmon, the smallest yield from this fishery in half a century.

(B. F. HN.)

Mineral Production.—The accompanying table shows the tonnage and value of those mineral commodities produced in Alaska in 1952 and 1953 (preliminary) whose value exceeded \$100,000.

Albania. A people's republic in the western part of the Balkan peninsula, Albania is bounded north and east by Yugoslavia, south by Greece and west by the Adriatic sea. Area: 11,100 sq.mi. Pop.: (1945 census) 1,122,000; (1954 est.) 1,260,000. Language: literary Albanian and two spoken dialects, the Gheg north of the Shkumbi river and the Tosk in the south. Religion: Moslem 65%, Orthodox 23%, Roman Catholic 11%. Chief towns (1949 est.): Tirana (cap.) 80,000; Scutari 60,000; Shkoder 30,000; Kortcha or Koritsa 28,000. First secretary of the Albanian Workers' (Communist) party in 1955 was Enver Hoxha; chairman of the presidium of the people's assembly Haxhi Leshi; chairman of the council of ministers, Mehmet Shehu.

History.—Events in Albania in 1955 followed in the main the pattern of previous years. The Communist government remained in uneasy control of the country, but failed to progress toward making its regime acceptable to the people. In agriculture, the government was compelled to abandon a significant part of its political theory. On Aug. 11 it issued a decree by which it abandoned the centralized planning of all agricultural produce except rice and some industrial crops. The decree admitted the failure of centralized planning by stating that under the new arrangements farmers would be encouraged to produce more by exercising their own initiative.

The lack of ideological education of party members came for much criticism in the party press. Shortcomings of this nature, according to the critics, led to apathy and indiscipline and was largely responsible for the number of thefts of state property which was causing concern to the authorities.

Albania followed the example of the Soviet Union and on Sept. 3 announced a reduction in the strength of the armed forces. By the end of the year 9,000 men out of about 45,000 were to be released.

In foreign affairs there was one important change in Albania's situation. On May 14 Albania was admitted to the Warsaw treaty of mutual defense by which an integrated command of the Soviet and satellite armies was established. The importance of this step lay in the fact that it was the first time the Soviet Union had formally committed itself to Albania's defense. Special efforts were made by the government to improve relations with Yugoslavia, and these resulted in frontier agreements and the exchange of official visits on a small scale. Albania made further approaches to Greece, but no progress was registered. Likewise there were no developments during the year to bring Albania into better relations with the western countries. (See also EASTERN EUROPEAN ECONOMIC PLANNING.) (M. MACK.)

Education.—Schools (1954): primary 2,140, pupils 136,800; high primary 315, pupils 39,700; secondary 28, pupils 8,600; teachers' training college and five institutions of higher education, students 1,200.

Agriculture.—No reliable data published since 1948. Main crops (metric tons, 1934-38; 1947 est. in parentheses): maize 134,000 (140,000); wheat 40,000 (54,000); oats 9,000; barley 5,000; rye 3,000; rice, par 1,000; potatoes 2,000 (4,000); olives 17,000; tobacco 1,600. Livestock (1938; 1946 est. in parentheses): sheep 1,573,900 (1,548,000); goats 932,000 (854,000); cattle 391,200 (345,000); pigs 15,300 (35,000); horses 54,400 (50,000); asses 44,600 (40,000); mules 10,000; buffaloes 22,000.

Industry.—Crude oil output (metric tons, 1954; 1955 plan in parentheses): 230,000 (263,000). Production (1950; 1955 plan in parentheses): electricity 21,000,000 kw.hr. (121,000,000 kw.hr.); cement (metric tons) 15,000 (58,000); sugar (tons) 610,000 (11,000,000); textiles, cotton woollen 1,100,000 m. (21,000,000 m.); footwear (pairs) 272,000 (5,000); soap (tons) 950 (3,700).

Finance.—Budget (1952 est.; 1953 est. in parentheses): revenue 9,400,000 leks (11,350,000,000 leks); expenditure 9,834,000,000 leks (

Mineral Production of Alaska

(In short tons, except as noted)

Mineral	1953		1952	
	Quantity	Value	Quantity	Value
Coal	861,000	\$ 8,452,000	686,000	\$ 5,779,000
Gold (oz.)	254,000	8,882,000	241,000	8,419,000
Sand and gravel	7,689,000	5,080,000	10,782,000	8,651,000
Tin concentrate	?	106,000	?	221,000
Other minerals	1,732,000	...	3,232,000
Total		\$24,252,000		\$26,302,000

250,000,000 leks), including 3,802,000,000 leks (5,437,000,000 leks) invested in the national economy. Monetary unit: *lek* with official exchange rate, high and fictitious, of 50 leks to the U.S. dollar.

Foreign Trade.—Estimated imports in 1952: 908,700,000 leks. Main sources of imports: U.S.S.R., Czechoslovakia, Rumania, Poland. Main imports (1952): machinery, textiles, petroleum products, wheat (30,000 tons), maize (20,000 tons), cement (18,000 tons), paper (13,000 tons), window glass (60,000 sq.meters). Main exports: crude oil, pig copper, chrome ore.

Transport and Communications.—Roads (1949): 1,766 mi. Licensed motor vehicles (Dec. 1950): cars 500, commercial 1,240. Railways (1951): 81 mi. linking Duresi (Durazzo) with Tirana and Elbassan via Kavaja-Peqini. Telephones (1954 est.): 1,700. Radio receiving sets (1950): 40,025.

Alberta. Most westerly of Canada's prairie provinces, Alberta, formerly a part of the Northwest Territories, was created a province by parliament in 1905. Area: 255,285 sq.mi., of which 6,485 sq.mi. are water. Pop.: June 1, 1955 (official figures), 1,066,000. Largest city: provincial capital, Edmonton, pop. (1955 official figures) 209,353, metropolitan area 229,000. Second largest city: Calgary, pop. (1955 official figures) 168,840, metropolitan area 180,000.

History.—Following a bitterly contested election in June 1955, the Social Credit government was again returned to power with a loss of 15 seats, the majority to the Liberals; the new executive was comprised of Ernest Manning, premier, minister of mines and attorney general; W. W. Cross, minister of health; A. J. Hooke, municipal affairs and provincial secretary; G. E. Taylor, railways, telephones and highways; A. O. Aalborg, education; L. C. Halmrast, agriculture; N. A. Willmore, lands and forests; R. D. Jorgenson, welfare; E. W. Hinman, provincial treasurer; J. Hartley, public works; F. C. Colborne, minister without portfolio; R. Patrick, economic affairs; R. Reiersen, industries and labour.

During the pre-election campaign, government supporters reiterated the statement that Alberta was the first Canadian province in a position to pay off all debts if it desired and that revenues from oil fields approximating \$100,000,000 annually might eventually be adequate to eliminate municipal and school taxes. The continued improvement in the over-all economic position of the province was due primarily to oil which was not only supporting the provincial treasury but was providing employment for more than a quarter of the provincial population and promoting the erection of numerous office buildings. A special Gas Resources Preservation Act Amendment act was enacted at the first sessions of the thirteenth legislature which prevents the board from granting a permit for removal of gas unless the gas "in the opinion of the Board is surplus to the present and future needs of the Province."

Education.—Latest available revised statistics for provincially controlled elementary and secondary schools were: school enrollment, June 30, 1954, 201,420. Estimated enrollment June 30, 1955, 214,000; estimated teachers, June 30, 1955, 8,191. Estimated school grants (for operation) for 1955-56 fiscal year, \$25,760,000. Estimated grants for new school buildings, \$4,500,000.

Public Health and Welfare.—There was no recurrence of the polio epidemic which took such a severe toll in 1954. Latest available statistics for hospitals were (1954): hospitalization expenditures \$15,335,816; medical service and hospital construction grants \$1,677,354; (1955) hospitalization estimate \$19,100,000; medical service and construction grant estimate \$2,000,000. In 1954 public welfare expenditure amounted to \$8,632,815 to 11,900 recipients.

Transportation and Communication.—During 1954 1,880 mi. of roads were surfaced and 3,325 mi. gravelled. Cost of main and secondary provincial highways was \$27,500,000; Trans-Canada highway \$3,500,000; cost of 1955 program, \$6,000,000. Number of airports, 34. There were in 1954 approximately 175,000 radios. Latest telephone statistics (1951) listed approximately 165,000 instruments. On Sept. 30, 1955, there were 115,344 trucks and 222,778 cars in operation.

Banking and Finance.—Bank clearings, 1954, were \$4,584,000,000. The provincial budget for 1954-55 was \$157,315,000; estimated expenditure \$156,950,000, and estimated surplus \$365,000. Cumulative revenues from oil royalties, lease and development at March 31, 1955, were \$364,000,000. The provincial funded debt, March 31, 1955, was \$91,781,000.

Agriculture.—The estimated farm value of total 1954 agricultural production was \$556,946,000. The 1954 crop (est.) was: wheat \$131,100,000, oats \$48,100,000 and barley \$67,900,000. Livestock value: cattle \$86,868,000, sheep \$1,986,000, hogs \$87,823,000. Dairy products amounted to \$36,629,000.

Fisheries, Fur and Forestry.—The 1954 fisheries production (value as marketed) was \$1,149,502. During 1954-55 trappers disposed of furs valued at \$2,078,381, while fur farms produced pelts worth \$2,504,556. The entire fur trade continued to languish. The increasing scarcity of wild fur bearers together with the depressed prices had a serious effect on both white and Indian trappers. Total value of lumber, cordwood and other products for 1954 amounted to \$17,761,000.

Manufacture and Industry.—Ninety manufacturing firms which began operations in 1954, or which were under construction to begin operations in 1955, represented approximately \$94,000,000 and provided work for 2,300 people. In 1954 the estimated gross manufacturing value was \$567,360,000, while the estimated retail trade was \$970,000,000. Approximately 31,000 employees were employed by 2,209 manufacturing plants in 1954.

Minerals and Mining.—Coal production declined from \$32,100,000 in 1953 to \$26,600,000 in 1954. Crude oil production rose from \$200,500,000 to \$238,600,000 in the same period. In 1954 crude oil production comprised 87,713,855 bbl. and natural gas production was 135,545,000 cu.ft. Total value of 1954 mineral production was \$284,461,638. (P. H. GL.)

Algeria. A French territory of North Africa, Algeria is situated between Morocco (west) and Tunisia (east), with the status of government-general of the French Union. Total area: 846,124 sq.mi., administered in two parts: northern Algeria (80,919 sq.mi.), comprising the overseas *départements* of Algiers, Oran, Constantine and Bône, and the four territories of southern Algeria (765,205 sq.mi.). Pop.: (1948 census) 8,681,785 including 816,993 (9.4%) in the southern territories; (1954 est.) 9,531,000. Arabs and Berbers, who are Moslem, constitute 86.7% of the population; Europeans, predominantly Roman Catholic, 11.5%; Jews 1.8%. Administration: Algerian assembly, 120 members elected by two colleges (first college, all citizens of French status and Moslems distinguished by military, university, administrative or judicial qualifications; second college, all other Moslem citizens). The assembly manages Algerian affairs in agreement with the governor general, who has wide powers. Chief towns (1948 census): Algiers (cap.) 266,165; Oran 244,594; Constantine 80,233; Bône 77,675; Sidi-bel-Abbès 52,881; Mostaganem 50,403; Tlemcen 50,272. Governor general in 1955, Jacques Soustelle.

History.—Terrorism came to an end in Tunisia (*q.v.*) with the conclusion of the Franco-Tunisian agreements, but spread over Algeria, particularly over the eastern region (the *département* of Constantine), where attacks on isolated farms and assassinations of Frenchmen and of certain Moslems became almost daily occurrences.

On Jan. 26, 1955 the former minister Jacques Soustelle, a Gaullist deputy, was appointed governor general of Algeria. On Feb. 4 the national assembly decided that a state of emergency existed in certain zones and that travel and the right of assembly should be restricted. In April and in May terrorism spread throughout the zone between Constantine and Philippeville, farms were burned, vines cut down, telegraph wires severed, settlers massacred. In the south, near Tebessa and near Biskra, administrative outposts were attacked and an administrator was murdered. The government ordered the dispatch to Algeria of ten battalions of infantry and eight squadrons of *gendarmes*. On June 18 there was a wave of attacks in Philippeville. French and Moslem civilians were murdered by the rebel bands, whose usual weapons seemed to be bombs and razors.

In July it was decided that the administration had to be reorganized. A fourth Algerian *département* was created, consisting of the eastern part of the former *département* of Constantine, with Bône as its capital and Souk-Ahras, Guelma and Tebessa as subprefectures. Specially qualified officers of the

Moslem administration had already been sent to pacify the Aurès mountains, where insurrection had first broken out.

Later eleven new subprefects for Algeria were appointed, including five Moslems.

On Aug. 20 there was a new outbreak of violence in the Constantine and Philippeville region. In September there were about 120,000 men under arms in the French forces in Algeria, and order was being restored. The official casualty list for the period from Nov. 1, 1954, to Sept. 30, 1955, numbered 106 European and 347 Moslem civilians killed by the rebels, 317 officers and other ranks killed by them and 2,176 rebels killed.

These disturbances were reflected on the political plane. On Sept. 26 the majority of the deputies in the second (*i.e.*, Moslem) electoral college, which had hitherto supported the policy of assimilation to France, declared itself in favour of "the idea of Algerian nationality." The Algerian assembly was adjourned. On Sept. 30 the assembly of the United Nations put the Algerian question on its agenda. On Oct. 18 the French government secured a majority in the national assembly in Paris with an undertaking to implement in full the statute of 1947, to raise the standard of living and to hold free elections. (*See* also FRENCH UNION.) (Hu. DE.)

Education.—Schools (1953-54): primary (French and Moslem) 2,369, pupils 410,627; secondary (French only) 44, pupils 31,196 (pupils at higher Moslem schools 631); teachers' training schools 6, students 1,039; vocational (1952) 130, pupils 17,074. Institutions of higher education 4, including 1 university with 5,149 students in 1953-54.

Finance.—Budget (1954 actual): balanced at 150,000,000,000 fr. including an allocation of 40,000,000,000 fr. from metropolitan France. Algerian franc=metropolitan franc. U.S.\$1=350 fr.

Foreign Trade.—(1954) Imports 217,738,000,000 fr. of which 172,000,000,000 fr. from metropolitan France; exports 140,355,000,000 fr., of which 102,000,000,000 fr. to metropolitan France. Production (metric tons, 1954): wheat 1,300,000; oranges, etc. 318,000; dates 105,000; figs (1953) 102,000; iron ore 2,928,000; wine 19,300,000 hectolitres.

Allergy. Much work was done during 1955 to broaden the scope of allergy. On the experimental side, additional light was thrown on the basic immunologic principles involved in antigen-antibody reaction. Allergic manifestations are based on an antigen-antibody reaction. Research work was done on a method of production of antibodies, on the life duration of antibody and on the nature of antigen. Attempts were made to separate the antigenic fractions of many proteins. There was

more and more evidence that antigen-antibody union leads to liberation of a histamine-like substance which is responsible for symptoms in many forms of allergy. Other substances, particularly acetylcholine, are also involved. Clinical investigations on collagen disease of which periarteritis nodosa is an example were also carried out, indicating the possible allergic nature in, at least, some instances. There was also an attempt to reveal the immunologic nature of blood vessel lesions as a result of experimental sensitization.

The role of ACTH and cortisone in clinical allergy was clarified. Additional work was done on the use of hydrocortisone in the treatment of allergic diseases. These hormones were found to be helpful in the treatment of acute allergic emergencies, such as severe intractable asthma, nasal allergy, severe

cases of angioedema and urticaria. The administration of these preparations helps to encourage the patient and helps him over the period during the course of which a complete allergic survey may be done. The administration of these drugs is not without danger. Patients should be studied carefully before these drugs are given and watched continuously during the period of drug administration. Many reports were available of patients who had received these drugs over a long period of time without any serious effects. However, hormone therapy of this type is not considered a substitute for the proper and adequate study and management of the allergic patient.

Several new products were developed, particularly prednisolone and prednisolone. These synthetic products compare respectively to cortisone and hydrocortisone. They have the advantage over cortisone and hydrocortisone as well as ACTH in that they do not lead to salt retention and therefore to accumulation of water. Their administration does not necessitate a salt-free diet and the concomitant administration of potassium chloride. Roughly, about 10% of the patients receiving these products developed side reactions. A great deal of work was also done in developing functional tests for pulmonary function. These were used in conjunction with determining the effectiveness of various drugs in relieving asthma.

Thrombocytopenic purpura and certain forms of anaemia were shown to be caused by a new mechanism as a result of allergy to certain drugs. Whenever a patient develops unusual manifestations during the course of treatment for any condition, drug administered to the patient for the relief of his symptoms may be responsible for the symptoms.

Many additional antihistaminic agents were produced during the year; because the average allergic person appears to develop a tolerance to an antihistaminic drug, it is frequently necessary to change from one drug to another. Some of these drugs were found to produce a sedative type of action, and for that reason were used especially at night. They were particularly helpful in the symptomatic treatment of urticaria and nasal allergy, but were of little help in the symptomatic treatment of asthma. (L. H. C.)

Aluminum. World production of aluminum in 1954 was about 13% greater than in 1953. All major producing countries except Switzerland showed increases. As in 1953, the U.S., Canada and the U.S.S.R. supplied 78% of the total. Most of the increase was in the United States, with Germany, Norway, Japan and Canada showing smaller increases.

United States.—Data on the domestic industry, reported by the U.S. bureau of mines, are summarized in Table II.

Output of primary aluminum in the first nine months of 1955 totalled 1,156.693 short tons, an increase of more than 6% over production in the first nine months of 1954. The new reduction plant of the Anaconda Aluminum company at Columbus Falls

GRAIN OF RAGWEED POLLEN, photographed through an electron microscope in 1955. In actual size the pollen is about one-fifth the diameter of a human hair

ALUMINUM PLANTSITE at Columbia Falls, Mont., opened Aug. 15, 1955, by the Anaconda Aluminum company, the first to enter the field of primary aluminum production in the U.S. since 1946. A capacity of 120,000,000 lb. annually was expected from the new plant

Mont., with a rated capacity of 60,000 tons annually, began producing in August. This made a total of four producers of primary aluminum in the United States. (F. E. H.; B. B. M.)

American Citizens Abroad. United States consular representatives estimated that there were 516,903 American citizens residing in various foreign countries as of Jan. 1, 1955, which reflected a decrease of 41,382 as compared with the previous year. The largest decrease in the American population abroad occurred in Europe and

Estimate of U.S. Citizens Residing Abroad

	Jan. 1, 1954	Jan. 1, 1955	Change
South America	40,210	41,301	+ 1,091
Mexico and Central America	57,769	53,317	- 4,452
Europe	168,732	139,657	-29,075
Asia	65,316	51,398	-13,918
Africa	15,926	14,844	- 1,082
Australia and New Zealand	5,432	5,998	+ 566
West Indies and Bermuda	17,897	24,639	+ 6,742
Canada, Newfoundland and Iceland	155,948	157,367	+ 1,419
Philippines	31,055	28,382	- 2,673
Totals	558,285	516,903	-41,382

Asia, in which areas 42,993 fewer Americans resided at the beginning of the year. As shown by the table, however, a gain of 6,742 was reported for the West Indies and Bermuda.

Many of the American citizens who were residing abroad had received passport facilities for their foreign travel during the tenure of Mrs. Ruth B. Shipley as director of the passport office. Mrs. Shipley retired on April 30, 1955, after having directed the country's passport activities for 27 years. She was succeeded by Miss Frances G. Knight, a career federal employee who was formerly assistant deputy administrator of the bureau of security and consular affairs in which capacity she was closely associated with the work of the passport office.

American Library Association. The American Library association (A.L.A.) the official organization for librarians in the United States and Canada, had a membership in 1955 of approximately 20,000 from the U.S. and possessions, Canada and more than 50 other countries. In 1955, the association had an endowment capital of approximately \$2,460,000 and a total income of about \$1,170,600.

Headquarters are located at 50 East Huron street, Chicago 11, Ill., with David H. Clift as executive secretary. The work of the association is carried on by a staff of 95, assisted by more than 700 members of voluntary boards and committees. The annual midwinter meeting of the association was held in Chicago, Feb. 1-5, 1955. There were 4,500 registered at the 74th annual conference in Philadelphia, Pa., July 3-9. Future conference plans called for a midwinter meeting in Chicago, Jan. 31-Feb. 4, 1956, and annual conferences in Miami Beach, Fla., June 17-23, 1956, and in Kansas City, Mo., June 23-29, 1957.

Officers, elected by ballot, who assumed their duties at the 1955 annual conference were: president, John S. Richards, Seattle (Wash.) Public library; first vice-president and president elect, Ralph R. Shaw, graduate school of library service, Rutgers university, New Brunswick, N.J.; and second vice-president, Mrs. Frances L. Spain, New York Public library. The treasurer was Raymond C. Lindquist, Cleveland (O.) Public library.

The annual A.L.A. citations for distinguished service as library trustees were awarded to Mrs. George R. Wallace, Fitchburg, Mass., and Ralph D. Remley, Rockville, Md. The 34th Newbery medal was given to Meindert DeJong for *The Wheel on the School*, judged to be the most distinguished children's book of 1954. Marcia Brown received the Caldecott medal for *Cinderella*, chosen as the best illustrated children's volume of the year. Emerson Greenaway, director, Free Library of Philadelphia, received the Joseph W. Lippincott award (\$500) for distinguished service in the profession of librarianship. The Margaret Mann citation was given to Seymour Lubetzky, consultant on bibliographic and cataloguing policy, Library of Congress, for his contribution in the field of cataloguing and classification. Maurice F. Tauber, Melvil Dewey professor of library service, Columbia university, received the Melvil Dewey medal for creative professional achievement both as a librarian and as a teacher. The E. P. Dutton-John Macrae award (\$1,000) for advanced study in the field of library work with children and young people went to Mrs. Barbara Davis Widem, assistant librarian, Center for Children's Books of The University of Chicago.

The Grolier Society award (\$500) was presented to Mrs. Charlemae Rollins, children's librarian, Chicago Public library, for her outstanding contribution to the reading of young people. Helen M. Harris, librarian, Lawson McGhee library, Knoxville, Tenn., received the *Letter* librarian award (\$100) for her exemplification of the best traditions of library service. The Kentucky Library Extension division was given the *Letter* librarian award (\$100) for its contribution in extending "the number and degree of an informed citizenry in the State of Kentucky through placing nearly 100 bookmobiles in service. Arthur and Elizabeth Rose of Pennsylvania State college were awarded the Oberly Memorial award, presented every other year for the best bibliography in the field of agriculture and related sciences for their scholarly and valuable work, *Distillation Literature Index and Abstracts 1946-52*.

Thirteen libraries were winners of the 1955 John Cotton Dana Publicity awards, sponsored by the *Wilson Library Bulletin* and the A.L.A. Public Relations committee for effective public relations programs.

The year 1955 saw many A.L.A. projects completed and t

authorization for the beginning of new ones. Notable among the latter was a management survey of the association, conducted by the firm of Cresap, McCormick and Paget, which was accepted by the A.L.A. council. A grant of \$30,000 was given to the Association of College and Reference Libraries, a division of A.L.A., for the support of liberal arts college libraries throughout the country.

Grants from the Fund for Adult Education enabled the association to continue the American Heritage project, whose staff during its four years of operation trained a total of 1,153 discussion leaders with 16,753 people participating in 1,063 groups all over the country. The experience gained resulted in the establishment in the fall of 1955 of the Library-Community project, also financed by the fund. This new project was to be concerned with the establishment of a program of adult education in four pilot libraries in Kansas, Maryland, Michigan and Tennessee.

Hearings were held before the committee on education and labour of the U.S. house of representatives in connection with the A.L.A.-sponsored Library Services bill, which was reported favourably out of the house committee in July and was to be presented to congress when it convened in Jan. 1956. The A.L.A. endorsed the School Library Bill of Rights, which was adopted by the American Association of School Librarians, and accepted the *Library's Pay Plan: A Statement of Principles*, which was prepared by the A.L.A. Board on Personnel administration. The association also was concerned with revising the standards for public and school libraries, recruiting and training able men and women for the profession, and developing worthwhile reading habits for children and adults. (See also LIBRARIES.)

(D. H. C.)

American Literature. The year 1955 brought little to startle and less to gladden the discriminating American reader. He was, as in past years, bombarded by facts and opinions of varying degrees of reliability and, to judge by the popularity of Rudolf Flesch's *Why Johnny Can't Read* and F. L. Ilg and L. B. Ames's *Child Behavior*, had decided that his best hope was to solve his children's problems and to let them settle the world's. The material presented to him by writers on foreign and domestic matters was perhaps more varied and more freely expressed than in the last few years, and less charged with nostalgia for the past and hysteria about the present.

The fiction of the year was undistinguished. Although there were some competent and interesting novels, the most obvious trend was toward a used-up naturalism which had neither individuality of style nor inherent value of content. In the unfortunately sparse output of short stories the reader could find some good writing and sharp perceptions of the surrounding world. If he wanted poetry, there was much from poets both new and established.

The Foreign Scene.—Of books about the world outside the United States, John Gunther's *Inside Africa* was one of the most popular. Narrower in scope and more intense was *Black Power*, Richard Wright's report on the Gold Coast. Harrison E. Salisbury concentrated on the daily life of the Russian people in *American in Russia*. Marston Bates, in his lively book *The Prevalence of People*, discussed the general problem of world population versus resources. And Carleton Coon, as anthropologist, archaeologist and ethnologist, attempted to trace man's growth from prehistoric times in *The Story of Man*.

Several books studied the facts and implications of the foreign policy of the United States. Frank Tannenbaum, in *The American Tradition in Foreign Policy*, suggested that it was in the American tradition to support international ideals at any cost. Louis Joseph Halle, in *Civilization and Foreign Policy*, supported the idea that to survive, nations must get along.

Edwin O. Reischauer's *Wanted: An Asian Policy* recommended ideological rather than military strategy.

The American Scene.—Two provocative studies of American culture were Erich Fromm's *The Sane Society* and Lewis Mumford's *In the Name of Sanity*. Fromm, using a broad psychiatric approach, found the whole contemporary standard of mental health false and proposed sweeping economic, social and moral changes; and Mumford, making a somewhat similar analysis, plead for unconditional world co-operation. Samuel A. Stouffer's *Communism, Conformity and Civil Liberties* concluded on the basis of statistical samplings that hysteria was becoming less acute. *Government by Investigation*, by Alan Barth, and *Grand Inquest*, by Telford Taylor, both defended the principle of government investigation but recommended protective reforms. Gordon Harrison, in *Road to the Right*, reported on conservatism from feudalism to Eisenhower. William O. Douglas' *An Almanac of Liberty* was a group of thoughtful essays and historical notes on civil rights. Richard L. Neuberger's *Adventure in Politics* was a lively discussion of states' rights and other political matters.

A basic source book for future economic studies was *America's Needs and Resources, a New Survey*, by J. Frederic Dewhurst and associates, an estimate of future production, labour force and consumer habits. In a more specific study Benjamin Fine's *1,000,000 Delinquents* collected case studies as well as suggestions on diagnosis, prevention and treatment. A forceful book was Charles Abrams' *Forbidden Neighbors*, which reported on race prejudice in housing, both public and private. C. Vann Woodward, in *The Strange Career of Jim Crow*, followed the story of segregation from pre-Civil War times to the present.

Books about less controversial aspects of American life included *American Skyline, the Growth and Form of Our Cities and Towns*, by Christopher Tunnard and Henry Hope Reed. Eric Russell Bentley's *The Dramatic Event* traced the Broadway theatre from 1952 to 1954. Wyman Richardson's quiet and scientific essays on nature as observed on Cape Ann, Mass., appeared in *The House on Nauset Marsh*. Gilbert Chase, in *America's Music, from the Pilgrims to the Present*, made a scholarly survey of all musical forms. *Charles Ives and His Music*, by Henry and Sidney Cowell, showed the influence of transcendentalism and New England village life on the composer. Van Wyck Brooks's *John Sloan: A Painter's Life* was less a critique than an affectionate reminiscence. Rockwell Kent's discursive *It's Me, O Lord* was a lengthy autobiography of a man whose activities touched on much of America's cultural life for many years. Benjamin Albert Botkin collected city folklore in *Sidewalks of America*. A striking book, edited by Nat Shapiro and Nat Hentoff, *Hear Me Talkin' to Ya*, told the story of jazz in the recorded conversations of more than a hundred of the men who made it. Roland Gelatt presented his enormous research into social history in an entertaining style in *The Fabulous Phonograph; From Tin Foil to High Fidelity*.

Historical Works.—The year was marked by the appearance of the last volumes of two major biographies whose authors died before the work could be completed. *Patriot and President*, a study of the years 1783-1793, was volume vi of Douglas Southall Freeman's *George Washington: A Biography*. This monumental work, if completed, would have included one more volume. J. G. Randall's *Lincoln the President: Last Full Measure*, appeared as the final volume of the work, finished by Randall's close associate, Richard Nelson Current.

A number of interesting works focused on the early days of the country. Wallace Notestein's *The English People on the Eve of Colonization* surveyed the customs and institutions of the people from whom the American colonists came. In *The Coming of the Revolution, 1763-1775*, Lawrence Henry Gipson studied

the trend toward revolution in the colonies. *From Lexington to Liberty*, by Bruce Lancaster, told the story of the American Revolution in homely detail. *Rebels and Democrats*, by Elisha P. Douglass, gave a picture of the struggle for equal political rights and majority rule during the Revolution. *The Washington Papers*, selected from his public and private writings by Saul K. Padover, showed the first president as a democratic human being. Volume x, June 22 to Dec. 31, 1786, of *The Papers of Thomas Jefferson* was issued, under the editorship of Julian P. Boyd, assisted by Mina R. Bryan and Frederick Aandahl. Two popular accounts of lesser known episodes in history were given in Marion Lena Starkey's *A Little Rebellion*, the story of Shays' rebellion, and Glenn Tucker's *Poltroons and Patriots*, a two-volume study of the War of 1812.

Richard Nelson Current's *Daniel Webster and the Rise of National Conservatism* analyzed the Whig statesman's economic thought in relation to his age. In *Andrew Jackson: Symbol for an Age* John William Ward concentrated more on the beliefs of the age than on the actual biography. *The Jacksonians*, by Leonard Dupee White, was the third and final volume in an administrative history of the United States from 1789 to 1861.

Hudson Strode, drawing upon private letters from the Davis family, wrote an excellent biography, *Jefferson Davis: American Patriot 1808-1861*. Other books on the Civil War era included Earl Schenck Miers' *The Web of Victory; Grant at Vicksburg* and James Alonzo Bishop's *The Day Lincoln Was Shot*, a sometimes more dramatic than accurate account of the single day's events.

Harry Barnard, in *Rutherford B. Hayes, and His America*, wrote a carefully documented psychological and political study of the Hayes administration. Two volumes of memoirs supplied interesting source material on the present century. *The Lowering Clouds 1939-1941* was volume iii of *The Secret Diary of Harold L. Ickes*, and *Year of Decisions*, volume i of the memoirs of Harry S. Truman, covered the former president's first year in the White House.

Fiction.—The middle-aged masters dominated fiction in the year 1955, both old and young masters being almost mute. The general monotony of the year's fiction was seldom relieved by the sure voice of the experienced artist or the uncertain experiments of the novice. Although there were novels, some of them competent, on a great variety of themes, the two characters most favoured for dissection were American businessmen or young ladies uncertain of their identity.

Robert Penn Warren's *Band of Angels*, while it discussed problems of freedom and history through the adventures of a white girl who discovers she is a slave, in many ways resembled a standard historical romance of the old south. Herman Wouk's *Marjorie Morningstar* went through much duller adventures and arrived at even more conservative conclusions. Harvey Swados combined both of the year's two favorite type-characters in *Out Went the Candle*, dealing more perceptively and ironically with the businessman father than with the confused and searching daughter. Both Swados and Wouk used a Jewish background for their stories. James Yaffe, in *What's the Big Hurry?*, also concerned with the life of a Jewish businessman, managed better to convey some of the richness and contradictions of this setting. John P. Marquand presented the genteel history of a businessman's hypocrisy and success in *Sincerely, Willis Wayde*. Sloan Wilson's *The Man in the Gray Flannel Suit* anatomized the businessman in suburbia. In contrast to the sometimes pedestrian and sometimes reverent approach of many of the foregoing books was Ring Lardner Jr.'s *The Ecstasy of Owen Muir*, a sharp and often successfully funny satire of a man who adopts a succession of philosophical positions and reduces each to absurdity.

A good, quiet novel was Gerald Warner Brace's *Bell's Landing*, which described the effect of an old Cape Ann house on brothers. A New Yorker returns to his home town and analyzes the Shinto tradition of the south in Hamilton Basso's *The View from Pompey's Head*. Violence characterized a group of books. Robert C. Ruark's *Something of Value*, about the Mau Mau rising in Kenya, had little more than its violence to distinguish it. Budd Schulberg's *Waterfront* was an indictment of waterfront racketeering. *The Goodly Seed*, by John Wyllie, was an exciting story of the clash of personalities, both Japanese and American, in a Japanese prison camp. Mario Puzo, in *The Death Arena*, told of cruelty, weakness and violence against the background of U.S.-occupied Germany. Evan Hunter found his material in New York vocational schools for the sensational *Blackboard Jungle*. And MacKinlay Kantor used the horrors of a Confederate prison for *Andersonville*.

George R. Stewart, with his customary quiet skill, wrote *Years of the City*, not exactly a novel, but the story of the cycle of an imaginary Greek city. William Gaddis' *The Recognition* made a lengthy study of falseness. Merle Miller's excellent story *Reunion* described the tensions and reactions of wartime comrades meeting again years later. Jo Sinclair's *Two Changelings* chronicled a crisis in a neighbourhood becoming interracial. In William Krasner's *North of Welfare*, set in East Harlem, the pictures and character studies were more important than the plot. William Gardner Smith's *South Street* was a fine portrait of a Negro community. Martha Dodd, in *The Search for Light*, observed the effects of a loyalty investigation on a college campus. Calder Willingham's *To Eat a Peach* demonstrated a surer than average sense of style in a story about a southern summer camp. Milton Lott's *The Last Hunt* vividly portrayed the slaughter of the American buffalo.

The sense of style and the richness of content so often missing in the novels of the year appeared more frequently in the short-story collections, many of them written by lady southerners. Of these Eudora Welty's *The Bride of the Innisfallen* was especially good. Shirley Ann Grau, though limited in range, demonstrated her competence in *The Black Prince*. Flannery O'Connor's *A Good Man Is Hard to Find* showed perception of both evil and humour. Frances Gray Patton's *Good Morning, Mr. Dove* was a group of excellent stories. Jessamyn West, a lady not a southerner, in *Love, Death and the Ladies' Drill Team* presented portraits rich in humour and understanding of characters in a southern California setting. Elizabeth Enright's *The Moment before the Rain* was a group of stories about troubled children and adolescents. In *The Worcester Account*, Sam Nathaniel Behrman collected reminiscences about childhood of a minority group. Samuel Hopkins Adams' charming *Grandfather Stories* pictured early days in upstate New York.

Scholarship.—The year saw major publications about America's two great poets, Emily Dickinson and Walt Whitman. The celebration of the hundredth anniversary of *Leaves of Grass* resulted in a number of books about Whitman and editions of his work. The most outstanding was Gay Wilson Allen's *The Solitary Singer*; solid and unromantic in its approach, it for the first time brought together the incredibly scattered and difficult record of the poet's life and work in a scholarly and critically definitive biography. In *Walt Whitman Reconsidered* Richard Volney Chase gave a detailed analysis of the major works and a study of the poet's alienation from his culture. *Leaves of Grass One Hundred Years After*, edited by Milton Hindus, included new essays by William Carlos Williams and others.

The other major event was *The Poems of Emily Dickinson*, edited by Thomas Herbert Johnson, in the first three volumes of what was to be the definitive edition of her complete writings. A monumental work, it includes all variant readings and thorough

a meticulous study of the manuscripts establishes for the first time a canon and chronology of the poems. Johnson focused the vast amount of biographical material he examined in the course of editing the poems into *Emily Dickinson: An Interpretive Biography*, a critical study of her poetry as well as a study of her relationships with her family and, through Colonel Higginson, the Reverend Charles Wadsworth and Helen Hunt Jackson, the outside world. Two books by Millicent Todd Bingham were *Emily Dickinson's Home*, the letters of Edward Dickinson and his family with documentation and comment, and *Emily Dickinson, a Revelation*, Mrs. Bingham's account of her investigation of the poet's love for Judge Otis Phillips Lord of Salem.

Edward Hoffman Rosenberry in *Melville and the Comic Spirit* persuasively argues that Melville's genius was initially and essentially comic rather than tragic. Hyatt H. Waggoner's *Hawthorne, a Critical Study* offered a detailed analysis of Hawthorne's allegory and images. Charles H. Foster's *The Rungless Ladder* studied Harriet Beecher Stowe's literary career and the genesis of *Uncle Tom's Cabin*. Eric Wollencott Barnes wrote *The Lady of Fashion; the Life and Theater of Anna Cora Mowatt*. In *Howells and the Age of Realism* Everett Carter traced the development of realism in American fiction.

Lionel Trilling in *The Opposing Self* collected a group of his studies of literature and of the relation of the self to society. Philip Wheelwright in *The Burning Fountain* made a philosophical analysis of the language of symbolism. Malcolm Cowley, speaking as a literary elder statesman, described the ideas, habits and working conditions of contemporary writers in *The Literary Situation*. Frederick John Hoffman's *The Twenties* was a serious attempt to survey and assess American writing in the postwar decade. *The Lion and the Honeycomb* was a collection of essays by the distinguished critic Richard P. Blackmur. Two poets published groups of essays: Marianne Moore's *Predilections* were prose writings about poetry; and William Carlos Williams' *Selected Essays* dealt with poetry and the related arts and with the development of a specifically American tradition. *The Chicago Renaissance in American Letters*, by Bernard I. Duffey, told the story of the period from the 1890s to the 1920s. Leon Edel's *The Psychological Novel, 1900-1950* traced the form back to Henry James. Finally, two autobiographies by literary figures were of special interest: *The Woman Within*, Ellen Glasgow's life, showed the growth of a writer in a conservative southern society. Pearl Buck's *My Several Worlds* was interesting both as the story of a writer and as a view of China in a turbulent period.

Poetry.—The voice of the poet was increasingly clear in the land; established poets continued to collect their life work and new poets continued to write in considerable volume. W. H. Auden's *The Shield of Achilles* was a group of new poems, pastoral and devotional, displaying perhaps less pessimism than previous poems. The title poem of Conrad Aiken's *A Letter from Li Po, and Other Poems* discussed the function of the poet and poetry in society. Archibald MacLeish's *Songs for Eve* contained some fine lyric poetry and some criticism of the age. Elizabeth Bishop's *Poems: North and South. A Cold Spring* demonstrated her exact observation of nature.

In *Poems: 1923-1954* E. E. Cummings presented his collected poems. There were volumes of selected poems from Randall Jarrell, Robert P. Tristram Coffin, Mark Van Doren and Kenneth Burke. Rolfe Humphries' *Poems: Collected and New* and John Ciardi's *As If: Poems New and Selected* contained new and collected works.

Poets of Today II continued the successful experiment of publishing the work of several poets in one volume, *The Hatch* by Norma Farber, *The Irony of Joy* by Robert Pack, and *Good News of Death and Other Poems* by Louis Simpson. Other

THE EISENHOWER BROTHERS, a photograph from *The Great American Heritage* by Bela Kornitzer, published in 1955. From left to right: (seated) Arthur, the President and Milton; (standing) Edgar, Earl

books of some distinction by poets new and old were: *The Symbols*, by John Holmes; *The Scarecrow Christ*, by Elder Olson; *Man Now*, by William Burford; *The Second Man and Other Poems*, by Louis O. Coxe; *The Salt Garden*, by Howard Nemerov; *Birthdays from the Ocean*, by Isabella Gardner; *Wilderness Stair*, by Ben Belitt; *Water Ouzel and Other Poems*, by William H. Matchett; and *The Middle Voice*, by Constance Carrier. (See also BOOK PUBLISHING AND BOOK SALES; CHILDREN'S BOOKS; ENGLISH LITERATURE; LITERARY PRIZES.)

Andorra. An autonomous principality between France and Spain, Andorra is bounded north by the *départements* of Ariège and Pyrénées-Orientales and south by the Spanish province of Lerida. Area: 191 sq.mi. Pop. (1953 est.): about 6,500, excluding about 1,200 foreigners, mainly Spaniards; (1954 census) 5,664. Language: Catalan. Religion: Roman Catholic. Capital: Andorra-la-Vieja, pop. (1952 est.) 600. Co-princes: the president of the French republic and the bishop of Urgel, Spain, respectively represented in 1955 by their *viguiers* (deputies), Jean Menant (France) and Jaime Sansa Nequi (Spain). An elected general council of 24 members appoints one of its members as the *syndic général des vallées* (from 1946, Francisco Cayrat).

History.—There was a substantial amount of new housing in 1955 and 15 small hotels were built at Las Escaldas, a tourist centre. But an important source of livelihood was still smuggling, which was the main cause of strained Franco-Andorran relations. Trouble also arose from the decision of the Sofirad (Société Financière de Radiodiffusion), a concern controlled by the French government, to build another transmitter in Andorra. The transmitter was completed, but remained silent, because the Spanish coprince failed to give consent to the venture. Locally-controlled Radio Andorra continued to broadcast.

Economy.—No budget or taxes. Telephone system built and maintained by Radio Andorra (1954, about 100 subscribers). Roads maintained by *Forces Hydro-électriques d'Andorre S.A.* (Fhasa). Cigarette factory with yearly turnover of about 50,000,000 pesetas. Duties collected on imported goods in 1952: about 2,250,000 pesetas. Monetary unit: French franc and Spanish peseta.

Angling. In the fiscal year July 1953 to July 1954, fishing-licence sales in the United States continued their upward trend. A total of 18,580,813 men and women paid a record-breaking \$38,927,735 for all categories of state licences, permits and stamps. Four states had more than 1,000,000 licence holders: California, Michigan, Minnesota and Wisconsin.

The 47th annual tournament of the National Association of Angling and Casting clubs was held at St. Louis, Mo., Aug. 17-21, 1955. The distance trout fly event was won by Jon Tarantino of San Francisco, Calif., with a long cast of 175 ft. and an average of 169 ft. The $\frac{3}{8}$ -oz. bait-casting event was taken by Dick Ward of Washington, D.C., with a long cast of 386 ft. and an average of 368 ft., which broke both records. The $\frac{5}{8}$ -oz. bait-casting event was won by William J. Lovely of St. Louis, Mo., with a long cast of 442 ft. and an average of 427 $\frac{3}{4}$ ft. The distance salmon fly event was won by Myron C. Gregory with a long cast of 212 ft. and an average of 200 $\frac{3}{4}$ ft., which also toppled both records. Ben Fontaine of New Orleans, La., again took the Skish distance fly event, this time with a long cast of 148 ft. and an average of 140 $\frac{3}{4}$ ft.

The 12th International Tuna Cup match was held at Wedgeport, N.S., Sept. 7-9; the Alton B. Sharp cup was awarded to the United States team.

The International Game Fish association announced six all-tackle records. A 21-lb. 6-oz. blackfish was taken on June 12, 1954, off Cape May, N.J., by R. N. Sheaffer. A 90-lb. black drum fell to J. W. Douglass on May 17, 1955, at Wildwood Highland,

N.J. A 2,536-lb. mako shark was caught on April 11, 1955, Denial Bay, Austr., by A. Dean, who broke his own record. A 136-lb. wahoo was taken on April 8, 1955, at East Boynton Inlet, Fla., by R. J. Geyer. A 105-lb. 12-oz. yellowtail was caught by M. A. Yant on April 30, 1955, at Bahia de Tonala, Mexico. *Field & Stream* magazine announced a new fresh-water record for longnose gar, a 50-lb. 5-oz. specimen taken by Townsend Miller on July 30, 1954, from Trinity River, Tex. (A. J. MEYER)

Anglo-Egyptian Sudan.

A country in northeast Africa, the Anglo-Egyptian Sudan was under British and Egyptian control until Feb. 12, 1954, under the joint sovereignty of Great Britain and Egypt; on that date it entered a transitional period of more than three years at the end of which complete independence was to be attained. Area: 967,500 sq.mi. Pop. (1955 census, no census ever taken): 8,764,000.

Language: English, Arabic, and various Nilotic and Nubian tribal dialects in the south.

Religion: in the six northern provinces the Sudanese, a Negroid Hamitic race, are almost entirely Sunni Moslem divided into a few sects; in the three southern provinces, containing one-quarter of the country's population, the Negroes are mainly pagan, but one-fifth is Christian.

Chief towns (pop., 1955 est.): Khartoum (cap.) 827,000; Khartoum North 34,000 and Omdurman 125,300—the three towns constituting in fact one agglomeration divided by the Nile; Niles' joining there; El-Obeid 70,100; Port Sudan 47,400; Wad Medani 57,300.

Governor general in 1955 (responsible to the co-dominion powers for matters of defense and external affairs), Sir Knox Helm; prime minister, Ismail el-Azhari.

History.—On Dec. 28, 1954, the Sudanese cabinet was reconstituted following the dismissal by the prime minister of the previous cabinet ministers. The dismissed ministers had fallen out with the government on the issue of what they felt was the too great domination of Sudanese affairs by Egypt. In accordance with the declared policy of the Sudanese government the prime minister resisted their complaints and continued to advocate close co-operation between Egypt and an independent Sudan. But the deterioration of Sudanese-Egyptian relations was the principal feature of 1955 and before it was over Ismail el-Azhari himself had far exceeded his former colleagues in the expression of resentment of Egyptian methods and his determination not to allow the Egyptian connection to qualify the reality of Sudanese independence.

On March 31 the government National Unionist party (N.U.P.) adopted a resolution in favour of complete independence and of a parliamentary republic. Relations with Egypt, the resolution stated, must not be prejudicial to Sudanese sovereignty. In foreign relations the Sudan must not be tied to one power but should be a member of the Arab league. The public declaration of policy marked an important change in the attitude of the party. It was attributed to resentment at the steady stream of propaganda which was directed from Cairo against the Sudanese people, to the dismissal of Gen. Mohammed Naguib (a Sudanese) and to the Egyptian attitude toward the control and distribution of the waters of the Nile. The extent of the disagreement between the two countries on this last issue became clear when a conference, which met in Cairo on April 6, broke down on the following day and the Sudanese minister of irrigation declared that his government had lost all confidence in Egyptian intentions.

During 1955 the Sudan began to take its place in the world field of international affairs. On April 4 British and Egyptian diplomats, acting as representatives of the two states still

sponsible for the foreign relations of the Sudan, signed an agreement in the United States which provided for extended technical assistance to the Sudan which was to take the form, among other things, of a campaign against malaria under the direction of the World Health organization, and of a program of "fundamental education" by the United Nations Educational, Scientific and Cultural organization.

The Sudan was represented at the Bandung Asian-African conference (*q.v.*) by the prime minister where he was reported as siding, unlike Egypt, with the prowestern group of Asian and African powers.

On June 18 two ministers were dismissed; both advocated union with Egypt and the autonomy of the southern Sudan. Cairo radio continually attacked the prime minister and on July 1 a Sudanese minister declared "A link with Egypt means domination by Egypt." El-Azhari and six members of his cabinet visited Cairo during July 23-28. Later the prime minister said "If we had represented a foreign power the treatment we received would have made us break off relations." On Aug. 16 the Sudanese parliament unanimously adopted a resolution to the effect that Sudanization had been completed and asking that arrangements for self-determination be put in motion forthwith. The prime minister stated that the Sudan desired complete independence but that if the question of a link with Egypt had to be considered he would prefer it should be by a plebiscite rather than by a constituent assembly as provided for in the Anglo-Egyptian agreement of 1953.

On Aug. 22 parliament decided to invite representatives of Czechoslovakia, India, Pakistan, Sweden, Switzerland, Norway and Yugoslavia to supervise the voting, of whichever kind, upon whose outcome the issue of the country's relations with Egypt would depend.

The latent antagonism of the northern and southern Sudan found expression on Aug. 19 when two companies of the Equatoria corps of the Sudan defense force mutinied at Torit, the capital of Equatoria province. At the request of the Sudanese government Sudanese troops were flown to the affected areas by royal air force transports.

The governor general of the Sudan returned from leave in Great Britain and appealed to the mutineers to lay down their arms. The U.K. government rejected a suggestion by the Egyptian government for joint military action by the two co-dominions and by the end of August it appeared that the situation was under government control. (*See also EGYPT.*) (H. S. D.)

Education.—Schools (1953-54): primary (including sub-grade and Koran) 1,636, pupils 168,329; intermediate and vocational 101, pupils 15,343; secondary 23, pupils 4,333; teachers' training colleges 19, students 1,645. University College of Khartoum (July 1954): students 616, teaching staff 94.

Finance and Banking.—Monetary unit: Egyptian pound, with an exchange rate of £E0.975 to the £1 sterling and £E0.348 to \$1 U.S. Budget: (1951-52 actual) revenue £E46,400,000, expenditure £E21,800,000; (1953-54 estimate) revenue £E28,500,000, expenditure £E26,800,000. Total external debt (June 1953): £E10,400,000, of which £E4,700,000 to Egypt for development. Bank deposits (Mar. 1954) £E13,900,000.

Foreign Trade.—(1953; 1954 in parentheses) Imports £E50,776,000 (£E48,492,000); exports £E44,419,000 (£E40,458,000). Main sources of imports (1953): U.K. 41.5%; Egypt 8.2%; India and Pakistan 7.8%; Italy 5.9%; Germany 5.3%; U.S. 2.6%. Main destinations of exports: U.K. 41.9%; India and Pakistan 13.2%; Germany 10.8%; France 6.9%; Italy 6.2%; Egypt 5.5%; U.S. 2.5%. Main exports (1953): cotton 62.2%; cottonseed 7.4%; gum arabic 6.9%.

Transport and Communications.—(1953-54) Railways 3,956 km. Waterways 3,744 km. Motor vehicles in use (1953): cars 6,200, commercial vehicles 7,200. Telephones (Jan. 1954) 11,648.

Agriculture.—Main crops (metric tons 1953; 1954 in parentheses): cotton, lint 87,000 (93,000); cottonseed 165,000 (167,000); broad beans 3,000; chick-peas 1,000; (1953-54) sesame 29,000; peanuts 24,000; dates (1952) 31,000. Livestock (1955 est.): sheep 6,000,000; cattle 5,500,000; goats 5,000,000; camels 2,000,000; horses (Sept. 1952) 20,000; asses (Sept. 1952) 500,000.

Antarctica. The fifth largest continent is separated from the rest of the world by the Antarctic ocean (South Atlantic, Pacific and Indian oceans), whose stormy, pack-ice-filled seas hampered man's effort to complete the coastal outline of Antarctica until 1947. The shores can be reached by ship only during the summer months as the low temperatures in winter cement coastal waters into a solid, impenetrable ice mass.

Less than one-third of the continent's 5,100,000 sq.mi. of land is explored, principally along the coast and a narrow track to the south pole. The known portion has an average elevation of about 5,000 ft. above sea level and is one-tenth snow-covered.

History.—The U.S. navy icebreaker "Atka" left Boston, Mass., in Dec. 1954 for the Ross sea sector of the Antarctic to make a survey of the Bay of Whales and to select sites for bases in connection with U.S. participation in the International Geophysical year 1957-58. Upon reaching the 100-ft.-high Ross Ice Shelf it was found that a huge segment of it had broken off and drifted out to sea, including what was formerly the Bay of Whales (the site of earlier Norwegian and United States expeditions). What remained of the once easy landing area now ended abruptly in a sheer wall of ice. Much equipment, such as five aeroplanes, buildings and food abandoned by the navy in 1947, had drifted out to sea and was lost. A helicopter from the "Atka" crashed while flying under "white-out" conditions and the pilot was killed. Possible sites for bases were later investigated at Okuma and Kainan bays, to the eastward in the Ross sea, where easy access to the interior appeared feasible. In the latter part of Jan. 1955 the "Atka" made attempts to reach the coast of the continent in the Pacific quadrant to obtain needed ground control points for previously recorded aerial photographs taken by the navy in 1947; but the vessel retreated northward because of ice. In Feb. 1955 the "Atka" rounded Cape Horn and entered the Weddell sea in an attempt to reach its head in 78° S. lat. Because of ice, a ship's broken propeller blade and the lateness in the season, further attempts were abandoned and the vessel returned to the United States in April 1955.

Two months earlier, the Argentine icebreaker "General San Martin" had secretly and successfully penetrated the Weddell sea pack ice to reach the Gould bay area where their fifth and southernmost station was established, less than 800 mi. from the south pole. Base General Belgrano was within the Argentine-claimed sector of the Palmer peninsula and was manned by 32 men.

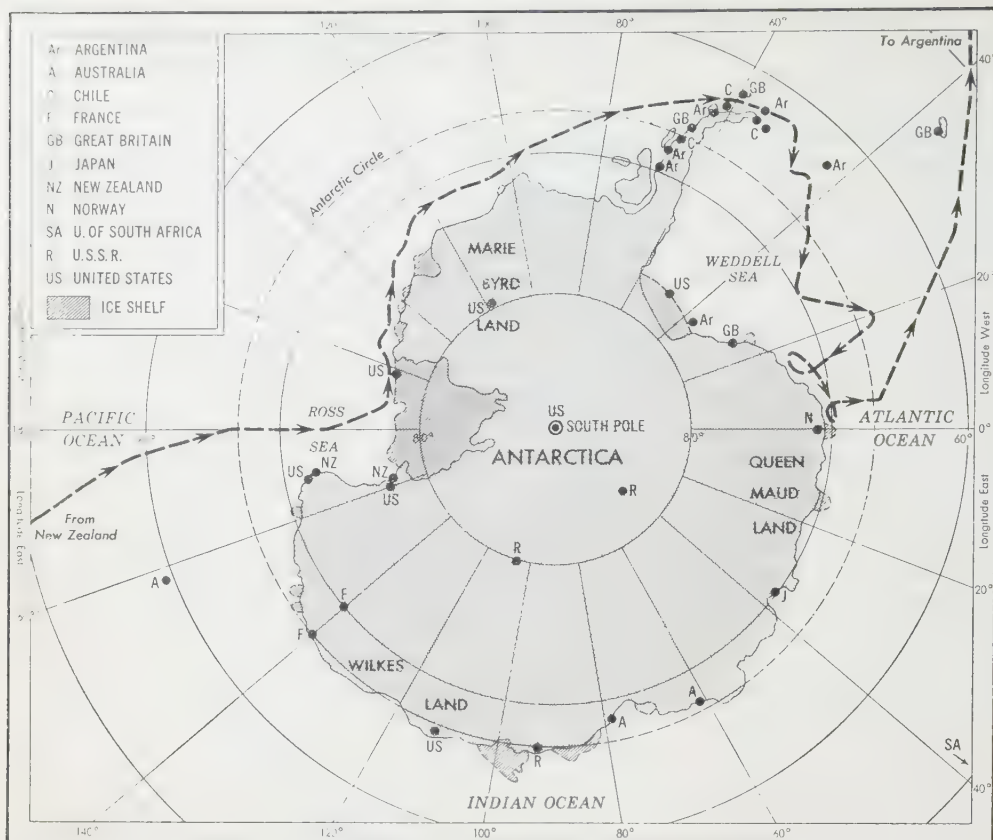

The Argentines announced plans for a transantarctic air-supported tractor journey, via the south pole, to McMurdo sound in the Ross sea in the 1955-56 season, putting themselves in competition with a similar British venture to be launched in Dec. 1956.

When Argentine naval transports were unable to penetrate the last 140 mi. of pack ice in Marguerite bay, helicopters flew a new group of men into the Argentine base and relieved the 19-man garrison which had been marooned for two years.

An additional Argentine base, Camp Esperanza, was set up on the extreme northern tip of Palmer peninsula close to the British Hope bay station.

During the year, the British set up two additional bases at Anvers and Horseshoe Islands in Marguerite bay. Four or five men occupied each base and were engaged in meteorological observations and local survey.

In the disputed Palmer peninsula sector, the British with

ROUTE OF THE U.S.S. "ATKA" during its 1954-55 voyage to Antarctica. Also shown are the bases proposed by the nations participating in the antarctic program of the International Geophysical year, 1957-58

eight, the Chileans with four and the Argentines with five bases maintained continuous occupation to strengthen their rights for sovereignty in an area where those three nations' claims overlapped.

The third International Geophysical year was to be held from June 1957 to the end of Dec. 1958 for the study of earth sciences. In 1882 the first one was held, and the second took place in 1932-33. Eleven nations planned to participate with stations in the antarctic and subantarctic islands to make identical geophysical recordings with those made elsewhere throughout the world. The National Science foundation and the National Research council were jointly sponsoring U.S. participation in the international program, with the navy providing logistic support. Five cargo ships and three icebreakers left for the Ross sea area in Nov. 1955 to set up the main station in the vicinity of the Bay of Whales in the Ross sea. A base for air operations was to be constructed in McMurdo sound at the western head of the Ross sea. From this base, planes would make air-drops to set up one of the field stations at the south pole in Nov. 1956. Tractor-trains would haul supplies to construct another field station in Ellsworth highland at 80° S. lat., 120° W. long. Two additional stations, as part of U.S. obligations in the scientific year, were to be established at the head of the Weddell sea and on Knox coast in the 1956-57 season. Navy Task Force 43 was set up for the purpose of providing logistic support for the program and was in command of Rear Adm. George Dufek, U.S.N. (retired).

At a meeting in Paris in July 1955 the location of the bases of the various nations was determined, with Great Britain, Norway, Chile, France, Belgium, Japan, Australia, New Zealand, Argentina and the Soviet Union participating. (See also EXPLORATION AND DISCOVERY; INTERNATIONAL GEOPHYSICAL YEAR, 1957-58.)

(F. RE.)

Anthropology. The year 1955 marked by the crystallization of two trends whose first indications appeared in earlier years. The first of these was a restatement of the basic unity of the discipline, an attempt to reintegrate the diverse pursuits of anthropologists which had led them into such disparate and apparently unrelated topics as the Ice Age and the prehistoric neme.

The re-evaluation took several forms, depending on the individual interests of the workers, and it is unnecessary to capitulate here all the aspects presented by the various works which displayed this trend. Significant works ranged from Ralph Linton, *The Tree of Culture*, through such diverse books as M. J. Herskovits, *Cultural Anthropology*, W. Barre, *The Human Animal*, W. W. Howells, *Back of Evolution*, and C. S. Coon, *The Story of Man*. The latter works showed

a modification of the basic trend: the interest of the worker in making anthropology both interesting and clear to the general reader, who has no training in the field. In fact, the principal trend of the year seems to have been to attract the interest of scholars working in various branches of the sciences to the central scientific core, so that the science as a whole would have more meaning, and at the same time their work would have more validity because of its broader outlook. Culminating this trend was the publication of the first volume of the *Yearbook of Anthropology—1955*, published by the Wenner Gren Foundation for Anthropological Research. This volume replaced the *Yearbook of Physical Anthropology* and other works published sporadically by the foundation to fill anthropological needs as they arose. The volume, edited by William Thomas, Jr., detailed in its preface the three kinds of readers which it intended to attract: other professional specialists in anthropology, the vast audience of the lay public and students and scholars in disciplines other than anthropology.

Publication, throughout the year 1955, reflected each of these kinds of readers. It also reflected the thinking of previous years; there were prophets who had demonstrated the present trend in years which had gone before, only to be overlooked. Herskovits' earlier *Man and His Works* was a substantial attempt to integrate most of the fields of anthropology, yet it fell short in its broad, general appeal. J. G. D. Clark's monumental *Prehistoric Europe: The Economic Basis* (1952) perhaps displayed the best features of this trend.

Anthropological publication continued to increase, both in variety and in importance. Apart from the inauguration of the *Yearbook*, the year also saw the inception of the regular publication of *Ethnohistory* as a quarterly, of *Western Anthropology* by the Western States branch of the American Anthropological association, *African Abstracts* and the *Davidson Journal of Anthropology*. During the year, the review editor of the American Anthropological association received 480 publications, and 211 books were reviewed in the *American Anthropologist*. T

SURVEY OF THE ANTARCTIC, a series of photographs by Walter Sullivan of the *New York Times*, who accompanied the U.S. navy expedition seeking a site for a base of operations during the Antarctic phase of the International Geophysical year, 1957-58

Top, left: Helicopter leaving the flight deck of the icebreaker "Atka" for an exploratory flight near Little America III, 1939 base of Adm. Richard E. Byrd

Top, right: The "Atka" moored to the ice in Admiral Byrd bay, one of two good sites found for docking the ship on the Atlantic side of the south polar region

Left: A seaman pursuing Adélie penguins across the ice. The expedition brought back several of the birds for the Washington (D.C.) zoo

Bottom, left: Technicians and observers aboard ship and helicopter co-ordinating navigation measurements. This point was determined to be 686 mi. from the pole, the farthest point to the south reached by the expedition

Bottom, right: A U.S. signal corps observer shown after dismantling a wind generator he had mounted during the Byrd expedition of 1934. The radio tower shown buried in the snow was 70 ft. high when erected

represented only a fraction of the books of anthropological interest which were published. It in no way reflected the constantly increasing pressure on publishers and editors by authors of manuscripts both great and small, which complicated the editorial problem. Anthropology as a field had acquired more interested participants, had begun to develop its own integrated core and had reached out to the general public for a measure of understanding.

The second major trend of the year was reflected both in publications and in meetings. Anthropology, no longer an isolated science, had joined other sciences in the attack on common problems, with the idea of solving, by a multidirectional approach, questions which had not been illuminated by previously used techniques. Although many meetings reflected this new trend, two in particular deliberately established the multidirectional approach. The first of these was the international symposium on "Man's Use of the Earth," held in Princeton, N.J., June 16-22, and sponsored by the Wenner-Gren foundation. Its theme—"What has been and is happening to the earth's surface as a result of man's having been on it for a long time, increasing in numbers and skills unevenly, at different places and times?"—was debated by more than 80 participants representing about 21 different disciplines. Representatives came from ten countries and represented universities, private institutions, industry and government. The second international symposium was held in Cambridge, Eng., July 25-30, on the subject of the current status of radiocarbon research. This technique, not originally developed by anthropologists but rapidly accepted by the discipline as one of prime importance, was also accepted by other scientific fields. The conference brought together 30 scientists, including 4 from the United States, to discuss several important aspects of the technique.

There was a subtle difference in the approach of these two congresses. The first attempted to illuminate problems; the second attempted to frame directions for future research.

The Cambridge radiocarbon conference concentrated on three general topics of fundamental importance to the future of radiocarbon research: counting techniques, the geochemistry of carbon 14 and the correlation of recent radiocarbon datings. The conclusion of the assembled scientists was that radiocarbon research was of the utmost importance for several sciences, not only as a technique for dating events but also as a sensitive and valuable tool for determining rates of important processes.

The cross-disciplinary pattern was reflected in several publications during the year. Among these, *For a Science of Social Man*, edited by John Gillin, *Education and Anthropology*, by G. D. Spindler, and *Aspects of Culture and Personality*, edited by F. L. K. Hsu, show the impact of anthropology and other sciences on problems which lie both inside and outside the more conventional anthropological field.

Two series of special conferences were held during the year. The first, sponsored by the Society for American Archaeology under a grant from the Carnegie corporation, consisted of four seminars held in four cities. Gordon R. Willey was chairman of the first of these, held in Cambridge, Mass., on the subject of "Prehistoric Culture Contacts." The second, under the chairmanship of Emil Hauray, concentrated on "Cultural Persistence and Change Through Time." In Santa Fe, N.M., under the co-chairmanship of Jesse D. Jennings and Erik Reed, the seminar considered "The Prehistoric Southwest: A Problem in Cultural Isolation." The final group, under the direction of Richard K. Beardsley, concentrated on "Changing Settlement Patterns in American Cultural Evolution." The results of these seminars were to be published as a memoir of the Society for American Archaeology.

Three conferences of special interest to physical anthropolo-

gists were held during the year: "Dynamic Anthropometry" in New York city in March; "Nutritional Anthropometry" in Cambridge, Mass., in June; and "The Role of Physical Anthropology in the Field of Human Identification" in Washington, D.C., in September. The National Science foundation increasingly supported projects in physical anthropology.

Apart from special conferences and meetings during the year, the period was marked by the continuance of the usual anthropological meetings. The most notable of these was the 11th Pan-African Congress on Prehistory, held in Livingstone, Northern Rhodesia, in July. The conference was preceded by the announcement by Raymond A. Dart of the medical school of the University of the Witwatersrand, Johannesburg, U. of S.A., of a new jaw fragment of *Australopithecus*, which had been found by E. L. Boné in the dump from Limekiln cave at Makapansgat, U. of S.A. This find had particular significance in view of the recent identification of pebble tools from the same site by C. Van Riet Lowe. This appeared to be the earliest association between tool-making and manlike animals. These finds were presented at the congress, where they formed an integral part of the discussion on the relationship of the australopithecine finds to man's ancestry. The general conclusion was that these finds were relatively late in date, and probably not ancestral to living human forms. A wide variety of papers was presented at the congress, of which three deserve special mention. R. S. Mason of the South African Archaeological survey advanced a new method of tool analysis based on statistical computation which would substantially reduce the subjective aspect of much archaeological reporting. C. K. Brain of the Transvaal museum presented a new method of computing the position in the pluvial cycle of any cave deposits, linking with it a magnificent analysis of the process of cave deposition. It was believed that his techniques might go far toward the final solution of the dating of the African material, which, up to now, had hung in chronological limbo. Another paper, by H. S. B. Cooke, presented a remarkably ingenious theory about the relationship of European glaciations and the African pluvials, which offered many ideas for future research. His theories accounted for many of the discrepancies between the two sequences, but failed to account for certain local irregularities.

The congress was preceded by a week's excursion to most of the important sites of Southern Rhodesia. Following the meeting in Livingstone, where the papers were presented, were two further excursions, which permitted the delegates to examine the most important sites of Northern Rhodesia and the Katanga area of the Belgian Congo. It was significant that this congress reflected the general trend of the integration of several sciences around a central theme: in this case, the geological correlation of Africa and Europe and the dating of the Australopithecine.

During the year, a two-year project, "The Southwest Project in Comparative Psycholinguistics," was initiated by the Social Science Research council, to study the relationship between language structure and patterns of thought. Under the direction of John B. Carroll, Harvard psychologist, the first phases of the investigation, involving the collaboration of psychologists, anthropologists and linguists, were planned during July and August. The project was supported by a grant from the Carnegie corporation. The Association of American Medical Colleges concentrated the third of its teaching institutes on anatomy and anthropology, pressing further the interdisciplinary trend.

The Wenner-Gren foundation entered its 15th year of continuing to serve the anthropological profession. The Viking fund medals and awards, presented by the Wenner-Gren foundation, went to Robert Redfield (The University of Chicago), general anthropology; W. Duncan Strong (Columbia university), archaeology; and W. W. Howells (Harvard university),

physical anthropology.

It must be noted that the trends which have been mentioned here were part of a continuum, extending back in time and projecting into the future. The 1955 meetings of the American Anthropological association emphasized this: for the first time, a special session of papers selected from all anthropological disciplines was projected, without competing sessions. In this way, all branches of the science could come together to draw from each other mutual support and inspiration. (See also ARCHAEOLOGY.) (W. S. Gy.)

Arabia. A peninsula of southwestern Asia, Arabia is bounded north by Jordan and Iraq, southwest by the Red sea, southeast by the Gulf of Aden and the Indian ocean and northeast by the Persian gulf and the Gulf of Oman. Area, about 909,681 sq.mi., almost four-fifths occupied by the kingdom of Saudi Arabia (*q.v.*); in the northeast, southeast and part of the southwest coastal regions are the kingdom of Yemen (*q.v.*), the British colony and protectorate of Aden (*q.v.*) and the states listed below. Total pop. (1954 est.) 13,418,000, mostly Arabic-speaking Sunni Moslems.

Muscat and Oman.—This is a sultanate in close treaty relations with Great Britain, occupying regions extending northwest and southwest from the most easterly point of Arabia, together with an enclave in Trucial territory stretching southward for about 45 mi. from Cape Musandam. Area: about 82,000 sq.mi.; pop. (1954 est.) 550,000, including many Baluchis, western Indians and Negroes. The dependency of Gwadar, an enclave on the south coast of Makran (Pakistan) comprises a port (pop. about 5,000) and about 300 sq.mi. of adjoining country. Chief towns: Muscat (cap.), est. pop. 5,500; Matrah, 8,500. Sultan, Said bin Taimur.

Persian Gulf.—The following are British-protected Arab sheikhdoms in the Persian gulf. The headquarters of the British political resident, Persian gulf, is at Manama, Bahrain. Agent in 1955, B. A. B. Burrows.

Bahrain.—This archipelago lies 20 mi. off Al Hasa on the gulf coast of Saudi Arabia. Total area, 231 sq.mi.; pop. (1954 est.) 120,000 (about 50% Shia Moslems). Chief towns (1954 est.): Manama (cap.), pop. 50,000; Muharrek, about 30,000. Sheikh, Sulman bin Hamad al-Khalifah; British political agent in 1955, C. A. Gault.

Katar (Qatar).—Area about 8,500 sq.mi.; pop. (1953 est.) 30,000. Cap.: Doha (or Bida). Sheikh, Ali bin Abdullah al-Thani; British political agent in 1955, W. B. M. Johnston.

Kuwait.—Area, about 8,000 sq.mi.; pop. (1954 est.) 200,000. Cap.: Kuwait, pop. (1952 est.) about 25,000. Sheikh, Abdullah bin Salim as-Subah; British political agent in 1955, C. J. Pelly.

Trucial Sheikhdoms (or T. Oman, T. Coast).—Abu Dhabi, Ajman, Dubai, Fujairah, Ras al-Khaiman, Sharjah and Kalba, and Umm al-Kawain sheikhdoms. Total area, about 5,792 sq.mi.; total pop. (1954 est.) 80,000. Chief towns: Dubai (chief port and British political agent's headquarters); Sharjah; Abu Dhabi (port). British political agent in 1955, C. M. Pirie-Gordon.

History.—The three British-protected oil-bearing states in the Persian gulf (Kuwait, Bahrain and Katar) increased production during 1955 and there was also active exploration of

potential submarine deposits off the Kuwait coast.

In April the British foreign secretary (then Sir Anthony Eden) stated in the house of commons that the new Anglo-Iraqi agreement (see IRAQ) in no way affected the status of Kuwait.

Under the 1954 truce, oil prospecting by the Iraq Petroleum company in the Buraimi zone proceeded peacefully. But in August tension suddenly revived when the Saudi Arabian authorities blocked a British relief convoy for the victims of an extensive fire in the zone; and when in September the arbitration tribunal met, the president and the British delegate quickly resigned in protest against the partiality of their Saudi Arabian colleague. Saudi Arabian bribery in Abu Dhabi, aimed at bringing the sheikhdom into Saudi Arabia's orbit, was also alleged. The outcome was the reoccupation of Buraimi by Arab levies under British officers. Saudi Arabia (*q.v.*) protested strongly.

(O. M. T.)

Production.—Oil production in metric tons for recent years was as shown in the table.

	1951	1952	1953	1954
Bahrain	1,503,000	1,505,000	1,500,000	1,500,000
Katar	2,370,000	3,297,000	4,056,000	4,776,000
Kuwait*	28,226,000	37,637,000	43,284,000	48,575,000

*Including Kuwait Neutral Zone.

Finance and Trade.—*Muscat and Oman.*—Monetary units: Indian rupee (official) valued at 21 cents U.S.; Maria Theresa dollar (common medium of exchange) and (in Dhofur province) half dollar; in interior generally, copper *baiza* (200 *baizas*=1 Maria Theresa dollar=c. Rs. 2.5) with nickel coins for multiples. Foreign trade (1952-53): imports Rs. 24,363,300, exports Rs. 22,817,400; imports from U.K. (1954) £248,170, exports to U.K. (1954) £11,328. Chief imports: cereals, tea, sugar, tobacco, cotton goods. Chief exports: dates (£709,377 in 1952-53), limes, dried fish.

Kuwait.—Monetary unit: Indian rupee. Trade (1954): imports from U.K. £10,173,574, exports to U.K. £134,775,089. Chief exports: petroleum and pearls.

Bahrain and Katar.—Monetary unit: Indian rupee. Foreign trade (1954 including trucial Oman): imports from U.K. £10,732,087, exports to U.K. £16,344,150. Chief exports: rice, petroleum products, pearls. Chief imports (Bahrain): sugar, textiles, machinery, motor vehicles.

Trucial Sheikhdoms.—Monetary unit: Indian rupee. Chief imports: rice, sugar, textiles, machinery. Chief products and exports: pearls, dates (exports, 1952, Rs. 1,000,000), dried fish. Imports (1952) Rs. 35,987,454.

Arboretums: see BOTANY.

Archaeology. Eastern Hemisphere.—The archaeological year 1955 was an active one. For the most part, excavations and projects dealt with sites which already had been under excavation. There were few highly spectacular finds, in the journalistic sense, but much general advance in knowledge of the past.

Pleistocene Prehistory.—For the more remote ranges of prehistoric time, the important finds of the year were linked to discoveries of bones of fossil men and were mainly in Africa. At Ternefine near Mascara, Alg., C. Arambourg recovered two human jawbones in a context which suggested their association with bifacially worked flints of the Abbevillian type. Although coarse pebble tools do proceed them in further Africa, Abbevillian implements are the earliest of the standard Eurafrian series, dating back several hundred thousand years. Up to this time, no bones of fossil men had been found with them.

From Cyrenaica, Libya, west of Derna, C. B. M. McBurney reported the contents of a 25-ft. deep trench in a large cave, Haua Fteah. The sequence yielded recent, Roman, Neolithic, a burin and blade industry, and earliest, a rather late aspect of Levallois-Mousterian. A fossil human jaw fragment appeared in the earliest levels and was dated by radioactive carbon at about 34,000 years ago.

In London, the investigation of the Piltdown hoax was completed with the proof that the tools associated with "Eoanthropus dawsoni" had also been faked.

Referring to more recent prehistoric times, a new cave in northern Spain, at Puente Viesgo, yielded fine outline drawings and engravings of animals in the earlier Franco-Cantabrian style. Carleton Coon carried on test diggings in caves near Palmyra, Syria. Bruce Howe did an extended survey for cave sites in Iraqi Kurdistan for the American Schools of Oriental Research, testing six of the caves and completing his excavations at Palegawra.

Near East.—The Iraq-Jarmo project of the Oriental Institute of The University of Chicago continued its examination of the appearance of the village-farming community in Iraqi Kurdistan. After a survey of the basin of the greater Zab river, five village sites were tested; one of these, M'lefaat, appeared to be the oldest proper village site yet encountered anywhere. In the spring months work at the site of Jarmo was resumed. Extensive data were collected for a reconstruction of the environment in which agriculture, animal domestication and the village-farming community first appeared, and about 52 radioactive carbon samples were secured from the more important prehistoric village sites of western Asia.

Kathleen Kenyon also continued her work on the prehistoric levels of the town of Jericho in Jordan. The earlier of two stone wall foundations, which seem to have encircled the site in very early times, was encountered in several places. Maurice Dunand expanded his exposure of the important earliest level of the prehistoric occupation at Byblos in Lebanon.

In the historic range of time, there was work in Egypt by both the Oriental Institute of Chicago and the University Museum of Philadelphia at Luxor and Memphis. The excitement over the solar boat at the base of the Cheops pyramid tended to deflate to its proper proportions. After the removal of the capping blocks of limestone, one competent Egyptologist observed "so far as we could see there is no hull and scarcely one piece of wood joined to another." Later reports suggested that the thing became slightly more comprehensible after cleaning, but no objects other than those pertaining to a ship were reported.

Meanwhile, a considerably earlier and substantially intact funerary boat was found as part of a great tomb at north Sakara by W. B. Emery. The whole complex, measuring 65 by 27 m., contained many new architectural features, inscribed jar-sealings and pottery, but unfortunately had been severely plundered in antiquity. It was probably the tomb of Udimu, fifth king of the 1st dynasty, and should date to about 3000 B.C.

In Israel, Nelson Glueck carried on a surface survey in the arid Negev district, establishing that the flourishing period of this district, about 2,000 years ago, was the result of irrigation engineering and not climatic change. At Beth Shearim near Nazareth a tomb believed to be that of the noted rabbi, Judah the Prince, was cleared. Exploratory excavations were begun at a town site believed to be that of Netofa, and also at the fortress of Masada overlooking the Dead sea. S. Yeivin, the director of antiquities, reported on excavations in the great port of Caesarea Maritima, in which architectural details, mosaics and sculpture appeared.

Details of the important work in Syria, the continuation of French excavations at Mari on the Euphrates and at the two coastal sites of Amrit and Ras Shamra, were not available. In Iraq, in addition to the prehistoric activities of the Iraq-Jarmo project, the British and German schools and the Directorate of Antiquities were active. The directorate made important clearances in a late Assyrian palace at Nebi Yunis, a mound of the Nineveh complex hitherto untouched because of a mosque and cemetery on its surface. The bases of statues of the Egyptian king defeated by the Assyrians were found. The directorate also continued its work at Hatra, the Parthian fortress city in the

northern desert. A quantity of the exotic half-Greek, Oriental sculpture known as Parthian (first three centuries) was recovered. Max Mallowan extended his clearance of the public building area at Nimrud, one of the Assyrian capitals and had considerable success with heavy excavation machinery in moving fill away from the river wall of the town. Heinrich Lenzen concentrated on architectural exposure in the later levels of the site of Warka, south of Baghdad.

R. Ghirshman resumed the cleaning of the great brick ziggurat tower and temple of Untash-Haban on the Elamite site of Choga-Zambil in Iran. Two other French expeditions were at work in Afghanistan. That of J.-M. Casal at Mundigak in the Kandahar area encountered thirteen levels to virgin soil; the lowermost nine contained simple living debris, next appeared an elaborate monumental building and finally several superimposed levels of post-Harrapan date. The site was yielding important material for the synchronization of the Indus valley Harappan culture with more westerly cultural features. At Surkh Kot in Bactria, Daniel Schlumberger completed the excavation of the Greco-Iranian temples of monumental scale built by kings of the Kushan dynasty.

In Turkey the British school at Ankara under Seton Lloyd carried on significant work at Beycesultan in the Meander river valley. The mound yielded traces of Hittite occupation, an early installation identified with the kingdom of Arzawa which successfully held off the Hittites for some time, and a still earlier and preliterate assemblage with buildings of monumental scale which dated back to about 2700 B.C.

Classical Lands.—In Greece, an important prehistoric village site in Thessaly, Ottaki-Magula near Larisa, was being excavated by a German expedition under Vladimir Milojević. The site appeared to yield an earlier aspect of village materials than yet found in the country.

Alan Wace continued his clearances at Mycenae, concentrating on three houses outside the citadel. At Eleusis, George Mylonas encountered an excellent Protoattic vase (about 600 B.C.) painted with Homeric subjects. C. Blegen continued clearing the Mycenaean palace at Pylos. J. Caskey exposed the Helladic architecture at Lerna.

The American School of Classical Studies proposed to finish its work in the Athenian Agora during the year; a large deposit of pottery was found and the restoration of the Stoa of Attalos proceeded. Oscar Broneer completed clearance of the temple of Poseidon at Isthmia near Corinth. An outstanding find was announced by Emil Kunze of the German Archeological Institute digging at Olympia consisting of portions of the clay mold used by the sculptor Pheidias for casting the gigantic statue of Zeus, one of the Seven Wonders of the World. The French school was busy at Argos and also on the island of Thasos where the Agora was being excavated. The British school worked on southern Chios on its Acropolis.

In Italy, P. Sestieri continued his work at Paestum, opening an underground shrine to the goddess Hera which yielded excellent magnificent bronze vases and a fine black-figure amphora. Greek work of about 550 B.C. At Velia, south of Paestum, Sestieri resumed architectural clearance on a second important Greek colonial town in southern Italy. P. E. Arias reported the discovery of excellent Greco-Etruscan pottery and small objects from mud-filled tombs in land being reclaimed by a drainage project near the Po delta.

An excellent series of Roman sculpture was being recovered from Hadrian's villa near Tivoli. Some of the statues were fragmentary but reconstructible and others essentially whole; at least four caryatids, a Silenus pillar, Mercury, Mars, and Faunus. Tiber were represented. At Stabiae, near Naples, L. d'Orsi uncovered a villa buried since the Vesuvius eruption of 79

which also covered Pompeii. It contained some fine portrait wall paintings. At Pompeii itself the bodies of nine more victims were encountered, including that of a woman wearing jewellery. In 1954 the remains of a large Mithraic temple containing sculpture and small objects had been revealed under the foundations of a later church on the Aventine hill in Rome. An aerial photograph, taken by accident at a time when lighting was propitious, revealed a large and sumptuous Roman villa underlying the airfield at Centecelle, Rome.

There was considerable activity in the provinces of the classical lands. In Cyrenaica, Libya, the ritual baths of a nymphaeum were identified at Cyrene, and C. Kraeling of the Oriental Institute examined Ptolemais. In Tripolitania, the site of a desert outpost-farming community established by the Romans on the Saharan border was studied. In the upper Euphrates valley in Anatolia, a combined German-American staff investigated the Hellenistic shrine of Antiochus I at Nemrid-Dagh and the site of Arsameia, where a long Greek inscription was copied with a "squeeze" of latex. A fine series of late 4th-century B.C. Greek gold vessels was reported found in Bulgaria.

In 1954 when making foundations for a new building in a bombed-out portion of the "city" of London, just south of the Bank of England, the remains of a large Mithraeum (temple) appeared, also some fragmentary sculpture, including the head of the Persian god Mithras from the customary relief for the altar. In 1955 further fragments and the neck of the Mithras were found. The remains were to be reconstructed in the court of the finished office building.

Post-Classical Eurasia.—There continued to be a dearth of news from behind the "iron curtain." The *Illustrated London News* reported a remarkable find of fabrics, carpets and felt work from Pazyryk in Altaic Siberia. Because of their remarkable preservation in permafrost, the original colour, texture and great richness of subject matter had been well preserved. Two rich cemetery finds of Frankish jewellery and glass were made, one in the Netherlands and one in Kent, Eng. The fine late Byzantine mosaics of the Kahrie Djami and of the great palace, in Istanbul, Turkey, were being cleaned and restored.

Further Asia.—In a rock shelter in Kelantan, eastern Malaya, an important series of artifacts of the Hoabinhian "Mesolithic" and of the Malayan "Neolithic" categories were found. It was suggested that included cord-marked pottery was a descendant of pottery common in the Chou dynasty in China, and other dating evidence included fragments of 4th- to 2nd-century B.C. Greek trade wares.

An Englishman repatriated from China brought with him a number of photographs of inscribed and carved tombstones from T'ai-tu, the traditional capital of Kublai Khan. Many of the stones bore Christian symbols; one with a Latin inscription was probably the tombstone of Friar Andrew of Perugia, mentioned by Marco Polo.

(R. J. B.)

Western Hemisphere.—The Society for American Archaeology held its annual meeting of 1955 on May 5-7, at the Uni-

SOUTHWEST WING OF THE PROPYLAEA, the Acropolis, Athens, Gr., showing reconstruction which was completed in 1955

versity of Indiana, Bloomington. On May 4, a group of archaeologists attending the meeting conducted an informal discussion of the current concepts relating to the Archaic stage of culture in North America. An attempt was made to clarify the relationships of Archaic to earlier Paleo-Indian industries, as well as to post-Archaic pottery-bearing cultures.

William Duncan Strong of Columbia University was chosen by the society as the recipient of the 1954 Viking Fund Medal and Award in Archaeology.

Early Man.—By far the oldest radiocarbon dating of traces of early man in the new world was recently determined by W. F. Libby on charcoal samples from the intriguing Tule Springs site in southern Nevada. According to Libby, more than 23,800 years have elapsed since the ancient hunters cooked their game on a series of small camping spots, situated on low clay knolls along a stream. The entire area has been a barren desert in recent times.

Geological studies revealed that subsequent to the probably intermittent human occupations a large lake, or series of lakes, covered the region. It has been suggested that this change was induced by the long wet interval of the Great Pluvial period in the southwest, probably to be correlated with a major early stage of ice advance of the Wisconsin or latest glaciation elsewhere in the country. The lake waters deposited over the site about 14 ft. of silt, containing the shells of small mollusks. A long dry period following the Wisconsin glaciation may have resulted in the evaporation of the lake, after which portions of the silt cover were removed by erosion, exposing the ancient habitation level.

Discovery of this remarkable station came as a result of the paleontological survey of Vegas wash, in 1913, by Fenley Hunter, representing the American Museum of Natural History. Intermingled with ashes and charcoal he detected burned and broken bones of long-extinct Pleistocene mammals, the most abundant of which pertained to a large American camel (*Camelops*). Also represented were a long-horned bison, one species of deer, two species of the American horse, and the mammoth. Among these remains he recovered an obviously man-made obsidian flake,

PREHISTORIC PERUVIAN FIGURE c. 1100 A.D. installed in the Hall of Latin American Archaeology, Smithsonian institution, Washington, D.C., in 1955. The figure, dressed in the ancient garb of coastal Peru, was found in a grave

confirming his suspicion that the bones were split by man to obtain the succulent marrow, then discarded in and around the campfires.

The Southwest museum at Los Angeles was invited to examine the site and in 1933 its curator, M. R. Harrington located a series of additional camp spots about $\frac{1}{2}$ mi. distant, where from similar deposits he obtained crudely chipped, scraperlike and chopperlike stone implements. Preserved in the ashes were several awllike tools made from splinters of camel leg bones.

After receiving the astonishing radiocarbon dating report, Harrington, accompanied by Ruth D. Simpson, assistant curator of the museum, and several associates, revisited the almost inaccessible site in May, 1955. Additional ash beds were excavated, a fire pit where a camel had been cooked and eaten was found, and several additional stone artifacts were collected from among the bones. Some distance from the main site, Miss Simpson discovered much of the disarticulated skeleton of a mammoth, near whose skull lay a small accumulation of charcoal, suggesting human activities.

These finds at Tule Springs went far to advance the case for the long Pleistocene human occupation of the new world.

Remains of a second mammoth, apparently killed by Paleo-Indian hunters, came to light during ditching operations in the dry bed of Lake Texcoco, at Iztapan, near Mexico City. The deeply embedded, vertical orientation of the foreleg bone proved that the enormous elephant had been driven into the sticky mud of the shallow lake, where it was killed with the use of leaf-shaped projectile points found among the bones. These points bear a general similarity to the type known in the United States as Angostura points of the early man horizon of the Great Plains.

Pacific Coast.—A University of Oregon expedition under L. Cressman excavated in an unusually deep and instructive stratified site at Five Mile locks on the Columbia river, exposing four clearly defined geological strata within a continuous reworked deposit 23 ft. thick. Upper level material comprised a wide variety of well-made projectile points and other objects related to later Columbia river cultures. A single point type and a smaller artifact range characterized the next level, while the deepest cultural stratum, sealed beneath a hardpan layer, yielded leaf-shaped knives and projectile points with a shortened, restricted stem, and grooved bola stones, the latter suggesting a method of capture of the large birds whose bones were numerous in this level. This oldest assemblage and its geological setting may be of late Pleistocene age. The site was significant for the light it threw on the cultural succession and chronology of the Columbia river valley.

Plains.—Two large-scale research projects were carried out in 1954 under the Missouri river basin salvage program of the Smithsonian institution, national park service, and co-operating agencies in a valiant effort to save some of the most important archaeological sites to be inundated by extensive dam construction. In the Oahe reservoir, about 20 mi. S. of Mobridge, S. D., Wesley R. Hurt of the University of South Dakota excavated a portion of the rich earth-lodge village of Swan Creek. At Fort Randall reservoir, the Crow Creek site, located between Chamberlain and Fort Thompson, S.D., was partly explored by a crew from the Nebraska State Historical society, led by Marvin F. Kivett. One of the most heavily fortified prehistoric sites in the Missouri basin, this also was shown to have been twice occupied by different Indian villages, as revealed by superimposed house floors and refuse middens.

Eastern North America.—In Georgia, impressive finds were made at the famous site in Etowah Mounds state park, where parties from the Georgia Historical commission under L. Larmon and the University of Georgia, directed by A. R. Kelly. In the case of Mound C, more than 40 graves were uncovered while from a pit dug by the Indians through the mound edge there were recovered two sculptured and painted stone figures about 24 in. in height, representing a seated man and woman. These objects, together with the polished stone "sun disk," a monolithic ax, copper headdress, slate palettes, shell gorgets depicting "Eagle Warriors," and various other objects, pertain to a widely diffused, late prehistoric, religious cult in the southeast.

At Washingtonboro on the Susquehanna river in Pennsylvania, a collaborative research job of the Pennsylvania State museum and North museum of Franklin and Marshall college (Lancaster), supervised by John Witthoft, was clarifying the customs of the Susquehannock Indians, an Iroquoian tribe of some importance to history during the period of transition from native to white man's ways. Most of the new data had come from the graves, whose occupants had been richly provided both with native pottery, pipes and ornaments and with tools, weapons and personal decorations obtained from European traders.

Many archaeologists regard the Hopewellian culture, cent

in southern Ohio and the Illinois valley at about the time of Christ, as the most advanced Indian civilization north of Mexico. In Hardin county, Ill., a burial mound of this culture was explored in the summer of 1955 by a student party from the Illinois State museum, led by Melvin L. Fowler. Thirty burials were found, accompanied by impressive offerings, including copper ear spools, shell beads, effigy pipes, and a cache of cannon coal rings, probably used as ear ornaments.

Middle America.—In Romero cave, high in the Sierra Madre mountains of Tamaulipas, northeastern Mexico, a discovery of much significance to the understanding of agricultural beginnings in the new world was made in 1954 by Richard S. MacNeish and a crew of three student assistants. Twenty-six superimposed layers of cultural debris, recording the presence of seven separate cultural complexes, were cut through. As the cave contents were dry, an amazing richness of perishable materials rewarded the searchers. Especially notable were about 137,000 specimens of vegetable foods, including maize, beans and squash. There were also 500 rope or string fragments, 700 pieces of woven mats and, of more permanent nature, 1,500 tools and weapons, chiefly projectile points and scrapers for working wood and leather.

Only wild foodstuffs were present in the lowest and oldest part of the fill, associated with checker- and twill-work mats, and leaf- and diamond-shaped points and knives. Above this zone the deposit yielded atlatl or dart shafts (but no evidence of the bow and arrow), together with squash and beans, the latter perhaps of still wild varieties. Primitive forms of maize were present in the succeeding level, while in the fourth cultural stratum from the bottom occurred a few grains of teocinte, a wild grass formerly regarded as the ancestor of Indian corn. This same layer yielded four corn cobs showing hybridization with teocinte. This evidence was significant in supporting current botanical opinions which regard the earliest maize as a derivative from a primitive pod corn crossed with teocinte. Cotton cloth and pottery made their initial appearance in the same assemblage. In the fifth level, arrowshafts, tobacco and chili were discovered, while in the uppermost or seventh horizon all weapon shafts pertained to arrows, and the pottery forms bridged the gap into early historic times.

Working in Yucatán for the Carnegie institution of Washington, D.C., Edwin Shook and Robert Smith collected important evidence to prove the absence of a post-Toltec occupation at Chichén-Itzá. At the great Late Empire Maya city of Mayapán, Karl Ruppert and Ledyard Smith completed their immense task of mapping the nearly 4,000 house sites and associated structures.

The Carnegie institution's fifth and final season at this site emphasized the study of domestic rather than religious structures, the results indicating that the rulers of Mayapán had transferred their major interests from the construction of communal religious buildings to their own elaborate dwellings. This significant fact signalized, along with other data, the secular shift in the configuration of Maya culture during this period.

Philip Drucker of the Bureau of American Ethnology and Eduardo Contreras, representing the Instituto Nacional de Antropología e Historia, worked jointly at La Venta, a site of the Olmec culture in Veracruz. Their results included additional important stone sculptures, among them a large seated human figure, another colossal human head and effigies of monsters, jaguars and birds, all carved in the distinctive La Venta style.

Peabody museum of Harvard university completed its third field season in British Honduras, again under the direction of Gordon R. Willey. This long-term investigation into Classic Maya settlement patterns had, by 1955, included the mapping of the Barton Ramie site in the Belize valley which covered an area of about 700 ac. and comprised a ceremonial group surrounded

by nearly 300 house mounds. Thirty-nine of these structures had been studied in great detail in an effort to trace the relationship of the domestic to the ceremonial centres of Maya culture, and to determine the occupational spans of the dwelling units.

South America.—Early in Feb. 1954, the press announcement of the discovery by muleteers of the intact, frozen body of a boy in a stone cairn on the summit of the mountain El Plomo (elevation 5,400 m.), Chile, occasioned considerable curiosity and skepticism concerning its antiquity and cultural affiliations. Subsequently, the Museo Nacional de Historia Natural acquired the body and its funerary accompaniments. On April 3 of the same year, an expedition composed of mountain climbers of the Club Andino de Chile and the archaeologist, Richard P. Schaedel, together with several of his students from the University of Chile, Santiago, attempted an examination of the site. Because of the severity of the weather, this was only partially successful, yet it seemed well established by the evidence gathered that the burial had been interred in one of three cairns, constituting the burial component of a ceremonial complex, which also included a circular stone shrine at 5,200 m. In the frozen soil of a hearth near the latter structure, the expedition found about 100 potsherds representing Inca-type vessels, which, together with the grave furnishings, indicated the Incaic origin of the site, probably sometime within the protohistoric period. (See also ANTHROPOLOGY.) (W. A. RE.)

Archery. The 71st annual National Archery Association tournament was held at Miami university, Oxford, O., Aug. 8–12, 1955, with 245 archers participating. The championship scores of the winners in all divisions were as shown in the table.

Target Archery	
Men's championship	Joe Fries, Los Angeles, Calif.
Scores: Double York round	1,832
Double American round	1,420 3,252
Ladies' championship	Ann Clark, Cincinnati, O.
Scores: Double National round	1,038
Double Columbia round	1,204
Double American round	1,364 3,606
Men's American round division (free style)	J. Robert Kest, Santa Ana, Calif.
Scores: Sextuple American round	4,048
(Bare Bow)	Bertram R. Hatfield, Cincinnati, O.
Scores: Sextuple American round	3,974
Junior boys' championship	Richard Carlson, Sacramento, Calif.
Scores: Double Hereford round	2,042
Double American round	1,434 3,476
Junior girls' championship	Nancy Breneman, Columbus, O.
Scores: Double National round	1,071
Double Columbia round	1,144
Double American round	1,196 3,411
Intermediate boys' championship	Gerald Kapela, Toledo, O.
Scores: Quadruple Jr. American round	2,792
Intermediate girls' championship	Kay Volkman, Dayton, O.
Scores: Double Jr. Columbia round	966
Double Jr. American round	1,326 2,292
Beginner boys' championship	Peter William Wagner, Cincinnati, O.
Scores: Quadruple Jr. Columbia round	1,599
Beginner girls' championship	Jackie Couse, St. Louis, Mo.
Scores: Quadruple Jr. Columbia round	2,175
Crossbow	
Men's championship	Paul Eytel, Pluckemin, N.J.
Scores: Quadruple American round	2,854
Ladies' championship	Lillian Eytel, Pluckemin, N.J.
Scores: Quadruple American round	2,302

Clout Shoot

Men	(36 arrows at 180 yd.)	Dimitri Erdely, Erie, Pa.	36-268
Ladies	(36 arrows at 140 yd.)	Virginia Hersh, Dayton, O.	36-284
	(36 arrows at 120 yd.)	Alice S. Hilton, Dunkirk, N.Y.	36-258
Junior boys	(36 arrows at 120 yd.)	Jerry Gooley, Shelton, Conn.	36-278
Junior girls	(36 arrows at 120 yd.)	Dorothy Breneman, Columbus, O.	36-236
Intermediate boys		Gerald Kapela, Toledo, O.	36-256
Beginner boys		Peter William Wagner, Cincinnati, O.	24-92
Beginner girls		Jackie Couse, St. Louis, Mo.	29-137
Senior men—crossbow		Fred Isles, Cranford, N.J.	34-230
Senior women—crossbow		Lillian Eytel, Pluckemin, N.J.	14-40

The Cleveland Archery club of Cleveland, O., with a team of four men, won the men's team round (96 arrows at 60 yd.) with a total score of 2,767. The women's team round (96 arrows at 50 yd.) was also won by the Cleveland Archery club, with a team of four women.

Jean Richards of Laguna Beach, Calif., former holder of the world's women's championship title 1953-55, placed fifth at the 1955 national U.S. tournament at Oxford, O., with a score of 3,461. Bob Rhode of Minneapolis, Minn., 1954 national U.S. champion, placed second at the 1955 international tourney, Helsinki, Finland, while finishing fifth at the national U.S. tournament with a score of 3,134.

(J. R. K.)

Architecture. Architecturally the year 1955 opened upon an optimistic note in the United States, the 12 regional directors of the American Institute of Architects reporting activity surpassing previous high levels in nearly every section of the nation. Since projects currently upon architects' boards serve as an index to future building, the reports were taken to mean that construction would continue its record-breaking pace. The greatest increase was in the Pacific northwest where gains indicated 30% to 50% more work than a year before. Texas showed a 20% gain, New England and the Gulf states about 18%; and other sections 10% to 15% ahead of 1954. Whereas, for the past several years, school construction had surpassed all other nonresidential classes, during 1955 the volume of commercial jobs equalled that of school work in many areas, the only exception being in the north central states where schools, hospitals and churches ranked in that order. There was a considerable volume in churches, especially in the south Atlantic, central, and Great Lakes areas. The F. W. Dodge corporation reported that church construction was running at the highest rate in history, contract awards in 37 eastern states during the first three months of 1955 totalling \$128,000,000. That was an increase of 61% above the first quarter of 1954.

At the same time, residential construction continued at a good rate, private housing starts rising to 132,000 in May from 127,000 in April, but declining to 129,000 in June and 115,000 in July. This was taken to mean that home construction would level off. However, home-building contracts were still ahead of those of a year before. Builders seemed confident and the housing market was firm with few signs of overbuilding. But on July 30 the Federal Housing administration stiffened the rules on home loans, requiring a higher down payment and shortening the maximum amortization period from 30 years to 25 years. Builders held the opinion that the revised rules would adversely affect the building and sale of houses but not until late in the year. In mid-August, total new housing starts for 1955 were still

estimated at 1,300,000 as compared with 1,200,000 in 1954. Also in August, the government agreed to the construction of 45,000 public housing units.

The 87th annual convention of the American Institute of Architects met in Minneapolis, Minn., June 20-24. The following were elected officers for 1955-56; president, George Cummings, Binghamton, N.Y.; first vice-president, E. A. Heitschmidt, Los Angeles, Calif.; second vice-president, John Richards, Toledo, O.; secretary, Edward L. Wilson, Ft. Worth, Tex.; treasurer, Leon Chatelain, Jr., Washington, D.C. Two members of the institute were advanced to the rank of fellow. Willem Marinus Dudok, architect and city planner of Amsterdam, the Netherlands, was awarded the institute's gold medal for the outstanding honour bestowed by the A.I.A., and nine teachers of architecture from various colleges and universities were cited for distinguished performance in the classroom.

New Materials.—The invasion of aluminum and plastics into the construction field continued at an increased tempo. Various types of aluminum curtain-wall construction were promoted not only as money savers on first cost and maintenance, but also for lightness, economy of space and speed in erection. Under construction at Charlotte, N.C., was an aluminum-domed house for sports events 332 ft. in diameter. Applications of glass to building were multiplied and specific uses of plastics were given increased attention following the publication of the results of a research conference on the subject held in Washington, D.C., late in 1954. Acrylic domes, skylights, floor coverings, translucent roofing and curtain walls, and glazing and lighting fixtures showed signs of becoming common in dwellings, educational and commercial structures. At the University of Illinois, Urbana, architectural investigators experimented with a new material called pneumatic bricks. Each brick, triangular in shape, was made of thin, tough plastic and inflated with air under low pressure. The investigators envisioned the use of this material in building domical structures large enough to cover school grounds, drive-in theatres, ball parks and stadiums, and weather-conditioned to suit the climate. The Small House council of the university reported that there is little practical difference between flooring materials in the amount of resilient underfoot so far as human fatigue is concerned, thus upholding the common opinion on the subject.

Design.—The following five buildings were selected for honour awards in the American Institute of Architects' seventh annual competition for outstanding American architecture: American embassy, Stockholm, Swed., Ralph Rapson, Minneapolis, and John van der Meulen, Chicago, architects; the central restaurant, General Motors Technical centre, Warren, Mich., and the women's dormitories and dining hall, Drake university, Des Moines, Ia., Eero Saarinen and Associates, Bloomfield Hills, Mich., architects; the North Hillsborough (Calif.) elementary school, Ernest J. Kump, Palo Alto, Calif., architect; the general Telephone Company of the Southwest, San Angelo, Tex., Pace Associates, Chicago, Charles B. Genthner, architect in charge.

The Chicago chapter of the institute honoured 64 architects, craftsmen, owners and artists for "outstanding architectural contributions to the growth and improvement of Chicago during the last five years." Honour awards went to the Sawyer Building, company's plant, Skidmore, Owings and Merrill, architects; Village market, La Grange, Ill., Mittelbusher and Tourtellot, architects; Saint Patrick's high school, Chicago, Belli and Associates, architects; Lake Meadows apartments, Chicago, Skidmore, Owings and Merrill, architects; American Bar centre, Chicago, Holabird and Root and Burgee, architects. The Architectural league of New York awarded its 1955 gold medal to Skidmore, Owings and Merrill for the design of the Manufacturers

NOTRE-DAME-DU-HAUT, church designed by Le Corbusier (C. E. Jeanneret) and completed in 1955 on the summit of Haut Lieu, in the Vosges mountains, France. The almost complete absence of straight and parallel lines gave the church its unique appearance

company building on Fifth avenue.

Churches attracting attention for nontraditional treatment were the chapel of the Colorado Agricultural and Mechanical college at Fort Collins; the Children's chapel at the Neighborhood church in Pasadena, Calif.; the Church of Saint Albert the Great at Compton, Calif., which was the award winner in the 1955 Architectural Competition for Catholic Institutional Design; and Saint Brigid's church in Los Angeles. Miami Beach's new \$15,000,000 Fountainebleau hotel attracted attention, as did the new Hilton hotels in Dallas, Tex., and Beverly Hills, Calif.

Opposition was generated in architectural circles to the proposed demolition of the United States patent office, designed in the 1830s by Robert Mills, architect also of the treasury building and the Washington Monument. It was proposed to use the site for a commercial parking lot. Also opposed was the proposal to move the east front of the Capitol out about 40 ft., to secure extra space and to give the dome greater apparent support.

Important structures under construction or completed during the year included the 42-story stainless steel Socony-Mobil building in New York city; the 24-story Second National bank, Houston, Texas's largest office building; the Teamsters Union building, one of Washington's handsome office buildings; the American Shakespeare Festival theatre in Stratford, Conn.; the \$17,000,000 Walt Disney amusement park at Anaheim, Calif.; Ohio State university's field house on the campus at Columbus; the \$35,000,000 New York Coliseum at Columbus circle; Los Angeles county's \$18,000,000 courthouse, and the Dallas Memorial auditorium and the Dallas public library. Interesting projected structures were the New York Life Insurance building, Los Angeles; a new barracks building at the U.S. Amphibious base, Coronado, Calif.; the U.S. Air Force academy near Colo-

rado Springs, models of which, unveiled on May 14, set off a series of criticisms from congressmen and architects. Thirty-three buildings of aluminum, stainless steel, glass and native granite were envisioned. Modern in conception were the proposed Inland Steel company's 19-story office building in Chicago; the Tishman Realty company's 13-story office building in Los Angeles, and 36-story office building adjacent to Rockefeller center in New York city; and the 38-story Seagram building in New York.

Other Countries.—The University of Illinois, through its Small Homes council, undertook a giant housing program at Bogotá for the Colombian government. Five university experts assisted government officials and building firms in the improvement and expansion of low-cost housing. In Istanbul, Turk., the Hilton hotel chain opened a palatial modern hotel. In Belgium, plans were announced for the building of a "vertical city" in a tower 400 ft. higher than New York's Empire State building, the structure to be a feature of the Brussels world's fair in 1958. At Stuttgart, Ger., architect Rolf Gutbrod began construction of a musical centre designed to restore Stuttgart's former musical eminence. In Mexico City, the Church of the Virgin Milagrosa by Felix Candela attracted wide attention, as did neighbourhood housing in Rio de Janeiro, Braz. The church is of thin-shell reinforced concrete construction. The fourth congress of the International Union of Architects was held at The Hague-Scheveningen, the Netherlands, July 11 to 16. The ninth Pan-American Congress of Architects convened at Caracas, Venez., Sept. 12 to 22.

(R. NB.)

Areas and Populations of the Countries of the World.

The political entities of the world are listed here with their areas, populations and number of persons per square mile. The latest census or official esti-

mate is given for each country. Areas in square miles are in accordance with the boundaries for the year of the population figure unless otherwise noted. Some of the later boundary adjustments had not been recognized at the end of 1955 by the U.S. government. The subtotals for colonial groupings within continents do not carry density figures. Where two figures are given for a country, the most recent is used in the continental and world totals. The table provides a fundamental basis for country comparisons.

Areas and Populations of the Countries of the World

(For statistical details and dates see separate articles)

Name of continent and state	Area (in sq.mi.)	Population (in thousands)	Persons per sq.mi.
World total	58,326,852	2,644,840	50.5*

Argentina. A republic occupying the southeasternmost section of South America, Argentina is bounded on the north by Paraguay, Bolivia and Brazil; on the south and west by Chile; and on the east by Uruguay, the Rio de la Plata and the Atlantic ocean. It is the second largest Latin American nation—only Brazil is larger—with an area of 1,084,359 sq. mi. and a population of 18,919,000 (est. 1955), mostly of European ancestry. The capital and leading port, Buenos Aires, had in the 1947 census 2,981,043 (1952 est. 3,403,600). Other leading cities, with 1950 populations, are: Rosario, 467,937; Córdoba, 369,886; Avellaneda, 278,621; La Plata, 207,031; Lanús, 244,473; Tucumán, 194,166; Santa Fé, 168,791; Lomas de Zamora, 125,943; Quilmes, 115,113; Mar del Plata, 114,729; Mendoza, 97,496; and Bahia Blanca, 112,597. Religion: Christian, mostly Roman Catholic. President in 1955: Gen. Juan D. Perón (Sept. 19); Gen. Eduardo Lonardi (Sept. 23–Nov. 13); Gen. Pedro Aramburu (from Nov. 13).

History.—The nine-and-a-half-year-old regime of Pres. Juan Perón was overthrown by the armed forces in Sept. 1955. The revolution was enthusiastically acclaimed in Argentina, for during the preceding year the president had aroused powerful forces of opposition. In late 1954 he had turned against the Roman Catholic Church, which, while recognized since 1946 as one of his government's chief allies, was the only major organization still relatively independent of Peronista control. Perón charged that clerical "troublemakers" had been infiltrating labour unions and student groups and meddling in political activities, es-

ially in the Catholic stronghold of Córdoba province. He sought to hush such activity by arresting priests whom he called enemies of the state. By Sept. 1955, more than 60 clergymen had been detained for showing "disrespect" for the president or for "fomenting disturbances."

Perón insisted that his grievance was against individual clergymen rather than against the church itself. Nevertheless, he undertook a systematic campaign to undermine the power of the church, primarily in the field of education. Hundreds of clerical and proclerical teachers were purged from the state-controlled schools and universities. Catholic religion and morality were removed as required subjects from school curricula. In March the education ministry accused 89 private Roman Catholic schools of having fraudulently padded payrolls subsidized by the government. Subsequently, the government withdrew its financial support, which had amounted to \$6,000,000 a year, for the church's nearly 1,000 schools. In May all religious institutions were made retroactively subject to taxation as of the first of the year. Also in May congress passed a bill calling for the election in November of a constituent assembly to vote on disestablishing Roman Catholicism as the nation's official religion.

The reaction of the church and its supporters to Perón's campaign was one of growing resistance. Priests spoke out from the pulpit against the government. Many Catholics, including one cabinet minister, resigned in protest from government posts. In defiance of a police ban on outdoor religious gatherings, royal Catholics held a number of church processions which they turned into antigovernment demonstrations. Perón retaliated for one such demonstration, which occurred on June 11 on the occasion of a Corpus Christi celebration, by arresting and deporting two Argentine-born prelates, Mgr. Manuel Tato and Mgr. Ramón Novoa, whom he labelled the brains of the "treasonous" demonstrations. The Vatican promptly excommunicated Perón and all other government authorities who had "trampled on the rights of the Church."

On June 16, the same day as the excommunication, a rebellion against Perón by the navy and part of the air force was suppressed by the army under the direction of the army minister, Gen. Franklin Lucero. Though unsuccessful, the uprising was a measure of the growing disaffection for the Perón regime. Reportedly under pressure from his "loyal" army staff, the president launched a campaign of "pacification" to reduce tensions in the nation. An effort was made to placate the church by the release of jailed priests, the halting of anti-Catholic invective in the press, the resumption of salary payments to some clergymen, and the replacement of several officials considered the chief government agitators against the church.

Perón also made peace overtures in July to his political foes, to whom he offered a "hand of friendship." He promised a new era of constitutional government and a reform in the Peronista party. However, opposition parties rejected his peace offer, alleging that basic freedoms were still not being restored. Renewed antigovernment violence in August was answered by Perón with what was generally regarded as a "rhetorical" offer to resign. He then made a speech in which he "submitted" to the demands of his labour supporters that he continue in office. He promised to fight his opponents as never before and exhorted his followers to annihilate five adversaries for every Peronista that might fall.

On Sept. 16, exactly three months after the frustrated revolt in June, a group of army malcontents under the leadership of Gen. Eduardo Lonardi struck against the government from interior garrisons, principally at Córdoba. The movement was supported by the navy, which threatened bombardment of the federal capital by its vessels in the Río de la Plata. On Sept. 19,

WOMAN PRAYING in the ruins of San Francisco basilica, Buenos Aires, after anti-Catholic mobs attacked Argentine churches in 1955

Perón resigned and sought asylum on a Paraguayan gunboat, on which he was later allowed to escape to Paraguay.

On Sept. 23, Lonardi became provisional president of the nation. He dissolved the Peronista congress and promised to restore civil liberties and property unjustly seized under the Perón administration. He allowed an unpopular contract to lapse which had been signed by Perón earlier in the year with Standard Oil Co. of California. This agreement had provided for liberal petroleum exploration and development rights in southern Patagonia for the U.S. company. It had stirred up a nationalistic furor which was considered by many to have contributed to Perón's downfall equally as much as his attacks on the church.

Lonardi's efforts to compose a conciliatory government of both "middle-of-the-road democrats" and right-wing nationalists alienated liberals. On Nov. 13, the army ousted the new president after he refused to fire a number of "reactionary" cabinet ministers. His successor, Gen. Pedro Aramburu, had participated in the September uprising alongside Lonardi. (See also ANT-ARCTICA; FOREIGN INVESTMENTS.) (R. HN.)

Education.—On June 30, 1951, there were 15,874 primary schools with 2,446,138 pupils and 101,646 teachers; 2,069 public secondary normal and special schools with 360,917 students and 46,204 teachers; 32 autonomous schools with 2,544 students and 206 teachers; and 1,132 private schools with 153,926 students and 4,993 teachers. There were national universities at Buenos Aires (41,325 students), La Plata (7,409), Córdoba (9,335), Cuyo (2,596), Tucumán (3,191) and the National

University of the Litoral at Santa Fé (16,325). University professors numbered 3,621.

Finance.—The monetary unit is the peso, valued during 1955 until Oct. 27 at 13.33 cents U.S. currency, official rate, 20 cents, preferential rate, and 7.16 cents, legal free rate. The latter two rates were abolished on Oct. 27. Effective Oct. 28 the official rate was changed to 5.56 cents; a new free market rate, which became operative on Nov. 3, was quoted at 3.12 cents on Nov. 21. The 1955 budget allocated 10,244,700,000 pesos for the national administration, 4,614,300,000 pesos for autonomous institutions and 2,683,000,000 pesos for special accounts. The national debt (all internal) was 34,161,700,000 pesos on Dec. 31, 1953. The debt figures did not include the floating debt at call or the debt of the official agencies (notably I.A.P.I., estimated at close to 10,000,000,000 pesos at the end of 1953) and of provincial and municipal governments. Currency in circulation (May 31, 1955) was 25,920,000,000 pesos; demand deposits (Jan. 31, 1955), 18,589,000,000 pesos. The U.S. department of commerce estimated U.S. direct investments in 1954 at \$425,000,000. The cost-of-living index (Buenos Aires) stood at 374 in April 1955 (1948=100). National income in 1954 was estimated at 104,839,000,000 pesos.

Trade and Communications.—Exports in 1954 were officially valued at 6,721,000,000 pesos and imports at 7,112,000,000 pesos. Leading exports were cereals and linseed (31%), meat (20%), wool (11%), hides (7%) and dairy products (4%); leading imports, machinery (20%), fuel and lubricants (13%), foodstuffs (11%), chemicals (9%) and timber (9%). Leading customers were the U.K. (18%), the U.S. (14%), Germany (10%), Brazil (9%) and the Netherlands (6%); leading suppliers, the U.S. (14%), Brazil (12%), Germany (9%), the U.K. (7%) and France (5%).

Railways (1949) totalled 26,893 mi. In 1952 there were 248,400 mi. of road, of which 41,000 mi. were national and provincial highways. Registered motor vehicles (Jan. 1, 1955) included 314,185 automobiles, 148,505 trucks and 14,903 buses. Commercial air lines flew 11,772,000 mi. and carried 469,900 passengers in 1954. According to *Lloyd's Register of Shipping*, the merchant marine (June 30, 1954) had 400 vessels (100 tons and over) aggregating 1,070,995 gross tons.

Agriculture.—Production figures for the crop year 1954-55 were officially reported as follows (in metric tons): wheat 7,690,000; maize 2,580,000; barley 1,112,000; oats 890,000; rye 844,000; linseed 482,000; cotton 346,000; rice 183,000; millet 124,000; potatoes 1,318,910; tobacco 28,200; sunflower seed 304,500. Grain exports in 1954 (metric tons) included wheat 2,908,170; maize 2,155,386; rye 835,516; oats 691,910; barley 669,512.

The 1952 livestock census showed 45,262,995 cattle, 54,683,731 sheep, 3,989,188 pigs, (census 1947) 7,237,663 horses, 4,933,679 goats. Wool exports in the wool year ending Sept. 30, 1955, were reported unofficially at about 227,130 bales (1953-54: 199,824 bales). Meat production (1954) was about 1,060,000 metric tons. The sea fisheries yielded 70,254 tons in 1954. Exports of quebracho extract were 153,000 tons.

Manufactures.—According to the 1954 industrial census, there were 181,763 manufacturing and mining establishments with 1,536,530 employees. Production figures for 1954 included portland cement 1,680,000 metric tons; cotton yarn 83,400 tons; wheat flour 2,006,400 tons; electric energy 5,476,000,000 kw.hr.; manufactured gas 318,000,000 cu.m.; sulphuric acid 54,000 tons; tires 788,000 units. In 1954 there were 844,000 cotton spindles and 26,987 looms and 470,000 wool spindles and 9,000 looms. The index of industrial production stood at 103 in 1954 (1948=100).

Minerals.—Petroleum production in 1954 totalled 4,200,000 metric tons (about 29,400,000 bbl.), more than 80% of which came from government fields. Production of lead in 1954 was estimated at 28,700 short tons; zinc 20,852 tons; coal 103,000 tons. In 1954, 1,443,000 long tons of coal were imported. (J. W. Mw.)

Arizona. Arizona, the "Grand Canyon state," lies in the southwestern part of the United States, being bounded on the west by the Colorado river and Nevada and on the south by Mexico. The area is 113,575 sq. mi. The population (1950 census) was 749,587, a 50.1% increase over that of the previous decade. Whites numbered 654,511; Negroes, 25,974; Indians, 65,761; Japanese, 760; and Chinese, 1,644. The estimate for the state (July 1, 1955) was 955,000. The capital, Phoenix (1955 estimate), numbered 155,000, city limits, and 335,000, municipal area. Tucson (1955 estimate) numbered 60,000, city limits, and 195,000, municipal area. The chamber of commerce quoted Yuma as 23,000 in 1955. Mesa (1950) had 16,700; Douglas, 9,942; Flagstaff, 7,663; and Prescott, 6,764.

History.—State officers (1955) were: chief justice, Arthur La Prade; governor, Ernest W. McFarland; secretary of state, Wesley Bolin; treasurer, R. T. Williams, Jr.; attorney general, Robert Morrison; superintendent of instruction, Clifton L. Harkins. The first session of the 22nd legislature, beginning Jan. 10, 1955, lasted 84 days, 24 longer than the limit and next to the longest in state history. The main issue that delayed the session was the important educational measure. On Jan. 10 Governor McFarland proposed, among other matters, that the average daily attendance allocations in the public schools be increased from \$115 to \$175. The state had been furnishing \$95

ANTELOPE FAWN netted near Flagstaff by members of the Arizona Game Fish commission in 1955. The baby antelopes are tagged and released annually as part of a continuing study of the migratory habits and life span of animals.

and the counties \$20. The governor indicated that this was equalization for the poorer school districts. Most of the additional appropriation was destined to come from the smaller counties with valuable taxable property. On Jan. 28 the house passed the first bill, 49 to 22, appropriating only \$165 per child per year, the state to furnish \$135 and the counties \$30. The estimated increased cost to the state was \$8,737,000. The senate would not accept this, so the matter was turned over to the senate committees for discussion. On March 21, 11 days prior to the time for adjournment, the senate passed a bill authorizing appropriation of \$150 per pupil. A conference committee was compromised on an appropriation of \$155, but the house rejected that. Finally, on March 29, a compromise was reached for \$157.50, the state to furnish \$127 and the counties \$30.

An additional appropriation of \$45,000 was made to the commission which was to continue its work of revision of the Arizona code. A new boundary commission was named to work on the problem of the boundary between Arizona and California caused by the changing course of the Colorado river. An act relating to public welfare provided that the estate of any person having received old-age assistance should be free from any claim of the state based on such assistance. The only attempt to deal with the hitherto unsolved problem of underground water supply was an appropriation of \$8,700 to be available till June 1955, to make ground water surveys in co-operation with the U.S. Geological survey.

Education.—The enrollment in elementary schools and number of teachers for 1954-55 were, respectively, 166,041 and 5,373; the corresponding numbers in the high schools were 42,793 and 1,763. The appropriation (1955) for the University of Arizona and the two state colleges at Tempe and Flagstaff were, respectively, \$3,683,004, \$2,116,907 and \$671,511.

Social Insurance and Assistance, Public Welfare and Related Programs.—The total number receiving state assistance in Aug. 1955 was 26,614. The state welfare appropriations were: industrial school, \$405,149; state hospital, \$2,232,586; crippled children, \$315,780; dependent children, \$1,442,700; pioneer home, \$170,389; prison, \$1,035,460; support for the deaf and blind, \$362,061; tuberculosis sanitarium, \$292,000; old-age assistance, \$3,508,200.

Table I.—Principal Crops of Arizona

Crop	Indicated 1955	1954	Average, 1944-53
Arley, bu.	11,280,000	13,936,000	5,378,000

Table III.—Mineral Production of Arizona

Mineral	Quantity 1952	Value 1952	Quantity 1953	Value 1953
Clays	247,000	\$ 579,000	197,000	\$ 715,000
Copper	396,000	191,528,000	394,000	225,883,000
Gold (oz.)	112,000	3,932,000	113,000	3,949,000
Lead	17,000	5,319,000	9,000	2,470,000
Iron	53,000	757,000	96,000	1,238,000
Aluminum	1,000	1,987,000	1,000	1,426,000
Pumice	*	*	124,000	426,000
Sand and gravel	1,824,000	1,636,000	3,447,000	2,680,000
Silver (oz.)	4,701,000	4,255,000	4,351,000	3,938,000
Stone	235,000	356,000	442,000	619,000
Coal	47,000	15,651,000	28,000	6,332,000
Other minerals	5,702,000	...	6,940,000
Total		\$231,702,000		\$256,616,000

Communications.—The Arizona highway department's report (1955) for mileage was: primary state highways, 4,225; county roads, 16,176; federal-aid highways, 2,417; national roads, 8,236. The Arizona corporation commission reported that there were six railroad companies with a total mileage of 2,182.64. It also reported that there were six telephone companies with no available information as to total subscribers. There were four passenger airlines in the state besides a number of individual concerns that furnished passenger service. Phoenix had nine radio and four television stations (1955); Tucson, six and two.

Banking and Finance.—The superintendent of banks reported for June 30, 1955, that national banks had deposits of \$518,515,194; loans and discounts, \$261,078,833; government securities, \$146,710,773. State banks had deposits of \$201,375,415; loans and discounts, \$74,317,749; government securities, \$87,570,480, each item being in excess of that of the same month of the previous year. The state and local taxes for the fiscal year of 1954-55 were \$129,114,065; and the federal taxes were \$167,714,000. The total cost of operating the state government beginning with the fiscal year July 1, 1955, was \$93,941,584. The bonded indebtedness at the beginning of the fiscal year 1954-55 was \$6,434,275.

Agriculture.—Weather periods for 1955 were exceptional. The first three months were noted for decided decline in water flow. During March the Gila river had a runoff of 6,280 ac.ft., 30,000 being the average. Then July and August had a rainfall exceeded only twice in 60 years. The heavy rains of the late season decidedly injured the maturing cotton crop. The rains did bring the ranges into ideal condition to the advantage of the cattlemen.

Manufacturing.—While not the leading industry in Arizona, manufacturing showed a decided gain since 1950. Returns in 1950 were \$142,700,000; in 1953, \$312,000,000. The number employed in July 1954 was 26,900; in July 1955, 31,400. The building of U.S. plants had increased in the industry. The Hughes Aircraft company of Tucson, producer of guided missiles, had a several-million-dollar expansion program. The Fort Huachuca electronics proving ground was another important center. This institution planned to work with the electrical engineering department of the University of Arizona. The large building programs created a demand for many articles produced in Arizona. (H. A. H.)

Mineral Production.—Table III shows the tonnage and value of minerals produced in Arizona for 1953 (preliminary) compared with 1952, for those whose value exceeded \$100,000. In 1953 Arizona was first among the states in barite and copper, third in asbestos, mica and pumice and fourth in both gold and silver outputs. The state was 15th in rank, with 7.8% of the U.S. total value of minerals.

Arkansas. Arkansas, a south central state of the United States, often called the "Land of Opportunity," was admitted to the union in 1836. Its area is 53,104 sq.mi., including 429 sq.mi. of water. Pop. (1950 census) 1,909,511; (July 1, 1955, est.) 1,770,000. The 1950 census figures placed 77% of the population in rural areas compared with 77.8% in 1940. The population was listed as 77.1% native white, 0.5% foreign-born and 22.3% Negro.

Little Rock, the capital city, had 102,213 inhabitants in 1950. Other principal cities are: Fort Smith, 47,942; North Little Rock, 44,097; Pine Bluff, 37,162; Hot Springs, 29,307; El Dorado, 23,076; Fayetteville, 17,071.

History.—A new governor, Orval E. Faubus, was inaugurated in 1955. The general assembly reorganized the state's fiscal organization that had been established two years previously, but it left the legislature with broad post-auditing powers. One of the most significant additions to the governmental organization was the creation of the Arkansas Industrial Development commission to intensify the state's efforts to balance its industrial development with the traditional agricultural-timber-mineral economy. Winthrop Rockefeller, who established his home in Arkansas in 1953, headed the commission, on appointment of Governor Faubus.

The state's tax-supported colleges opened their doors to Negroes for the first time, following the U.S. supreme court's integration decision. Integration in the secondary and high schools was moving at a considerably less accelerated pace. Negro enrollment at the colleges was largely token since one of the state's best schools was operated for Negroes and had been for a half century.

State officials during 1955 in addition to Governor Faubus included Nathan Gordon, lieutenant governor; C. G. (Crip) Hall, secretary of state; J. Oscar Humphrey, state auditor; J. Vance Clayton, state treasurer; Tom Gentry, attorney general.

Education.—For the school year 1953-54 Arkansas had 1,424 elementary schools with an enrolment of 147,311. Teachers and principals in elementary schools numbered 7,988; in secondary schools, 5,831. Expenditures for the year ending June 30, 1954, totalled \$54,975,382. State sources, \$27,503,016; revenue received, \$53,999,164. Arch Ford was commissioner of education.

Social Insurance and Assistance, Public Welfare and Related Programs.—For the fiscal year ending June 30, 1955, old-age assistance grants in the amount of \$21,588,341 were paid to a monthly average of 53,196 recipients. A monthly average of 1,951 blind persons received a total of \$946,185; an average of 771 general relief cases (temporarily disabled) received \$143,648.18; and an average of 4,232 permanently and totally disabled persons received a total of \$1,567,253.

Unemployment benefits paid to about 46,444 persons during the fiscal year ending June 30, 1955, totalled \$7,906,634. There were 458,359 weeks of unemployment and the average weekly payment was \$17.25.

Arkansas maintained one penitentiary and four reformatories at a total expense of \$1,101,923.86 during the fiscal year of 1954. The institutions housed an average of 1,618 adult and 305 juvenile inmates.

Communications.—Expenditures by the state government on highways during the fiscal year ending June 30, 1955, totalled \$34,050,796.92. At the end of that period, the highway system comprised 10,036 mi. County highways, not in the state system, measured 57,326 mi. Paved roads in the state totalled 7,461 mi. In the fiscal year 592 mi. of roads were paved and 122 bridges were built on state highways.

Table I.—Principal Crops of Arkansas

Crop	Indicated 1955	1954	Average, 1944-53
Corn, bu.	17,118,000	8,364,000	24,369,000

Table III.—*Mineral Production of Arkansas*
(Short tons, except as noted)

Mineral	1952		1953	
	Quantity	Value	Quantity	Value
Barite	429,000	\$3,964,000	381,000	\$3,946,000
Bauxite	1,796,000	10,235,000	1,714,000	12,976,000
Clays	553,000	1,514,000	529,000	1,734,000
Coal	873,000	6,839,000	775,000	6,144,000
Natural gas (thousand cu.ft.)	42,325,000	1,735,000	41,510,000	2,200,000
Natural gasoline (thousand gal.)	62,000	4,580,000	58,000	4,123,000
Petroleum (bbl.)	29,440,000	72,420,000	29,681,000	77,170,000
Petroleum gases (thousand gal.)	49,000	2,079,000	55,000	2,562,000
Sand and gravel	5,011,000	4,977,000	4,904,000	4,955,000
Stone	2,967,000	3,346,000	3,061,000	3,865,000
Other minerals	\$5,998,000	...	6,210,000
Total		\$117,687,000		\$125,885,000

Main track railway mileage was 4,600, airway mileage approximately 1,000. There were 83 established airports. Approximately 236,000 telephones were in use in the state.

Banking and Finance.—Arkansas had 179 state and 54 national banks on June 30, 1955. Deposits in state banks totalled \$430,059,125.42. Deposits in national banks totalled \$493,592,000; resources, \$539,399,000. There were 38 federal savings and loan associations and nine active state building and loan associations.

Total expenditures for the state for the fiscal year ending June 30, 1955, were \$173,674,630.95. Total revenue for the same period, both general and special, amounted to \$206,925,851.02. There was \$63,183,349.93 surplus from allotted funds, appropriated and federal funds.

Agriculture.—The U.S. department of agriculture estimated the value of crops harvested in Arkansas in 1954 at \$397,000,000, a decrease of \$316,790,000 from 1953. Cotton was the state's most valuable crop in 1953, worth \$261,000,000; rice ranked second with a value of \$62,853,000; soybean was valued at \$22,285,000.

Cash receipts to farmers from farm commodities sold during 1954 totalled \$541,000,000, a decrease of 4% from 1953. Livestock accounted for \$171,748,000 or 32% of the total cash receipts. Percentage in distribution remained unchanged.

Manufacturing.—Gross sales or receipts of all manufactured goods for 1954 totalled \$899,000,000; this included \$595,000,000 of nondurable goods; \$304,000,000 of durable goods. Wages in manufacturing as of Sept. 1955 totalled approximately \$56,865,933 and were paid to a monthly average of 80,626 employees. During 1954, the Arkansas Industrial Development commission reported 54 new industries established and substantial expansion made in 43 existing industries, at a total cost of \$10,700,000. The greatest number of new units were listed in food processing, wearing apparel and fabrics plants. (O. E. F.)

Mineral Production.—Table III gives the tonnage and value of mineral commodities produced in Arkansas in 1952 and 1953 (preliminary). It lists commodities valued at \$100,000 or more. Arkansas leads all the states in the production of bauxite and barite and in 1953 was fourth in manganese output. It ranked 24th in value of mineral output, with 0.88% of the U.S. total.

Armies of the World.

The major developments affecting the ground forces of the world during 1955 were as follows: (1) the rearmament of the German Federal Republic was finally started with the ratification of the necessary treaties, and steps were taken by the Bonn government to organize the cadre of the army in early 1956; (2) a treaty with Austria was signed by Britain, France, the United States and the U.S.S.R. and their occupation forces were removed; (3) a series of major proposals for disarmament were made by the great powers; (4) the force level of the North Atlantic Treaty organization levelled off for the first time; (5) Iran announced that it had joined a mutual defense pact with Great Britain, Turkey, Pakistan and Iraq; (6) there were sporadic clashes between the forces of Egypt and Israel along the Gaza strip; (7) arms were offered by the U.S.S.R. and Czechoslovakia to Egypt, Israel and other middle eastern states; (8) serious fighting broke out in North Africa between Arab nationalists and French forces; (9) the SEATO (Southeast Asia Treaty organization) powers established a headquarters at Bangkok, Thailand, and set up a military staff.

Disarmament.—Several major proposals for disarmament which would drastically affect the ground forces were presented during the year.

The U.S.S.R. on May 10 proposed a reduction of armaments and prohibition of atomic weapons in two stages of one year each. It was proposed that the signatories would agree not to increase their armed forces, armaments and appropriations for military purposes above the level of Dec. 31, 1954. The level to which the armed forces were to be reduced was to be: U.S.S.R., U.S. and Communist China 1,000,000 to 1,500,000 men each; France and the United Kingdom 650,000 each. The reduction

to these levels was to be 50% in the first year and 50% in the second year. Other aspects of the proposal included a world conference in the first half of 1956; a cessation of tests of atomic and hydrogen weapons; liquidation of bases on the territories of other states; and broad international co-operation in the field of peaceful uses of atomic energy.

Proposals of the United States were made by Pres. Dwight D. Eisenhower at the Geneva Four Power conference in July. The U.S. called for exchange of complete blueprints of military establishments to include identification, strength, command structure of personnel units and equipment of all major land, sea and air forces including organized reserve and paramilitary and complete list of military plants, facilities and installations with their locations. Exchange of information would proceed from least sensitive to more sensitive, and facilities for aerial photography would be made available to aircraft of other nations or of an international body.

A French plan called for progressive reduction of expenditures for military purposes, transfer of the resultant savings to an international mutual aid development fund and utilization of these funds for capital goods to underdeveloped areas.

The British proposal called for a control unit with the right of full information and inspection on the number of armaments, forces and equipment, military installations, factories, nuclear installations and plants capable of making chemical and biological weapons. The methods of inspection would include aerial reconnaissance, inspection on the ground, budgetary control and observation at strategic points. The control organ would have unrestricted rights of freedom of movement, full use of communications, right of access to all objects, right to investigate breaches and to use technical devices.

NATO.—A decrease in defense expenditures on the part of nearly all members, reduction in the length of military service in several countries, removal of 70,000 first-line French troops and their replacement by reserves not considered up to NATO standards were the principal problems affecting the North Atlantic alliance during the year. Defense expenditures by member nations dropped 2.4% from 1953 to 1954, with the United States down from \$49,499,000,000 to \$43,690,000,000, a drop of 12%; Canada from \$1,970,000,000 to \$1,899,000,000 and the 11 European members from \$11,133,000,000 to \$10,865,000,000. West Germany's indication to NATO of a proposed defense expenditure of \$2,143,000,000, roughly equivalent of the contribution to the support of the three occupation forces before the treaty, was considered inadequate by NATO headquarters.

Strength.—Although the troops of the NATO powers were organized into 90 to 100 divisions, only 48 of these were active and only 16 of the active divisions were left in the so-called "shield" force from the North sea to the Alps. The NATO flank from the North cape to Schleswig-Holstein was considered to be particularly vulnerable, with less than two divisions constituting the land forces under arms. Four British divisions were the core for the defense for Belgium, the Netherlands, Denmark and Norway. The three active Belgian divisions had been depleted by reduction in conscription from 24 to 18 months and consideration was being given to merge the three into one. The Netherlands reduced the number of divisions from five to three, one active and two reserve. Norway increased conscription from 14 to 16 months, not 18 as planned, and maintained only one active brigade rather than the two originally planned. Denmark reduced conscription from 18 to 14 months, and reduced divisional strength from 3½ to 1. The British strategic reserve consisted of three brigades in the United Kingdom against a goal of two divisions that could be on a war basis in 30 days. Italy's planned nine active divisions reached the equivalent

lent of six. The active force of the Greek army was reduced. The U.S. forces in Austria were moved to north Italy after the signing of the Austrian peace treaty and placed under Allied land forces, south Europe.

Training.—All forces intensified their training for nuclear warfare. The British NATO forces experimented with "checker-board deployment" of units self-sufficient even at battalion level. Several large manoeuvres were held in Germany with Exercise "Cordon Bleu," one of the largest, involving more than 100,000 men.

Equipment.—France proposed a limited pooling of arms manufacture for two years to be followed by the creation of a highly centralized supranational control organization over arms. NATO progress in equipment was principally in interchangeability rather than uniformity. Standardization of such end items as tanks, guns and planes made no progress. For example, extensive discussions were held on the problem of making any military tractor so that it could tow any military trailer. Typical of the standardization agreements reached was establishing 24 v. as the standard battery system for military vehicles.

Middle East.—The possibility of an arms race in the area was rendered more imminent by offers of arms to both Egypt and Israel by the communist bloc. The threat of general hostilities between Israel and Egypt was averted only by constant pressure from the UN truce team and Britain, France and the United States. A "northern tier" defensive alliance was created by the signing of a defense co-operation agreement between Turkey and Iraq in February, joined by Britain in March, Pakistan in May and Iran in October. This alliance created consternation in Cairo as Egypt was trying to develop greater co-ordination between the Arab league members, of which Iraq was a member, and in Moscow, which wanted to neutralize Iran in accordance with traditional Russian policy. With the possible intent of replacing the Arab league, Egypt, Syria and Saudi Arabia announced an agreement not to join the Turkish-Iraq pact, and plans for a joint military command to supervise training, arming and deployment of the Arab armies and for co-ordination of war industries and communications.

Two major areas of conflict erupted between Egypt and Israel. Along the Gaza strip patrol clashes brought casualties and reprisals to each side. The UN truce commission proposed joint patrols, only regular troops in the frontier zone, barbed wire at trouble spots, and a commanders' agreement. Egypt closed the Gulf of Aqaba leading from the Red sea to the Israeli port of Elath by guns on the islands of Tiran and Sarafia, and Israel threatened to force the gulf. Both sides agreed to evacuate forces from the El Auja zone on the Sinai border after Israeli forces occupied the area in September, charging the Egyptians with maintaining two positions there illegally under the 1949 armistice.

Egypt.—With a loosely organized army of about 100,000 and lacking heavy equipment, Egypt made intensive efforts to obtain arms to match those of Israel. Both countries had obtained about \$1,000,000 worth of arms each from the United States since 1952. Egypt in the meantime had obtained some Centurion tanks, contracted for in 1949, 2,500 light and heavy machine guns from Spain, and bought 200-300 Valentine tanks from Belgium. A down payment of \$2,800,000 was made on arms from Czechoslovakia.

Israel.—As a result of Egyptian efforts to obtain arms from the communist bloc, Israel proposed military ties with Britain, France and the United States. Proposals called for security guarantees, no change in the balance of power, and integration in the western security program. It was maintained that under the 1950 agreement the three major powers had agreed to maintain the balance of power between Israel and the Arab states.

"PRISONERS" AND "ENEMY" CAPTOR, U.S. soldiers at Stead Air Force base, Nevada, where in 1955 a voluntary course in survival techniques was initiated. Soldiers taking the course were treated as prisoners and subjected to mild forms of torture in an effort to teach them to resist the "brainwashing" practised on U.S. prisoners in the far east during and after the Korean war

The United States was requested to match whatever arms the Egyptians got from the communists.

Approximately 50,000 men were maintained on active duty, with an immediately mobilizable reserve of 200,000. Every able-bodied man under 50 was a well-trained and well-equipped reserve soldier. Every Israeli male at the age of 18 and every immigrant under 30 was required to serve 2½ years and thereafter 30 days each year plus one day each month until age 39, thereafter 14 days a year for enlisted men and 21 days for others. All officers were required to qualify as parachutists or guerrilla leaders. Every reservist was assigned to a mobilization centre where weapons, gear and other equipment were stored.

Iraq.—The treaty of 1930 with Britain was abrogated and replaced by the middle east defense alliance, with a bilateral accord covering the royal air force bases at Shaibah and Habbaniya. Under the area agreement Iraq would provide a supply and communications route to Turkey, particularly to the Turkish NATO forces 1st army in Thrace and 3rd army in the Caucasus. Efforts were made to acquire more U.S. equipment, particularly 105- and 155-mm. howitzers. The goal was to modernize the two existing divisions and create a third mechanized division. U.S. vehicles and engineering equipment designed to increase the mobility and improve communications were received.

Jordan.—Troop strength of the Arab legion was maintained at 20,000.

Lebanon.—Troop strength was 5,000.

Pakistan.—The bilateral agreement with Turkey and the mutual security treaty with the United States were supplemented by a formal defense council under the middle east pact. Military headquarters at Rawalpindi commenced the integration of U.S. equipment, including tanks, into the army.

Saudi Arabia.—Troop strength was 15,000.

Syria.—Troop strength was 40,000.

Turkey.—Although the six armoured brigades were equipped with M-47 Patton tanks, the army was still weak in mobility and communications with an outmoded depot and warehouse system and inadequate road and rail transport.

SEATO.—In February at Bangkok the Manila alliance powers established a secretariat to be composed of the ambassadors of the eight powers: Pakistan, the Philippines, Thailand, Australia, New Zealand, France, Britain and the United States. A military staff group was established under the secretariat, and discussions were commenced among the signatories, with meetings in each

M/SGT. EDDIE PICKETT and his family disembarking at Bremerhaven, Ger., in July 1955, as the U.S. 10th division from Ft. Riley, Kan., arrived to replace the 1st infantry division in Operation "Gyroscope," the largest peacetime army movement in U.S. history

of the member countries to survey existing facilities. (See also SOUTHEAST ASIA TREATY ORGANIZATION.)

Communist China.—It was announced that the defense budget equalled 24.19% of the budget of \$12,563,000,000. The government announced the start of compulsory military service and indicated that 450,000 men in the 18 to 22 year old category would be called up for a three-year period. Strength of the army was maintained at approximately 3,500,000, including 1,000,000 security troops. Official announcement was made of the withdrawal of two more armies (six divisions) from Korea, reducing the total number of armies in Korea to ten. There was little change of the major disposition of the armies during the year, with about 400,000 troops in the area between Shanghai and Canton, of which 100,000 were along the Chekiang-Fukien coast—probably the 12th, 20th and 26th armies.

Nationalist China.—A mutual defense treaty was signed with the United States providing for the defense of Formosa and the Pescadores. The army of approximately 300,000 men was reorganized, but it would be late in 1956 before all of the 21 infantry and 2 armoured divisions were combat ready. Discussions were held with the U.S. military assistance group toward equipping reserve divisions, with the Chinese asking for nine. The disposition of the troops remained practically the same except for additional troops in the Quemoy region, where five divisions garrisoned Quemoy, plus one on Little Quemoy supported by 18 battalions of field artillery plus three battalions of light tanks. Conscription of Formosans was started.

France.—Three major developments affected the organization of the army: the long-term plan estimated to cost 1,125,000,000 fr. (\$3,503,500,000) was rejected; a defense budget of 991,000,000,000 fr. (\$2,834,000,000) for 1955, and 997,000,000,000 fr. (\$2,851,000,000) for 1956 were passed with a four-year plan for capital expenditures on military equipment and

long-range organization of industrial orders for heavy equipment and new units of the army were organized to meet the crisis in North Africa. The end of the war in Indochina saved the government 122,000,000,000 fr. with the withdrawal of approximately 100,000 of the expeditionary force. The contribution to NATO of 14½ divisions consisted of 5 active divisions at 80% of war strength and 9½ divisions at 55% of war strength. Of these units four divisions were in North Africa.

Disposition.—With the French forces in Indochina reduced from 175,000 to 75,000, an agreement was reached with the Vietnam government to withdraw from Saigon. As a result, the 75,000 were disposed at Bienhoa, 35 mi. E. of Saigon; Baria, 60 mi. E. on the South China sea coast; with small units at Tourane and Nhatrang at Annam.

In North Africa, nationalist uprisings resulted in a steady flow of troops from the continent to Morocco and Algiers until strength mounted to more than 300,000. Disposition included a foreign legion battalion at Agadir; a Moroccan regiment at Marrakesh; the 6th Moroccan regiment, 6th Senegalese regiment and 7th artillery regiment at Casablanca; the 22nd Moroccan division and 1st African regiment at Rabat; a Moroccan regiment at Port Lyautey; a foreign legion battalion at Fez; a Moroccan regiment at Taza; a foreign legion battalion at Oujda; foreign legion headquarters at Sidi-Bel-Abbès; the 4th infantry division plus an Algerian regiment at Oran; a division plus an Algerian regiment at Algiers; the 2nd infantry division at Tizi-Ouzou; a division plus an Algerian regiment at Constantine; the 1st parachute combat team at Philippeville; and the 14th infantry division at Bône.

The fighting in North Africa consisted of mainly guerrilla-type raids by the Arabs followed by punitive expeditions of the French forces. Nationalist strength was concentrated in the Aures mountain region of the Constantine district of Algeria and in the Riff area along the border of French and Spanish Morocco, where action occurred in the Aknoul-Boured-Ti-Ouzli triangle in an apparent rebel attempt to open a supply route into Spanish Morocco. Although there were occasional surrenders of arms by revolting tribesmen, there appeared to be a steady flow of arms to the Arabs who used both mortars and heavy machine guns against the French forces.

Training.—Reserves were called up to replace the troops sent to North Africa. Conscripts released from military duty between January and March 31, 1955, were recalled, and those eligible for release on Nov. 1, 1955, were retained on active duty for at least four months in view of the crisis in North Africa. The total of approximately 150,000 men replaced the units sent to Morocco and Algeria. Home guard units were organized in Morocco composed of about one-third Moroccans who had served in the French army, and the balance Europeans.

Equipment.—Most heavy U.S. equipment of the units sent to North Africa was left in France, and French equipment was used. The new 7th mobile division at Freiburg was equipped primarily with French equipment: the AMX light tank, EB armoured reconnaissance car, SSiO electronically controlled antitank missile.

Great Britain.—The army budget was \$1,335,200,000 and strength was 400,000. It was announced that the armed forces would be reduced by 100,000 by early 1958, with 20,000 less in early 1956, and a reduction of 40,000 in each of the following years.

Disposition.—With the 3rd infantry division in the United Kingdom based at Colchester in the Eastern Defense command and the 1st infantry division returning from Egypt to be based in the Salisbury plain area of the Southern Defense command plus the Independent Parachute brigade, the strategic reserve reached planned strength. Three armoured divisions and o

infantry division remained in west Germany, while the 10th armoured division was headquartered on Cyprus with one of its armoured brigades in Libya and one in Jordan. Other dispositions included two infantry divisions in East Africa, 20,000 British and colonial troops in Malaya, two brigades in Hong Kong and one battalion in Korea. Approximately 2,500 British and 1,000 African troops were withdrawn from Kenya, leaving 5,000 British and 7,500 African troops to cope with the Mau Mau. There were about 7,000 troops on Cyprus, and the 1st battalion of the Seaforth Highlanders was dispatched to Aden.

Equipment.—New tanks in use included the Charioteer, a cruiser-type tank of 30 tons with a 20-pounder, reported to be faster than the Cromwell. The Conqueror, with a 120-mm. gun and weighing 60 tons, was issued for use in combination with the Centurion (52 tons and 84-mm. gun). New equipment included a 40-mm. Bofors anti-aircraft gun, the Belgian FN 30 automatic rifle and the Sterling 9-mm. submachine gun which weighed six pounds, carried a bayonet, fired 575 rounds a minute accurately up to 200 yd. and carried a magazine of 34 rounds.

United States.—Of the defense budget passed by congress for fiscal year 1956, the share for the army was \$7,329,953,000. Strength of the army was being cut to 1,027,000, organized into 18 divisions, 11 independent regiments and 136 anti-aircraft battalions. Under Operation "Gyroscope" eight divisions would be kept in the United States and rotated with eight overseas, while the other two would remain in the territories. A continental army command replaced the army field forces headquarters.

The 3rd infantry division in Exercise "Follow Me" at Fort Benning, Ga., and the 1st armoured division in Exercise "Blue Bolt" at Fort Hood, Tex., engaged in extensive studies and tests of organizational units under conditions of nuclear warfare. While the final results were not announced, preliminary indications pointed to smaller, self-sufficient component forces, more mobile, with the communications, transportation, maintenance, supply elements and technical services pooled in support commands. While divisions would probably decrease in size, field armies would become larger and echeloned in greater depth. Regiments would disappear and their comparable unit would be the "combat command" while battalions would be replaced by "battle groups" within the destructive range of a single nuclear blast. Mobility would be greatly increased with more helicopters, tanks and armoured infantry carriers. Infantry firepower would be increased by the T-44 rifle, which under tests fired 20 rounds in less than two seconds. The medium artillery battalion—155 mm.—would be eliminated or replaced by mortars.

The increasing importance of army aviation was indicated by the creation of an Airborne and Aviation department at Fort Benning, Ga., and Camp Rucker, Ala., was named the new headquarters of army aviation. The army had 3,000 pilots and 4,000 planes, with 40% of the latter helicopters. The seven helicopter transport companies were to be expanded to 36 by 1959 and would total more than 700 transport helicopters with an average capacity of 20 or more men.

The congress passed the Reserve Forces act of 1955 which increased the statutory size of the ready reserve from 1,500,000 to 2,900,000 including the members of the reserve serving with active forces. Under the act the president could order to active duty 1,000,000 members of the ready reserve without further congressional authorization. The act provided that men between 17 and 18½ could enlist for eight years, serve three to six months on active duty, followed by 7½ years in the ready reserve during which time there would be 48 compulsory weekly drills and two weeks active duty annually. The army planned on 100,000 to

250,000 volunteers a year for this program, with a goal of a ready reserve of 2,900,000 by 1960. Under the new law, a second category could enlist in the reserve for six years, two of which must be spent on active duty, while a third category could join an organized unit of the national guard or organized reserve. (See also SELECTIVE SERVICE, U.S.)

Disposition.—The 1st infantry division and the 2nd armoured cavalry regiment returned to the United States from Germany and were replaced by the 10th mountain division and the 3rd armoured cavalry regiment. The 508th air-borne regimental combat team in Japan and the 187th air-borne regimental combat team in the United States exchanged places in the first mass unit transfer by air lift. The 25th infantry division took up its permanent post in Hawaii after leaving Korea. Headquarters and the 34th regiment of the 24th infantry division were transferred to Japan from Korea, while the 19th and 21st regiments remained in Korea where together with the 1st cavalry and 1st marine division they constituted the major U.S. combat units.

Training.—Extensive training exercises were conducted in nuclear warfare. At the atomic proving ground in Nevada, Task Force "Razor," composed of tanks and troops of the 723rd heavy tank battalion, conducted the first test of the tactical use of the atomic bomb in breaking an enemy line under actual blast conditions. Other notable training exercises included paratroopers from the 11th air-borne division participating in an exercise to reinforce the Panama Canal Zone, and the 503rd regimental combat team engaging in arctic manoeuvres in Alaska. Training was commenced for all troops in courses of action to be followed when captured, how to resist or avoid interrogation, specializing in escape and evasion, resistance, prison organization and survival.

U.S.S.R.—An announcement was made of an increase in the national defense budget for 1955 over 1954—\$28,250,000,000 compared with \$27,750,000,000. An eastern European unified command under Marshal Ivan S. Koniev was created, and a mutual defense pact signed by the U.S.S.R., Poland, Czechoslovakia, Hungary, Rumania, Bulgaria, Albania and the German Democratic Republic. However, each country retained command of the forces allotted to the unified command. A cut of 640,000 men in the armed forces was announced, but was not believed to affect the total of 110 infantry and 65 armoured

CLEAN UP SQUAD at Ft. Jay, Governors Island, N.Y. Shown in the photograph are members of the Ceremonial detachment who demonstrated their precision drilling with brooms instead of guns before all available personnel turned out to clean up the base in preparation for an open house on Armed Forces day in May 1955

divisions. The garrison of 45,000 was withdrawn from Austria. New field guns of 150-mm. calibre and T-54 tanks were delivered to the forces in Germany.

Australia.—Australia spent 20% of the national budget, or \$440,000,000, for defense. The regular army consisted of 24,230 officers and men, with 95,120 army reserves in the citizen military forces. New equipment ordered for the army included vehicles, rocket launchers, Energa rifle grenades and 120-mm. antitank weapons. Plans were developed for a modern arms plant near Sydney to cost \$50,000,000.

Colombia.—The army was maintained at a strength of approximately 40,000. The battalion that fought in Korea returned home.

Canada.—The 25th infantry brigade returned home from Korea.

Czechoslovakia.—A cut of 34,000 in the army strength of 230,000 was announced.

Denmark.—The defense budget was approximately \$126,000,000. The army had two divisions of 5,000 men each, one stationed in Jutland and one on the island of Sjaelland near Copenhagen. There was a garrison of 800 on Bornholm, and a reinforced battalion of 1,500 in Schleswig-Holstein (which together with an understrength British regiment constituted the NATO shield forces).

East Germany.—An army of 85,000 divided into a northern army corps of 30,000, a southern army corps of 25,000 and the Potsdam division of 10,000 was equipped with more than 1,500 light and heavy tanks including the Stalin Mark II plus howitzers, anti-tank guns, anti-aircraft guns and mortars. Plans were made to expand the force to 300,000.

West Germany.—The defense budget for the first year of rearmament was set at \$2,143,000,000. A Civilian Defense council was established to direct the armed forces. A conscription bill was drafted which would subject all Germans to conscription: those between 18 and 45 to peacetime service—young conscripts to 18 months' service, World War II veterans under 35 to six months and those over 35 to two months. Six representatives, who would be commissioned when the necessary laws were passed, were sent to SHAPE headquarters. The schedule for rearmament was as follows: 6,000 officers and noncommissioned officers on duty by late 1955; recruitment of 150,000 professionals by mid-1956; first conscripts by 1958; a combat-ready ground force by 1960. The ground force would include six armoured divisions of 12,800 men each and a total of 3,000 tanks, six mechanized infantry divisions of 13,600 men each, and three air-borne brigades of 5,000 men each. The infantry divisions would be organized into seven battalions and two combat commands, and each division would have 600 armoured personnel carriers transporting 12 men each. The 12 German divisions would be organized two to a corps, with four corps assigned to the central front and the fifth to Schleswig-Holstein.

Hungary.—A cut of 20,000 men in the army of approximately 300,000 was announced.

Japan.—Defense expenditures came to 3% of the national budget, or \$283,000,000. Defense forces totalled 168,000 and an annual increase of 10,000 was planned, directed toward reaching a ground force of 183,000 by 1958. The ultimate goal was the withdrawal of U.S. forces by 1960.

North Korea.—Reports indicated that there were more than 500,000 in the army, with an additional 1,000,000 or more Chinese communist troops. These troops had 2,000 pieces of artillery, organized into three divisions and one brigade.

South Korea.—A strength of 660,000 was maintained, with 22 active divisions and six more in the process of organization. The 1st army with the 1st, 2nd, 3rd, 5th and 6th corps held the demarcation line. The divisions totalled 13,000 men with tank

U.S. WORLD WAR II VETERANS before Lomonosov State university, Moscow, U.S.S.R., in May 1955. The soldiers, members of the U.S. division which met the Soviet forces on the Elbe river in 1945, were guests of the U.S.S.R. government

and heavy artillery battalions assigned only to corps.

Norway.—Norway maintained an army of about 20,000, with the major unit being the Northern brigade which was stationed north of the Arctic circle along the Lyngen line established by the Germans in World War II, running from Skibotn on the Lyngen fiord to the Finnish frontier.

Philippines.—The last unit of the Filipino battalion in Korea a reinforced rifle company, was withdrawn. An agreement was signed with the U.S. calling for \$9,500,000 to train and equip a new division.

Poland.—A cut of 47,000 in the army of 500,000 was announced.

Rumania.—A cut of 40,000 men in the army of 230,000 organized in 15 divisions was announced.

Sweden.—The defense budget was unchanged at \$395,000,000. All branches of the service were being trained for nuclear warfare. New tactical rules were issued. Improved shelters were being built in solid rock. Army units were being made more mobile without sacrificing firepower. Art Exhibitions. During 1955, exhibitions from Europe again offered a rich and varied fare for the museum visitor in the United States. Spain sent its first group of art treasures, 100 drawings by Francisco Goya lent by the Prado museum, with 15 more from the Goldiano museum of Madrid. These were shown at the National Gallery of Art in Washington, D.C., and later went to the Metropolitan Museum

of Art in New York city, the De Young Memorial museum in San Francisco and finally to Los Angeles and to the Museum of Fine Arts in Boston.

Through the auspices of the Smithsonian institution in Washington, D.C., a group of drawings and prints from the world-famous Albertina collection in Vienna were brought to the United States and were especially featured at the National Gallery of Art and at the Minneapolis (Minn.) Institute of Arts.

The finest collection of old masters to come to the U.S. in several years was the group of about 70 Dutch paintings of the 17th century lent largely from museums and private collections in the Netherlands with a few additional examples from England and Scotland. These were augmented by about 30 important examples from American collections. The exhibition was shown at the Metropolitan museum, the Toledo (O.) Museum of Art, and in Toronto, Can.

A great collection of French drawings, 14th to late 19th century, was lent to the Art Institute of Chicago, selected from the Louvre in Paris and from other French collections by Mme. Buchot-Saupique, the Louvre's Curator of Prints and Drawings.

A superb group of German old master drawings was assembled by the museums of western Germany and sent to the National Gallery, the Cleveland Museum of Art, the San Francisco Museum of Art and the Fogg Museum of Art at Harvard university. These were about 150 drawings from 20 museums and four collectors covering the period from the 14th to the 20th century.

Revival of interest in the British portrait school was indicated by the important exhibition held at the Columbus (O.) Gallery of Fine Arts of "Sir Thomas Lawrence as Painter and Collector." His brilliance as a painter was already apparent at the age of ten, when Sir Joshua Reynolds called him "the most promising genius" he had ever met. Lawrence owned works by Raphael, Leonardo and Michelangelo.

The Los Angeles County museum and the San Francisco Museum of Art assembled a most comprehensive exhibition of the work of Auguste Renoir, covering a period from 1865 to his death in 1919. In addition to oils, drawings, prints, pastels, watercolours and sculpture were included.

Ancient art came into prominence when the Fogg museum at Harvard university honoured the 75th anniversary of the Archaeological Institute of America with a showing of ancient art in American collections. The Yale Gallery of Fine Arts exhibited Palmyrene and Gandharan sculpture to show the mingling of eastern and western traditions in the early centuries of the Christian era.

"Sculpture in Silver from Islands of Time," organized by the Brooklyn museum, was composed of silver sculpture under 12 inches high, comprising 22 ancient, Renaissance or Peruvian pieces combined with pieces commissioned from contemporary sculptors José de Creeft, Ibram Lassaw, Richard Lippold, David Smith and William Zorach.

The Cloisters of the Metropolitan museum organized a Spanish mediaeval exhibition of paintings, sculpture, manuscripts and textiles to honour Walter W. S. Cook, scholar in the field of Spanish art and for many years the director of the graduate institute of Fine Arts at New York university.

A notable exhibition of manuscripts was shown at the Houghton library at Harvard. Most of the 165 items had been procured by Philip Hofer, the librarian, and covered the period from the 10th to the 17th century. A highlight was a famous Gothic manuscript, the Missal of Noyon.

The Cleveland (O.) Museum of Art organized an outstanding exhibition of Chinese landscape painting, 117 works covering 3,000 years. Earliest was from an incised ewer of the Chou dynasty, 5th to 3rd century B.C., while the greatest landscapes were of the Sung dynasty, 10th and 11th centuries.

PASSER-BY PAUSING to examine a bronze statue which was to be exhibited in the 4th annual Boston (Mass.) Arts festival, 1955. In addition to sculpture, painting, architecture, poetry reading, dancing and theatre were presented

The Art Institute of Chicago honoured Chauncey McCormick, its former president, who died in 1954, with an extremely choice group of 39 French paintings, mostly of the 18th century, and Impressionist and post-Impressionist pictures of the 19th century.

The Baltimore (Md.) Museum of Art celebrated "25 Years of Growth," 200 of their choicest objects acquired since their founding. Most notable benefactors were Sadie A. May and the Cone sisters, whose Henri Matisse "Blue Nude" is world famous.

A great exhibition of photography, called "The Family of Man," was assembled by Edward Steichen for the Museum of Modern Art in New York city and a dramatic installation was designed by Paul Rudolph. Enlarged photographs of every phase of life from birth to death in all parts of the world were included.

The Pennsylvania Academy of the Fine Arts, Philadelphia, celebrated its 150th anniversary with an exhibition composed of groups of paintings by their 25 most eminent pupils and teachers (no living artists included). Founded in 1805 by Charles Willson Peale, the academy had as teachers not only Peale but later Thomas Eakins, and as pupils notables including Mary Cassatt, William Glackens, John Marin and Charles Demuth.

In the new building on West 54th street, New York city, the Whitney Museum of American Art combined its two annuals into one large exhibition of oils, watercolours, drawings and sculpture. A renewed interest in figure painting was evinced in this all-invited, no-prize exhibition.

The Chicago Art institute's 61st annual was also all-invited and the prizes were awarded by James Johnson Sweeney, director of the Guggenheim museum, New York city, and two notable painters, Stuart Davis and George L. K. Morris. The \$2,000 Logan prize went to Corrado Marca-Relli for an enigmatic double-figure cloth collage.

For the Corcoran Gallery of Art's 24th biennial in Washington, D.C., only 64 paintings were taken by a very strict jury. The W. A. Clark prize went to John Hultberg for "Yellow Sky";

"WHITE TOWER HAMBURGER," a wash drawing by Reginald Marsh (1898-1954) from the 1955 memorial show of Marsh's work, Whitney Museum of American Art, New York City

the next three prizes in order went to Ivan Albright for "Tin," Larry Rivers for "Figure" and Henry Niese for "The Window."

Carnegie institute's 40th international at Pittsburgh (328 artists from 23 countries) was all-invited by Director Gordon Washburn. The prize jury of five, consisting of René Huyghe, former curator of the Louvre; Afro, Italian painter; Perry Rathbone, new director of Boston's Museum of Fine Arts; Ben Shahn, U.S. painter; and G. David Thompson, Pittsburgh collector, rolled about the galleries in wheel chairs for greater ease, and awarded the first prize of \$2,000 to Alfred Manessier of France for "Crown of Thorns"; second prize of \$1,000 to Rufino Tamayo of Mexico for "Fruit Vendors"; and lesser prizes to Renato Birilli (Italy), Matta (Chile) and Toti Scialoja (Italy).

The *Art News* sponsored the fifth National Amateur competition and awarded the gold medal to Mrs. Gertrude Harbart, a housewife of Michigan City, Ind., for "Mixed Bouquet"; silver medals went to David Goldstein, a Brooklyn dentist, for "Curio Shop," and to Mrs. Sali Frantz of Saginaw, Mich., for "Open Door—Just Watching."

Contemporary Americans and Europeans could be compared through two exhibitions showing the work of 22 European artists at the Museum of Modern Art and 35 Americans at the Whitney museum. The consensus was that top Americans, like Willem de Kooning, Jackson Pollock, Robert Motherwell and Adolph Gottlieb, were more vital and original than the best Europeans, such as Jean Dubuffet of France and Francis Bacon of England.

The Whitney museum showed a memorial exhibition of the work of Reginald Marsh (1898-1954), noted chronicler of the more lusty side of New York life, the Bowery, Coney Island, Fourteenth street and the burlesque. His early death at the age of 56 brought to an end one of the most distinguished careers of any artist in America.

Retrospective exhibitions were held at the Museum of Modern Art of Giorgio de Chirico (Italian, 1888-) and Yves Tanguy (French, 1900-1955), both organized by James Thrall Soby. Their moody, imaginative pictures were important in the development of the surrealist movement. (F. A. Sw.)

Great Britain and Europe.—In London, from Nov. 1954 until the end of Feb. 1955, the Royal Academy of Arts presented

another of its winter exhibitions. The title "European Masters of the Eighteenth Century" was chosen deliberately to indicate that the exhibition was not intended to be a balanced and representative showing of 18th century art. There was, for example, an undue weight of pictures by Canaletto and Guardi. The former, however, had a special interest for Londoners. Canaletto's topographical view of Whitehall and the Thames is amazingly precise in detail yet wonderfully broad in design. It gave an uncannily vivid idea of the capital as it was 200 years ago. There were excellent and characteristic works by Boucher, Chardin, Fragonard, Watteau, Gainsborough, Hogarth, Reynolds, Romney, Stubbs, and, for first-rate Goya portraits and,

a pleasing reminder of a highly skilled but half-forgotten painter, three dramatic pictures, in the manner of Caravaggio, by Joseph Wright of Derby.

In Paris, in February, the Petit Palais presented 100 pictures by Courbet. The exhibition included most of the 53 works that were shown at the Venice Biennale in 1954; the remainder came from the Petit Palais itself. The reinstatement of Courbet as a significant figure was an interesting comment on the tendency toward realism apparent among the younger generation of painters—a tendency that was emphatically underlined by the complete disappearance of abstract painting from the Salon de Jeune Peinture in January.

During January and February the Musée National d'Art Moderne showed about 60 paintings and 20 drawings by Ben Nicholson in a survey which covered every phase of his development from the time of his first one-man show in London. In March this exhibition was shown in Brussels, at the Palais des Beaux-Arts where, shortly after, there was a selection of paintings by the German Franz Marc. Marc, who was killed in World War I, is widely remembered for his much reproduced picture "Three Horses," but for little else.

In the Netherlands, in February, the Gemeentemuseum at The Hague showed 120 works by Pieter Mondriaan, probably the most accomplished exponent of abstract painting. The exhibition traced his gradual discarding of naturalistic elements and revealed his intensifying preoccupation with nonfigurative design. This survey of Mondriaan's output emphasized the considerable extent of his influence, not only on painting, but on interior and industrial design as well.

In London, during April, the Leicester galleries showed pictures by the prolific and bewilderingly variable André Masson. The Institute of Contemporary Art presented the crudely vi-
pictographic symbols of Jean Dubuffet, and at the Lefevre gallery there were Edward Burra's haunting illustrations of his private world. As a contrast to the highly personal visions of these three subjective painters, Londoners were able to see an impressive record of the works acquired during the past 20 years by Liverpool's Walker Art gallery. Among the purchases of old masters were a fine Murillo and two excellent portraits, one by Van Dyck of the Infanta Isabella and the other by Gainsborough of Sir Robert Clayton. The 20th century acquisitions included a sensitive painting of a skull by Victor Pasmore, A

brose McEvoy's portrait of his mother, a notable "Paddington Interior" by Lucian Freud and an admirable work by Harold Gilman.

In June, the outstanding event was the great exhibition of paintings by Giorgione and his followers at the Palazzo Ducale in Venice, It. Perhaps no painter's name has provoked so many arguments over questions of attribution. With this in view, the exhibition was arranged with the intention of showing the greatest number of reasonably authentic Giorgiones, together with a selection of other paintings which bore the unmistakable stamp of his influence.

Another commemorative exhibition in June was a retrospective show at the Musée des Arts Décoratifs in Paris which paid tribute to Picasso's 75th birthday and to the 50th anniversary of his arrival in Paris.

Throughout August, exhibitions in London and Paris were numerous and important. In Paris, the Maison de la Pensée Française presented a wonderful show of paintings by Pierre Bonnard; the Musée d'Art Moderne included further Bonnard canvases in an exhibition called "Bonnard, Vuillard et les Nabis (1888-1903)," and the Galerie Charpentier showed 60 paintings by André Derain. In London, 50 paintings by William Etty were to be seen at the Arts Council's gallery and the Council's exhibition of "Four French Realists" (André Minaux, Ginette Rapp, Roger Montané and Jean Vinay) opened at the Tate gallery. Meanwhile, in Edinburgh, a magnificent collection of paintings, sculpture and graphic work by Paul Gauguin was on view as part of the city's festival. The whole exhibition, together with one or two additions, was transferred to the Tate gallery in September.

In London, the year ended as it began with the winter exhibition of the Royal academy which was devoted to a comprehensive collection of Portuguese art of all periods. (See also ART SALES; MUSEUMS.) (F. W. W.-S.)

Art Sales. During 1955 America's leading auction house, the Parke-Bernet galleries in New York city, in a season of 77 sales totalled \$5,447,634, nearly \$1,250,000 above the previous season. Auction trends were an indication of the economic changes of the country in that the truly great collections of the past had been mostly broken up and replaced by many smaller collections. There continued to be a great interest in modern art, and early Americana, though growing increasingly rare, was in constant demand. While Renaissance furniture, once so much collected, seemed to be no longer desired, there was a great interest in all sorts of *objets de vertu*.

Notable sales were Ruth Vanderbilt Twombly, rugs and tapestries, which brought \$315,185; Katherine Deere Butterworth, old masters, Barbizon school paintings and French furniture, which fetched \$315,185; Alfred H. Caspary, English and American furniture and silver, \$192,747; and Arthur Bradley Campbell, modern paintings, \$162,620. The single painting which brought the highest price of the season was the Pieter de Hooch "Woman Nursing Her Child" from the Butterworth collection, which brought \$34,000. Top modern paintings were Chaim Soutine's "The Old Mill Near Cannes," bringing \$20,500, and Paul Cézanne's "The Water Can," \$19,000. Two series of Louis XIII tapestries, "Rinaldo and Armida" (set of ten) and "The Story of Amintas and Sylvia" (set of eight), went for \$15,000 each

A season's total of \$2,054,739 was taken in by the Plaza Auction galleries in 65 sales. Important sales were the estates of Helen W. Durkee Mileham, Mary Osgood Field Hoving, William H. Coverdale and Arcie Lubetkin.

A lively season was seen in the London auction houses. At Sotheby's 14 drawings were sold by A. G. B. Russell for £15,190, of which Lorenzo Lotto's "Portrait of a Young Man" brought £8,000. Of the drawings from the estate of the Misses Hunte, a pen and ink by Francesco di Giorgio brought £9,500, and a pen and ink by Giovanni Bellini, £4,000. An elephant portfolio of James Audubon's *Birds of America* fetched £9,200.

At Christie's 127 lots from the estate of William Rees Jeffreys fetched £56,344. Highest items were modern pictures: "Portrait of André Derain" by Henri Matisse, £7,035, purchased for the Tate gallery (cost £280 in 1935); "Elderly Woman in a Blue Dress" by Chaim Soutine, £4,725 (cost £90 in 1939); "La Sibyl," an early Picasso, £4,410; "A Woman at Her Toilet" by Pierre Bonnard, £4,410; "The Port of Antwerp" by Eugène Boudin, £3,990.

Highlights of the sale of the Viscountess Bertie of Thame were two small (9½×14 in.) Guardi panels, "San Giorgio Maggiore," which brought £2,730, and "The Dogana and Church of Santa Maria della Salute," £3,360. (In 1885 the pair cost £147 at auction.)

The Baroness van Zuylen van Nyevelt sold nine Nymphenburg porcelain figures, c. 1760, by Franz Bustelli, for £35,647. Two of these, "Lalage" and "Harlequin," went as a pair for £11,130.

An anonymous nobleman sold a painting, "Democritus and Heraclitus," attributed to Rubens, for £17,325. English and French furniture from the collection of Ernest Rehnitz realized £34,000, of which a Louis XVI black lacquer *bonheur-du-jour* brought £5,460.

"A Seated Nude" by Pierre Bonnard sold at the Galerie Charpentier in Paris for 4,055,000 fr., "Young Lady in a Landscape," 1831, by Jean Baptiste Corot brought 10,750,000 fr. and a set of ten chairs and a sofa signed Heurtaut (cabinetmaker to Louis XV) brought the unprecedented amount of 18,000,000 fr. Old masters fetched less than old furniture, as indicated by 1,500,000 fr. received at auction for Lucas Cranach's "The Old Man Agrees." (F. A. Sw.)

Asian-African Conference. At Bandung, Indonesia, representatives of 29 Asian and African countries met from April 18 to 24, 1955, to discuss their common problems. Long expected to be a rally of the Asian neutralists with the communist bloc, the conference surprised observers in many countries with the freedom of its discussion, the vigorous defense of the western democracies set forth by many speakers, and the variety of the viewpoints expressed.

Originally, the conference was put officially on record by a proposal of Prime Minister Ali Sastroamidjojo of Indonesia in March 1954. The following May the premiers of the Colombo powers approved the participation of their countries in such a conference and at the Bogor, Indon., conference, held in a suburb of Djakarta in Dec. 1954, the list of countries invited was drawn up and the preparation for official invitations made. Though invitation was made at the instance of Indonesia, the

Colombo powers associated themselves with the calling of the meeting.

The label "Asian-African" was not altogether accurate. Important Asian countries, such as the Soviet republics in Asia, were not represented and only five African countries took part. The conference was in substantial part a meeting of former colonial territories. Much of the discussion involved the background of colonialism and the foreground of the cold war.

The three most powerful nations represented were Japan, Communist China and India. Of these Japan was by design the most inconspicuous. The Japanese offered high principles and diplomatic courtesy, but it was evident that they were not interested in involvement with either the anti-colonial wrangle or the recriminations between the friends of the eastern and the western powers. That left Communist China and India in the position of leading powers.

Even the anti-communist press of the world later conceded that Red China stole the show through the performance of its premier and foreign minister, General Chou En-lai. Chou was expected to vilify the west and to launch harangues against the United States. Instead, he took a tone of reasonableness and supported the moralistic affirmations of the Asian neutrals, and in giving them a communist slant he proceeded with considerable calm and candor.

On the part of India, Prime Minister Jawaharlal Nehru was the leading initiator of the conference. He did not control it, and much of the spotlight fell on Chou, but the meeting was in general the kind of meeting for which Nehru's policy had striven.

From a formal point of view, the conference was a legal and proper meeting of many governments—called at the invitation of the Indonesian government in association with other Asian powers—to discuss matters of common concern.

The list of the 29 participating countries showed curious inclusions as well as omissions. It comprised: Japan, Communist China, north Vietnam, south Vietnam, Cambodia, Laos, Thailand, the Philippines, Indonesia, Burma, Pakistan, India, Ceylon, Nepal, Afghanistan, Iran, Iraq, Turkey, Syria, Lebanon, Jordan, Yemen, Saudi Arabia, Egypt, Libya, the Sudan, Ethiopia, the

"LOOK-ALIKES," a 1955 cartoon by Justus of the Minneapolis Star

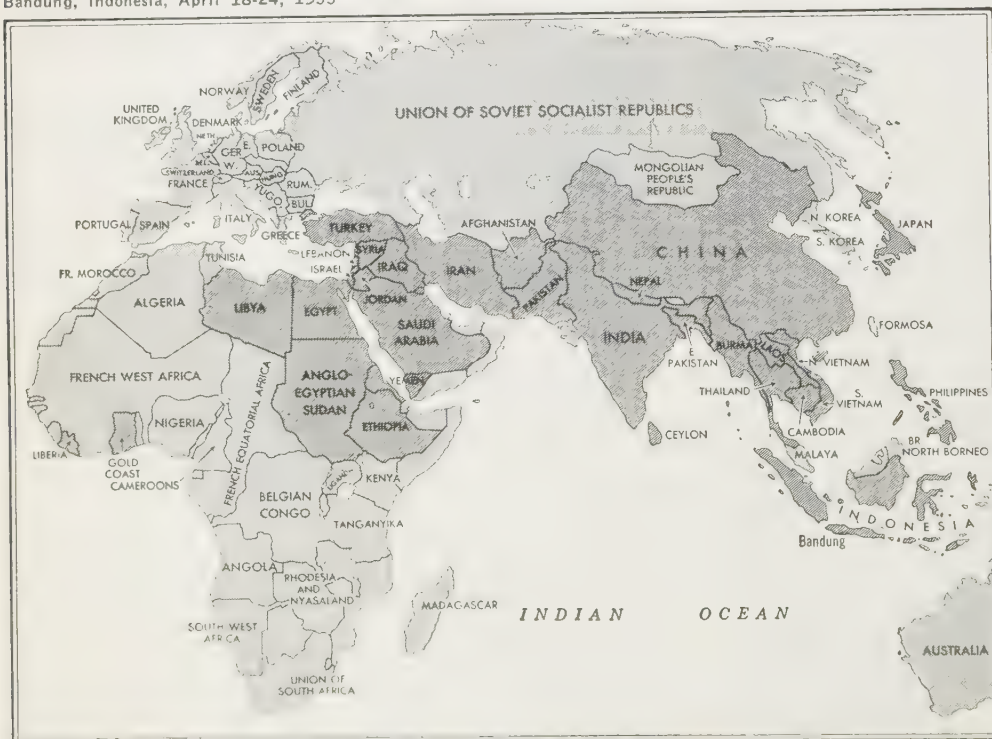

Gold Coast and Liberia. The Central African federation, which was British-founded, was invited but did not participate. However, neither north Korea nor south Korea was invited, nor were Nationalist China, Israel or the Union of South Africa.

Almost all the major nations of the world, with the exception of the Latin-American states, were represented by unofficial delegations or by semiofficial journalists. The United States was present in the person of Rep. Adam Clayton Powell (Dem. N.Y.), himself of African descent.

The democratic point of view was vigorously expounded by Gen. Carlos P. Romulo of the Philippines, by Sir John Kotelawala of Ceylon, by Prince Wan Waithayakon of Thailand and by others.

The conference opened on April 18 and the host, Indonesia's premier Sastroamidjojo, was elected chairman. He and Chou sought to keep the conference calm and orderly, although on the second day discord broke out when pro-western speakers challenged the communist ideology and questioned the methods of communist governments. During the remainder of the conference sustained efforts were made to achieve a substantial degree of unity on the basic issues before the meeting, most of which did not directly concern the cold war. The communists won a considerable degree of approval when Premier Chou stated that he had no intention of bringing

MAP SHOWING nations participating in the Asian-African conference at Bandung, Indonesia, April 18-24, 1955

DELEGATES Tatsunosuke Takasaki, Japan (left), and Gamal Nasser, Egypt, greet each other at Bandung, Indonesia, as the statesmen assembled for the opening of the conference in April 1955. Premier Chou En-lai of China appears directly behind their clasped hands

p quarrelsome subjects: he did this by mentioning, one by one, the controversial subjects which his country did not wish to inject into the discussion.

Prominently discussed at the conference were five highly moral principles worked out by Chou En-lai and Nehru on a previous occasion. These were sometimes cited as the five guiding principles, to which Chou at the conference added a sixth and a seventh. The five principles were: respect for national sovereignty; nonaggression; noninterference by nations in one another's affairs; recognition of racial equality; and the equality of nations. Chou's two new principles were respect of each country for the other's way of life and abstinence by nations from damaging one another economically or otherwise. These principles could have been approved almost anywhere in the world, but their manner of presentation and interpretation left no room for doubt that they were aimed at the United States.

The conference ended on April 24, the last several days having been taken up by committee work. Unlike the SEATO (Southeast Asia Treaty organization) conference, which resulted in a pact and a defense organization, the Bandung conference ended with no organization being established, no commitments made other than general good will, friendliness and possible cooperation, and no legal instrument more binding than an eloquent communiqué. The conference affirmed that Chou's seven points, plus three more supporting peaceful settlement of international disputes, the promotion of mutual interest, and respect for justice, would lead to friendly co-operation which could effectively contribute to the maintenance and promotion of international peace and security while co-operation in the economic, social and cultural fields would help bring about the common prosperity and well-being of all."

For the pro-democratic Asian states, the communiqué represented a triumphant compromise, since Chou's sixth point, concerning pressures, was split into two subpoints, each with a sharp edge: "abstention from the use of arrangements of collective defense to serve the particular interests of any of the big powers" and "abstention by any country from exerting pres-

ures on other countries."

This was characteristic of the conference in its seriousness, its solemnity, and its preoccupation with the ideals of an emerging world. (See also SOUTHEAST ASIA TREATY ORGANIZATION.)

Astronomy. The year 1955 was characterized by important reorganizations in two astronomical agencies, by observational treats in the form of a near-maximum-duration total eclipse of the sun and several naked-eye comets, by announcement of several new conclusions about components of the solar system, and by widespread continuing research in most phases of stellar and galactic astrophysics. Radio astronomy, increasingly important, contributed several new concepts and discoveries.

Mergers.—Harvard College observatory and the Smithsonian institution announced the merger of their facilities for the study of the sun. F. L. Whipple, chairman of the department of astronomy at Harvard, was appointed director concurrently of Smithsonian's Astrophysical observatory, and each staff would have access to equipment and observatories of both, including Smithsonian's mountain stations in Montezuma, Chile, and Table Mountain, Calif. Harvard also figured in an international merger. Its Boyden station in the Union of South Africa would in the future be shared with observatory staffs from Stockholm, Swed.; Uccle, Belg.; Hamburg, West Germany; Dunsink, Republic of Ireland; and Armagh, North. Ire. Co-operative use of the 60-in. reflector and 32-in. special type Schmidt telescope would lead to further study of the southern skies.

Another step in international co-operation was reflected in the announcement that the British and United States Nautical almanac offices would co-operate more fully through sharing of materials prepared by both.

Eclipse.—The longest total solar eclipse since A.D. 717 took

place on June 19–20, 1955. Though it reached a duration of 7 min. 7.8 sec. in the South China sea, it was disappointing. Unlike the much shorter eclipse of June 30, 1954, which passed over land for much of its length, the umbral shadow began in the Indian ocean and ended in the South Pacific. Only Ceylon, Thailand, Indochina, the Philippines and a few scattered islands were in its path. Optimistic astronomers, many of them with elaborate and costly equipment, stationed themselves in these vantage points, chiefly in Ceylon where mountains appeared to offer the best protection against the annoying cloudiness of the southwest monsoons. Preparations had been made for a wide range of research ventures: to measure again the Einstein-predicted bending of starlight around the sun, to determine coronal temperature, to detect possible changes in temperature and concentration of atmospheric ozone, and many others. However, eclipse day in Ceylon was cloudy, and the careful preparations proved futile.

Comets.—For the first time in many years, several comets made a naked-eye or small-telescope appearance. By the end of the summer, seven of these diffuse members of the solar system had been observed with sufficient care that the elements of the orbits could be calculated. Antonin Mrkos, working at the Skalnaté Pleso observatory in Czechoslovakia, discovered Comet 1955e on June 12 near the bright star Capella. It was already of magnitude 6, a diffuse object, with central condensation or nucleus, moving northeast. By the middle of August it had moved through the constellation Canes Venatici and was of magnitude 8 (magnitude 6 is the dimmest visible without telescopic assistance). While it was being watched, another Comet (1955f) was observed in the constellation Pegasus. It was of 8th magnitude. Discovery was credited to A. Bakharev of Stalinabad. Independently and only a few hours later amateurs Karl Krienke and Lewis Macfarlane of Seattle, Wash., sighted the same object and reported it by telegram to the astronomical information centre at Harvard College observatory. Their report actually reached Harvard shortly before the message from the U.S.S.R.

On July 29, M. Honda of the Kwasan observatory in Japan detected Comet 1955g. It reached 6th magnitude in mid-August while in the constellation Auriga.

Mars.—Following an intensive telescopic survey of the planet Mars during the summer of 1954 when it was in favourable opposition, several new discoveries were reported. Yellow-light photographs made by E. Pettit and R. S. Richardson with the 100-in. telescope revealed a huge area that since last seen clearly in 1952 had changed to the characteristic greenish tint of the Martian maria. They also reported a cloud that for a month appeared to re-form each afternoon and disappear each night. W. Sinton and J. Strong made radiometric determinations of surface temperatures, concluding that range is from 77° F. at the equator shortly after noon, to –58° F. in the same location at sunrise. Veteran Mars observer E. C. Slipher, working at Lamont-Hussey observatory in Bloemfontein, S.Af., acquired excellent photographs in light of various wave lengths, including some of Martian cloud belts. Other researchers also reported good seeing, and most were planning to follow up with further investigation of the red planet during its even more favourable opposition in the summer of 1956.

Venus.—Attempts to find evidence of water vapour in the spectrum of Venus had failed. For this reason, it had been conceded by many for several decades that this nearby world is a hot, arid, wind-swept dustbowl. However, polarization studies of the planet by B. Lyot and his successors indicated that water droplets fit his data; dust particles do not. F. L. Whipple and D. L. Menzel therefore revived the theory that water may exist at the planet's surface.

The dense clouds have never permitted a direct view of the surface. Therefore the period of rotation and the orientation of an axis are unknown. G. P. Kuiper, having made a long series of photographs in ultra-violet light, identified atmospheric bands which he believed might be the product of rather rapid rotation of "only a few weeks." He also concluded that the planet's equator is inclined 32° to its orbit, and that the north pole is directed toward a point in the constellation Cepheus.

Jupiter.—This huge planet may have atmospheric electric disturbances of sufficient intensity to radiate signals to earth. But whatever the cause, the huge radio telescope at Seneca, Md., station of the Carnegie Institution of Washington had been receiving signals at a wave length of 13.5 m. which must have originated at the planet, according to K. L. Franklin and B. F. Burke.

New Stars?—The T Tauri type of variable star had been recognized as a nonconformist since 1946, when A. H. Joy noticed that these stars are associated with nebulosities wherever they are found. Equally important, their spectra are non-typical, exhibiting very strong emission lines in a pattern that is more complex than for most other emission-line stars. Recently, G. Herbig proposed cautiously that he had found two of these T Tauri stars in the nebulosity near Orion's sword, where previous photographs revealed no stars, and speculated that they may have developed within the past few years. If so, it marked an important first chapter to a chronological account of stellar evolution. T Tauri types may be the key to a new cosmology.

Red Shift.—Following a 20-year study of about 800 galaxies, M. Humason, N. U. Mayall and A. R. Sandage found new evidence to support the theory of an expanding universe. Sandage stated that the study shows "all galaxies for which data are available partake of the general expansion of space and obey Hubble's linear law," and that each galaxy appears to be receding from others and with a speed directly proportional to distance from the Milky Way. Some distant galaxies appear to be receding with velocities up to 38,000 mi. per second. The possibility exists that the apparent red shift is not produced by actual galactic recession, but by some unknown phenomenon.

Atlas.—The long-awaited first prints of the National Geographic society-Palomar Observatory Sky survey were distributed during September. These superb charts, made with the 48-in. Schmidt telescope, would serve as a basic reference for many years to come. (See also NATIONAL GEOGRAPHIC SOCIETY, p. 10.)

Atomic Energy. A new chapter in the history of atomic energy began in 1955 with a series of events that shifted major attention of the world from the military to the peaceful applications of atomic energy. These included the signing by the United States of bilateral agreements with 27 nations for co-operation in the civil use of atomic energy, the first International Conference on the Peaceful Uses of Atomic Energy and the initiation by the United States of negotiations for the creation of an international atomic energy agency to foster and supervise such peaceful development.

The changed atmosphere of the atomic world was believed to result in considerable part from the realization by the Soviet bloc as well as the western powers that the time had arrived when a war fought with nuclear weapons could only end in mutual destruction and the collapse of civilization, if not the extinction of the human race.

Below left: SPECIAL REPORTS being assembled for shipment to foreign technical libraries by employees of the information section of the U.S. atomic energy plant at Oak Ridge

Below: LAUNCHING of the "Sea Wolf," second U.S. atomic powered submarine, July 21, 1955, at Groton, Conn.

However, there was no relaxation in the development of nuclear weapons. Tests were held by both the United States and the U.S.S.R., and Great Britain announced its intention of holding such tests in 1956.

It must also be noted that the United Nations subcommittee on disarmament had made little progress up to the end of Sept. 1955.

Atoms for Peace.—The progress of developing peaceful uses for atomic energy in 1955 had its inception in an address by Pres. Dwight D. Eisenhower before the general assembly of the United Nations on Dec. 8, 1953. In this address he proposed the creation of an international pool of atomic fuel for peaceful purposes and an international agency affiliated with the United Nations to administer it.

The way for United States participation in such a program was cleared by congress on Aug. 17, 1954, with the passage of the Atomic Energy Act of 1954, revising the original act of 1946. Secretary of State John Foster Dulles discussed the plan further before the United Nations general assembly on Sept. 23, 1954, and proposed that the assembly consider the advisability of an international conference on atomic energy in 1955.

On Dec. 4, 1954, the United Nations general assembly approved both President Eisenhower's proposal for an international agency and the suggestion for an international conference. Dag Hammarskjöld, secretary general of the United Nations, appointed Gunnar Randers of Norway as his special consultant in arranging the conference. Subsequently he appointed an advisory committee consisting of delegates from the United States, the U.S.S.R., Brazil, Canada, India and France.

Bilateral Agreements.—By July 1955, the United States had effected bilateral agreements on atomic energy with 27 nations. Of these agreements, 23 were essentially similar, providing that the United States would furnish the necessary information for the construction and operation of a nuclear reactor for research purposes and also would lease a sufficient amount of enriched uranium for its operation. Such agreements were made with Argentina, Brazil, Chile, Nationalist China, Colombia, Denmark, Greece, Israel, Italy, Japan, Korea, Lebanon, the Netherlands, Pakistan, Peru, Philippines, Portugal, Spain, Sweden, Thailand, Turkey, Uruguay and Venezuela. President Eisenhower announced that to carry out these agreements the United States would make available 200 kg. (440 lb.) of enriched uranium instead of the 100 kg. which it had originally offered.

More extensive agreements were signed with Switzerland, Belgium, Canada and Great Britain. The agreement with Switzerland provided for the sale to that country of the research reactor which the United States subsequently exhibited at the International Conference on the Peaceful Uses of Atomic Energy. The price of the reactor was set at \$180,000. Agreements were also made to sell heavy water for use in research reactors to Italy, India, France and Australia.

The Belgian Agreement.—The United States and Great Britain had made an agreement with Belgium in 1944 for the purchase of uranium ore from the Belgian Congo and other Belgian territory. It stipulated that when the time came for the civil use of atomic energy Belgium should participate on equitable terms. As a consequence an agreement was made in 1955 under which the United States agreed to exchange information on power as well as research reactors and to sell to Belgium such amounts of enriched uranium as Belgium might need for an industrial power program.

Great Britain and Canada.—It will be recalled that British and Canadian scientists went to the United States during World War II and collaborated in the development of the first atomic bomb. This close co-operation was severely restricted when the U.S. congress passed the Atomic Energy Act of 1946. Both Brit-

ain and Canada, however, went forward with extensive atomic energy programs and Britain created and tested atomic bombs of its own.

Under the 1955 agreements the U.S. would exchange both classified and nonclassified information with Britain and Canada in the nonmilitary field. Provision was also made for the transfer of instruments and devices. The U.S. also agreed to sell to Canada such amounts of enriched uranium as it could without impairing its own program.

The Geneva Conference.—Seventy-two nations and several specialized agencies of the United Nations were represented at the first International Conference on the Peaceful Uses of Atomic Energy in Geneva, Switz., Aug. 8–20, 1955. Each nation was permitted five official delegates but an unlimited number of technical advisers, bringing the official attendance to 1,260. In addition about 800 unofficial observers and newspaper correspondents were present. The conference was under the auspices of the United Nations and sessions were held in the Palais des Nations, the original home of the old League of Nations and now the European headquarters of the United Nations.

Homi J. Bhabha, head of the Indian Atomic Energy commission, was president of the conference. Walter Whitman of Massachusetts Institute of Technology, Cambridge, Mass., was secretary general and Victor Vavilov of the U.S.S.R. was deputy secretary general.

The great significance of the conference lay in the fact that it lifted the "radioactive curtain" that had concealed the details of atomic research. A total of 1,071 scientific papers covering virtually every phase of the nonmilitary use of atomic energy were scheduled for publication in the proceedings of the conference, but time sufficed for the actual presentation of only half that number. A vast amount of scientific data, hitherto secret, was revealed, particularly in the papers presented by delegates of the United States, Great Britain, the U.S.S.R., France, Canada, the Netherlands and the Scandinavian countries.

The situation was summed up by Whitman, who stated that sufficient information had been revealed at Geneva to enable any nation with the requisite technical skill to build a nuclear reactor for the operation of an electric power plant.

Atomic World's Fair.—Between sessions of the Geneva conference, delegates and visitors thronged the halls of the Palais des Nations in which the first "atomic world's fair" had been set up, a series of exhibits and displays sent to Geneva by many of the nations taking part in the conference.

The United States had the largest display. Approximately 100 industrial firms and 50 academic and research institutions cooperated with the U.S. Atomic Energy commission in assembling it. It included models of all the reactors in the commission's five-year reactor program, a model of the Idaho chemical processing plant, actual reactor fuel elements and a wide variety of devices and instruments for the utilization of radioactive isotopes in scientific and medical research, industry and agriculture.

The U.S. was the only nation to exhibit an actual nuclear reactor. This was constructed at Oak Ridge, Tenn., and transported to Geneva by plane. It was housed in a special building erected on the grounds of the Palais des Nations.

The reactor was immersed in a pool of water 10 ft. in diameter and 21-ft. deep which served as a moderator, a coolant, and an effective shield against radiations. The core of the reactor consisted of 18 kg. of uranium enriched to 20% with Uranium 235.

The Soviet exhibits included a model of the 5,000-kw. power plant which the U.S.S.R. had in operation, models of several research and experimental reactors and a medical display.

Great Britain exhibited models of a number of power reactors.

MICROFEED CONTROL SYSTEM, a device containing a signal activated by beta particles introduced in 1955 for use in maintaining uniform quality in production of cigarettes

as well as of research types.

In addition to the exhibits in the Palais des Nations, an atomic "trade fair," not under conference auspices, was held in Geneva's downtown exhibition hall. British industrial firms had the largest exhibits in this fair.

Use of Hydrogen.—Although the subject of hydrogen fusion had been omitted from the agenda of the Geneva conference, Homi J. Bhabha of India, president of the conference, introduced it into his address at the opening session. He predicted that within 20 years a way would be found to control the basic reaction of the hydrogen bomb for the release of atomic energy for industrial purposes. He indicated that deuterium, the double-weight hydrogen occurring in heavy water, would be employed.

"When that happens," he said, "the energy problems of the world will truly have been solved forever, for the fuel will be as plentiful as the heavy hydrogen in the oceans." About one part in 5,000 of any given sample of water consists of heavy water.

At subsequent press conferences both Adm. Lewis L. Strauss, chairman of the U.S. Atomic Energy commission and head of the U.S. delegation, and Sir John Cockcroft, director of Britain's Atomic Energy Research establishment at Harwell, Eng., and head of the British delegation, disclosed that researches were under way in their respective organizations on the utilization of the hydrogen reaction for peaceful purposes. They indicated, however, that no "breakthrough" had yet occurred and that at present there was no known method of putting hydrogen fusion to work for the good of mankind.

Importance of Thorium.—A paper presented at the Geneva conference by John V. Dunwirth, head of the reactor physics group of the British Atomic Energy Research establishment, indicated that thorium might exceed uranium in importance as a source of atomic fuel. Thorium is believed to be from 4 to 10 times as abundant as uranium.

It had been known since 1940 that thorium, like uranium-238, will undergo fission with fast neutrons. However, as is the case with uranium-238, it will not sustain a chain reaction because of the high probability of neutron capture. But just as uranium-238 can be converted to plutonium in a nuclear reactor, so thorium can be converted into uranium-233, an isotope of uranium which will sustain a chain reaction.

Dunwirth indicated that thorium would be superior to natural uranium for the construction of a breeder reactor, that is, a reactor which would create more atomic fuel than it consumed while delivering heat to a power plant at the same time.

Until now, the chief use of thorium has been in the manufacture of gas mantles. About three-fourths of the thorium used in the world has come from the monazite sands of India. The next most important source is Brazil, but deposits occur also in North Carolina, South Carolina, Idaho and the Malay Archipelago.

New Reactor Designs.—The Geneva conference disclosed the rapid advances that had been made in the design of nuclear reactors, particularly the breeder type of reactor. Sir John Cockcroft described a breeder reactor that produced twice as much atomic fuel as it consumed. He pointed out, however, that the device was only an experimental one. It was the first fast neutron reactor to be built in Great Britain.

Atomic Fuel from Granite.—The world's reserves of uranium and thorium were greatly extended by the development of techniques for extracting the few parts per million of these atomic fuels which occur in ordinary granites everywhere in the crust of the earth. The new development was reported to the Geneva conference by Harrison Brown of the California Institute of Technology, Pasadena, Calif., who headed the team of scientists which carried on the researches.

Atomic Disarmament.—On Sept. 30, 1954, the U.S.S.R. proposed that the world make a new attempt to reach an agreement on atomic weapons and armaments in general. A month later the U.S.S.R. joined the U.S., Canada, Britain and France in sponsoring a resolution calling upon the United Nations Disarmament commission to revive its subcommittee which had met without success in 1953. The subcommittee consisted of representatives of the five nations sponsoring the resolution. It met in London in Feb. 1955 but suspended further deliberations after 12 weeks of meetings.

A new approach to the problem was proposed by President Eisenhower on July 21 at the Geneva conference of the heads of the Big Four Powers. He proposed that the United States and the Soviet Union exchange military blueprints and permit aerial inspection. The purpose of this would be to prevent the secret massing of weapons and planes that would be required for a surprise attack with atomic weapons.

The subcommittee of the United Nations Disarmament commission resumed negotiations on Aug. 29, 1955, with the Eisenhower proposal as one of the important items on its agenda.

Atomic Bomb Tests.—On Oct. 26, 1954, the U.S. Atomic Energy commission announced that the U.S.S.R. had been conducting a series of nuclear explosions since the middle of the previous month. The Soviet Union began another series of tests in Aug. 1955.

A series of 14 nuclear explosions were staged by the U.S. Atomic Energy commission at its Nevada test site between Feb. 18 and May 15, 1955. The tests were known as Operation "Teapot." Two detonations took place on March 29, the first time that two nuclear tests were ever staged on the same day. The tests were believed to include the prototype of an atomic warhead for an intercontinental guided missile, nicknamed a "city-buster."

In May 1955, the commission conducted Operation "Wigwam"

in the eastern Pacific ocean. The principal purpose of this test was to study the effects of a deep underwater nuclear explosion.

Great Britain announced on Sept. 12, 1955, that it intended to hold two series of atomic bomb tests in Australia in 1956.

Hydrogen Bomb Fall-Out.—In its first official report on the effects of a hydrogen bomb explosion, issued on Feb. 15, 1955, the U.S. Atomic Energy commission disclosed that the H-bomb exploded on March 1, 1954, contaminated a 7,000 sq.mi. area with a lethal radioactive fall-out. This is an area about one-seventh the size of New York state. The report stated further that the total amount of radiation received by residents of the United States as the result of all U.S., Soviet and British atomic bomb tests was "about the same as the exposure received from one chest X-ray."

Atomic Submarines.—The world's first atomic-powered ship, the U.S. submarine "Nautilus," put out to sea on Jan. 17, 1955. This marked the start of a series of exhaustive sea trials. Built over a period of three years, the "Nautilus" cost \$50,000,000.

A sister submarine, the "Sea Wolf," was launched on July 21, 1955, at the Electric Boat division of the General Dynamics corporation, Groton, Conn. The navy had two other atomic submarines scheduled for early construction.

Ford Atomic Prize.—Adm. Lewis L. Strauss announced at the Geneva conference on Aug. 8, 1955, that Henry Ford II and his brothers, Benson and William Clay Ford, had made a grant of \$1,000,000 to provide an annual award of \$75,000 and a medal to individuals or groups anywhere in the world, without regard to nationality or political belief, for contributions to the development of peaceful applications of atomic energy. The brothers explained that the award was being created as a memorial to their father, Edsel Ford, and their grandfather, Henry Ford.

Bohlen Visits Soviet Plant.—The Russian 5,000-kw. atomic power plant was described in detail at the Geneva conference by D. I. Blokhintsev. On Sept. 2, 1955, the U.S.S.R. invited U.S. Ambassador Charles E. Bohlen and the chiefs of 10 other foreign diplomatic missions to visit the plant. The visit took place on Sept. 6. They were told that the plant consumed 30 g. of uranium a day, the equivalent of 100 tons of coal in terms of thermal energy.

Whitfield Withdraws Name.—On March 16, 1955, President Eisenhower nominated Allen Whitfield, Des Moines, Ia., lawyer and Republican leader, to fill the vacancy on the U.S. Atomic Energy commission. Democratic congressmen almost immediately voiced their opposition to the appointment. On July 8, Whitfield requested President Eisenhower to withdraw his name.

Teller's Account.—On Feb. 25, 1955, Edward Teller of the University of California, Berkeley, published an account of the events leading up to the achievement of the hydrogen bomb in *Science*, official journal of the American Association for the Advancement of Science, under the title of "The Work of Many People." The article had obviously been written to destroy the myth that Teller had created the hydrogen bomb virtually singlehanded over the opposition of other atomic physicists. It named many scientists who took part in the development and was generous in its praise of J. Robert Oppenheimer, wartime head of the Los Alamos laboratory.

Atomic Power.—For the first time in history atomic energy was used to furnish all the electricity used by a small town. This occurred on July 17, 1955, when Arco, Ida., for an hour received all its electric power from an experimental atomic power plant at the National Reactor Testing station 20 mi. away.

Starting July 18, 1955, electricity generated by the nuclear reactor operated by the General Electric Co. at West Milton, N.Y., was fed into the transmission lines of the Niagara Mohawk Power corporation. The power company paid three mills

per kw.hr. for it. The reactor was the prototype for the submarine, the "Sea Wolf."

A number of private firms announced their intention of entering the atomic power field. The Consolidated Edison Co. of New York disclosed its intention of spending \$40,000,000 on the construction of a nuclear power plant. It planned to start construction in 1956.

Plans were also being made for atomic power plants by the Detroit Edison Co. and associates, by the Commonwealth Edison Co. of Chicago, by the Consumers of Public Power District of Columbus, Neb., and by several other groups.

Dixon-Yates Contract Cancelled.—President Eisenhower ordered the cancellation of the Dixon-Yates contract on July 1, 1955. The contract, originally negotiated by the U.S. Atomic Energy commission by the president's order, provided for a private utilities group headed by Edgar Dixon and Eugene Yates to build a plant to feed electricity into the Tennessee Valley authority system to replace power going to the atomic plant at Paducah, Ky. The contract was the subject of a long and bitter controversy in congress. (See also BUDGET, NATIONAL; PHYSICS; PUBLIC HEALTH ENGINEERING; URANIUM.)

Australia, Commonwealth of. Australia is a realm of the Commonwealth of Nations, situated in the southern hemisphere. Areas and populations of the federated states, Northern Territory and Australian Capital Territory are given in the table. Apart from

State or territory	Capital (with pop. June 30, 1954, census, prelim.)	Area (in sq.mi.)	Population	
			(1947 census)	1954, census, prelim.
New South Wales	Sydney (1,863,217)	309,433	2,984,838	3,423
Victoria	Melbourne (1,524,062)	87,884	2,054,701	2,452
Queensland	Brisbane (502,353)	670,500	1,106,415	1,318
South Australia	Adelaide (484,535)	380,070	646,073	797
Western Australia	Perth (348,596*)	975,920	502,480	639
Tasmania	Hobart (95,223)	26,215	257,078	308
Northern Territory	Darwin (1,566†)	523,620	10,868	16
Australian Capital Territory	Canberra (28,277)	939‡	16,905	30
Totals		2,974,581	7,579,358	8,986

*Including Fremantle. †1947 census. ‡Including 28 sq.mi. at Jervis Bay (federal port, 90 mi. E.N.E. of Canberra). §Excluding aborigines: full-blooded (1947) 46, half-caste 271,179.

larger state capitals there was only one city with population more than 100,000 in 1954: Newcastle, N.S.W., 178,086. Territories under the administration of the commonwealth of Australia but not included in it comprise Papua and the trust territory of New Guinea (see PAPUA-NEW GUINEA), Norfolk Island (13 sq.mi.; population, 1954 census, 942), the island territory of Nauru (8 sq.mi.; population, 1954 census, 3,400), Ashmore and Cartier islands, Heard and Macdonald islands (159 sq.mi.), Cocos (Keeling) Islands (5 sq.mi.; pop., 1954 est., 624) and the Australian antarctic territory (2,472 sq.mi.). Language: English. Religion (1947 census): Anglican 2,957,032; Roman Catholic (including Greek rite) 1,586,000; Methodist 871,425; Presbyterian 743,540; Baptist 113,000; Church of Christ 71,771; Lutheran 66,891; Congregational 243; other Christian 198,769; Jewish 32,019; other non-Christian 4,543; indefinite and no religion 45,036; no reply 824. Queen, Elizabeth II; governor general in 1955, Field Marshal Sir William Slim; prime minister, Robert Gordon Menzies.

History.—Politically, 1955 was marked by the sudden e

ence of long-developing schism within the Labour party. Labour formed the opposition in the federal parliament, but at the beginning of the year occupied the treasury benches in five of the six state legislatures. After the parliamentary leader of the Labour party, Herbert Evatt, appeared as a barrister before the royal commission on espionage and defended various communists and communist sympathizers, the political wing of Catholic Action launched a campaign against Evatt both within and outside the party. Evatt, with the support of Catholic members of the Labour party who did not endorse the political deals and practices of Catholic Action, retaliated by having the party proscribe the "A. L. P. industrial groups," anticommunist activist squads within the trade unions, organized and directed by Catholic Action. Evatt claimed the groups were saboteurs that sought to capture the party. Six Catholic federal Labour members and one Protestant left the Labour party and formed a "corner" party which they styled the Australian Labour party (Anti-Communist).

At the same time, supporters of Catholic Action's political wing defected from the state Labour government in Victoria and thus precipitated a state election. Labour lost the election. But every Catholic Action Labour defector lost his seat, although most were men of high standing in "safe" seats—a state which generally was interpreted as evidence that the Australian electorate would never support splinter parties. Labour seemed vulnerable to disrupters from both left and right through its lack of a firm political platform; most of its harder objectives had been attained long before.

With all the superficial signs of boom the Australian economy for the second year in succession was in near equilibrium, after years of inflation which reached a climax in 1951. But the federal treasurer, Sir Arthur Fadden, warned of a persistent tendency for Australia to spend, especially abroad, more than it earned. Twice in the year the government decreed import cuts of increasing severity in an attempt to curb the drain on overseas funds.

With a declared objective of discouraging private spending, the budget, presented in August, contained no tax concessions. Further to discourage spending, the government asked the banks to restrict advances, especially advances to hire-purchase finance companies and for the financing of imports. From June 1953 to June 1956, credit issued by hire-purchase firms to the public had increased fourfold.

In June 1955 the federal parliament exercised for the first time its constitutional power to send to jail a citizen for breach of parliamentary privilege. By a vote of 55 to 12 (not in party lines), the house of representatives sent two men to jail for three months. Each was called separately to the bar of the house, and each confessed to publishing in a suburban newspaper articles "intended to influence and intimidate a member of parliament."

After 126 days' hearings, most of them in public, the royal commission on espionage ended. The commission was established to investigate allegations made by Vladimir Petrov, former third secretary at the Soviet embassy in Canberra, and his wife Evdokia, both of whom defected in April 1954. The report found that several Australian citizens both for profit and from political sympathy had aided the Soviet intelligence organizations; but none had committed an offense under existing law. The commission found that since the establishment of an Australian counterespionage organization in 1948-49, Soviet political espionage in Australia had been negligible. Knowledge of the alertness of Australian counterespionage had inhibited and frustrated successive Soviet agents, including Petrov. Petrov and his wife were unable to inform the commission on military espionage. They reported that they did not know who,

if anybody, within the embassy controlled it. Diplomatic relations with Australia, which the Soviet government "suspended" after the "Petrov provocation," remained suspended. But the day the royal commission report was tabled in the house of representatives, the U.S.S.R. for the first time since 1945 admitted Australian newspaper correspondents. This was five months after the general easing of restrictions on British and U.S. correspondents.

Natural increase (with a birth rate of 23 per 1,000) accounted for 55% of the population growth of 1,407,515 between the 1947 and 1954 censuses, and immigration for 45%. Australia's population was estimated to have reached 9,000,000 by late 1955.

In October the country received its 1,000,000th assisted migrant since World War II; she was an English girl. Of the 1,000,000 migrants, 49% came from the United Kingdom, 11% from Italy, 7% from the Netherlands and 7% from Poland. In the year ended in June 1955, Australia received 124,000 assisted migrants, 9,000 in excess of the target; the target intake for 1955-56 was 125,000. Of current intake, 49% were British, 16% Italians, 10% Germans and 9% Greeks (prosperity in the Netherlands and strong competition from Canada and New Zealand stemmed the flow of the non-British migrants most favoured by the government—the Dutch).

In October, for the first time in peace, Australia sent troops (all regulars) beyond Australian territory. A battalion was sent to Malaya; government statements did not make it clear whether they would join in the war against the Malayan communists or whether they were solely to help guard Malaya from external aggression. Since 1949 Australia had made a comparable token contribution to R.A.F. bomber strength in Malaya.

During 1955 secondary industry gained potential through the opening of a major new steel strip mill, a publicly owned aluminum production plant and two new oil refineries. There was in 1955 no workable production of oil.

In publishing, biographies and histories predominated in the serious field. There was a full-length biography by Patricia McCaughey of *Samuel M. McCaughey*, pioneer pastoralist; one of *John Macarthur*, pioneer sheepbreeder, by M. H. Ellis; and *Wainwright in Tasmania*, by Robert Crossland, a biography of a gifted convict whose character has long been disputed. *Select Documents in Australian History 1851-1900* was the second volume of C. M. Clark's collection. *Australia: A Social and Political History*, edited by G. Greenwood, was a symposium by six university history teachers. (R. J. GE.)

Education.—Schools (1952): government (including primary, secondary, junior technical) 7,620, pupils 1,087,990, teachers 38,407; private (all types) 1,926, pupils 347,831, teachers 13,714; vocational (1951) 146, students 159,310, teachers 6,784. Teachers' training colleges 15. Universities (1954): 10, students (full-time only) 16,976.

Finance and Banking.—Monetary unit: Australian pound, with an exchange rate of £A1.25 = £1 sterling, and £A0.45 = U.S. \$1. Budget: (1954-55 actual) revenue £A1,059,000,000, expenditure £A989,000,000; (1955-56 est.) revenue £A1,114,700,000, expenditure £A1,066,100,000 (excluding special appropriation of £A48,500,000 for commitments outside normal budget). Total public debt: (June 1954) £A3,606,800,000, of which £A351,200,000 to U.K.; (June 1955) £A3,749,400,000. Currency circulation: (Oct. 1954) £A353,000,000; (June 1954) £A345,000,000. Bank deposits: (Nov. 1954) £A1,231,000,000; (June 1954) £A1,241,000,000. Gold and foreign exchange holdings: (Sept. 1954) U.S. \$1,131,000,000; (Dec. 1954) \$1,133,000,000.

Foreign Trade.—(1954) Imports £A752,700,000, exports £A741,900,000. Main sources of imports: U.K. 47%; other sterling area 15%; U.S. and Canada 14%; France and other continental European Payments union countries 14%. Main destinations of exports: U.K. 37%; other sterling area 17%; France 8%; other continental E.P.U. 16%; U.S. and Canada 8%. Main exports: wool 48%; wheat 7%; butter 3%.

Transport and Communications.—Roads (1954): 813,500 km. Licensed motor vehicles (June 1954): cars 1,199,833, commercial vehicles 606,899. Railways (1954): 43,780 km.; freight, 10,092,000,000 ton-km. Shipping (July 1954): merchant vessels of 100 gross tons and over 384; total tonnage 594,129. Air transport (1953): kilometres flown 80,840,000; passenger-kilometres 1,484,710,000; freight, 54,725,000 ton-km.

Telephones (June 1954): 1,475,513. Licensed radio sets (1953): 1,968,000.

Agriculture.—Main crops (metric tons, 1954): wheat 4,534,000; oats 490,000; barley 588,000; maize 110,000; potatoes 457,000; sugar (raw value, 1954) 1,343,000. Livestock (Sept. 1954): sheep 126,890,000; cattle 15,589,000; horses 825,000; pigs 1,185,000. Wool production (metric tons, clean basis, 1954): 323,000. Dairy production (metric tons, 1954): milk 6,012,000; butter 180,000; cheese 49,200. Meat production (metric tons, 1954): beef and veal 734,400; pork 92,400; mutton and lamb 387,600.

Industry.—(1954) Fuel and power: coal (metric tons) 20,058,000; lignite 9,480,000; manufactured gas 1,224,300,000 cu.m.; electricity 14,465,000,000 kw.hr. Raw materials (metric tons): pig iron 1,889,000; crude steel 2,257,000; copper (smelter) 39,430; refined lead 242,900; zinc (smelter) 106,300; tin concentrates (1953. Sn content) 1,500; gold (1954) 1,116,100 fine oz. Manufactured goods (metric tons, 1954): wool yarn 20,110; cement 1,913,800. New dwelling units completed (1954): 77,086.

Austria. A republic of central Europe, Austria is bounded north by Germany and Czechoslovakia, east by Hungary, south by Yugoslavia and Italy and west by Switzerland. Area: 32,374 sq.mi. Pop.: (1951 census) 6,933,905; (1954 est.) 6,969,000. Language: German 98%, other 2% (mainly Slovene in Carinthia). Religion (1939): Roman Catholic 88.27%, Protestant 5.35%, Jewish 1.26% (0.2% in 1945), other 5.12%. Principal towns (pop., 1951 census): Vienna (cap.) 1,766,102; Graz 226,453; Linz 184,685; Salzburg 102,927; Innsbruck 95,055; Klagenfurt 62,782. President in 1955, Theodor Körner; chancellor, Julius Raab.

History.—In a speech to the supreme soviet on Feb. 8, 1955, V. M. Molotov, Soviet minister for foreign affairs, declared that the delay in concluding the Austrian state treaty was unjustified but that guarantees must be found against another *Anschluss* and against Austria's participation in any coalition before the treaty could be signed. While amplifying these remarks to the Austrian ambassador in Moscow, Molotov brought to the fore the dramatic reversal of the Soviet policy towards Austria—agreement between the powers about Germany was no longer regarded by the Soviet government as an indispensable prerequisite to the conclusion of the Austrian treaty. On March 24 Raab was invited to visit Moscow. This invitation was accepted and on April 11 an Austrian delegation consisting of Raab; Leopold Figl, the foreign minister; Adolf Schaerf, the vice-chancellor; and Bruno Kreisky, a secretary of state, flew to Moscow. The communique issued April 15 disclosed results which in view of previous Soviet intransigence surpassed the wildest hopes. The Russians were not only prepared for a speedy conclusion of the treaty and evacuation of Austria by all foreign troops by the end of the year; they would also release all Austrian prisoners of war and civilian internees held in the U.S.S.R. and they were prepared to grant substantial improvements in the economic clauses of the treaty.

The three western powers, on being invited by the U.S.S.R. to a conference of foreign ministers to be held in Vienna, counterproposed a preparatory meeting of ambassadors. This took place and after some initial difficulties the treaty was ready for signature by the foreign ministers. On May 14 the foreign ministers arrived in Vienna and the following day the treaty was signed at the Belvedere palace.

Throughout Austria the signing of the treaty was received with great enthusiasm. There was music and dancing in the streets, buildings were bedecked with flags and all church bells were rung for 15 minutes. Immediately after the signing ceremony the foreign ministers appeared on the balcony of the Belvedere and were acclaimed by the vast crowd below. They then drove through the crowded streets to a luncheon given by the president of the republic at the *Hofburg* and in the evening as guests of the government they attended a great banquet at Schönbrunn palace.

The state treaty proper together with two other instruments, the declaration of neutrality and the Austro-Soviet agreement

concluded in Moscow, thenceforward regulated Austria's status in the postwar era. The state treaty provided for the establishment of a sovereign and democratic Austria within the frontiers of 1938. The *Anschluss* was forbidden and rights of non-German minorities were guaranteed. Austria was allowed to keep an armory of whatever size it wished, but atomic and other special weapons were forbidden. There were no reparations but Austria had to buy back from the U.S.S.R. the former German properties which had been under Soviet control and pay for them \$150,000,000 (their value was estimated to be only \$40,000,000, but was in the old draft treaty this sum had to be paid in currency to the U.S.S.R. now accepted payment in goods instead). A further sum of \$2,000,000 was to be paid by Austria for the unconditional return of the assets of the Danube Shipping Company. The oil fields of eastern Austria, including refineries and the distributing company with its numerous filling stations, were to revert to Austria against deliveries of 10,000,000 tons of crude oil to the U.S.S.R. for a period of ten years.

The neutrality declaration, which came into force on Nov. 30, 1955, became an integral part of the constitution and approximated the position of Austria to that of Switzerland. It contained the following passages: "With the object of the lasting and perpetual maintenance of its independence . . . Austria declares that it will on its own free will its perpetual neutrality and will maintain and defend it with all the means at its disposal; Austria will never join a military alliance or allow the establishment of military bases of foreign states on its territory." It was further emphasized that Austria's neutrality was compatible with membership in the United Nations.

The withdrawal of occupation troops was completed by October 25, 1955, and the responsibility for setting up an army now devolved upon the Austrian government. Conscription was introduced by the Armed Forces act of Sept. 7 and fixed for a period of 18 months. Existing gendarmerie and frontier guards provided the nucleus of the new army.

Difficult problems were raised by the return of the former German and then Soviet properties into Austrian hands. Immediately after the signing of the treaty the German Federal government vigorously protested against a clause contained therein which prohibited the return to German ownership of any assets worth more than \$10,000. This clause was aimed at preventing German economic penetration of Austria. Raab pointed out to the Germans that these assets had been handed over by the Potsdam agreement to the U.S.S.R. which had then sold them to the Austrians on condition that they were not to go back to the Germans.

In terms of the proportion of their share capital the Soviet properties represented 100% of the oil industry, 59% of the leather goods industry, 40% of iron and other metal goods, 30% of machine and machine-tool production and 17% of machine industry. Some of the firms concerned were to be nationalized under the Nationalization act of 1946; others were to revert to their pre-German owners, while the future of yet another group was uncertain. Many of the factories required considerable investments to make them competitive in a free market and their requirements would compete with those of the other Austrian industries. On the other hand, it was estimated that these undertakings had, while under Soviet control, handled annually \$20,000,000 as profits abroad.

The integration of the Soviet properties into the Austrian economy must be seen in a context of continuing economic expansion with inflationary tendencies already apparent. At the end of June the number of those registered as seeking work was 76,572, representing a decrease of 36% over the same figure of the previous year. But a shortage of certain types of skilled labor

FLAG-WAVING CROWD in Vienna, May 15, 1955, as treaty granting Austrian independence was signed at Belvedere palace

was already noticeable. Liberalization of foreign trade continued apace, the percentage of goods that could be imported from O.E.E.C. (Organization for European Economic Cooperation) countries without license being brought up to 90%. Signs of prosperity such as the ever-increasing figures for the registration of new cars were not wanting and some anxiety regarding the balance of payments position was being felt in the latter part of the year.

An important question raised by the ending of the period of foreign occupation was that of the continuance of the government coalition between the Christian Democrats and the Social Democrats. It was felt in some quarters that little good would come of Austria's regained liberty if it presaged a return to the conditions of internal political warfare which had marked the first republic. Fortunately there were no signs of a major crisis. Local elections in Styria and Lower Austria showed a further strengthening of the two coalition parties at the expense of the communists and the neo-Nazi group (*Verband der Unabhängigen*).

It was a happy coincidence that the Austrian liberation was completed at the same time as the rebuilding of the two great theatres which formed its particular glory, the Vienna Burgtheater and the Vienna state opera. The former was opened with *König Ottokars Glück und Ende*, a patriotic piece by Grillparzer eulogizing Austria's historic mission. The opening performance on Nov. 5 in the new opera house—claimed to be the most modern in the world—was turned into a national festival. Composers, singers and opera directors from all over the world, as well as the leading personalities of industry and politics, filled the audience. Beethoven's *Fidelio* was performed and it was hoped that this paean on freedom with its final triumphant chorus would in some way echo the feelings and aspirations of a new free nation.

(V. T. E.)

Education.—Schools (1953): primary 5,202, pupils 813,310, teachers 35,935; secondary 171, pupils 73,020; vocational (postprimary) 527, pupils 122,498; teachers' training colleges 51, students 4,648. Institutions of higher education (1953) 14, students 20,011, teachers 3,041.

Finance and Banking.—Monetary unit: *schilling*, with an exchange rate of 72.58–73.02 to the pound sterling and 26.08 to the U.S. dollar. Budget (1954; 1955 est. in parentheses): revenue 20,016,500,000 schillings (18,408,800,000 schillings); expenditure 20,770,700,000 schillings (19,657,300,000 schillings). Internal debt (1954) 11,618,300,000 schillings; external debt 2,052,300,000 schillings. Gold and foreign exchange holdings (Mar. 1955) U.S. \$359,000,000. Currency circulation (Dec. 1954; Feb. 1955 in parentheses): 11,980,000,000 schillings (11,730,000,000 schillings). Bank deposits (Dec. 1954; Feb. 1955 in parentheses): 16,-

440,000,000 schillings (16,720,000,000 schillings).

Foreign Trade.—(1954) Imports 16,988,000,000 schillings; exports 15,852,000,000 schillings. Main destination of exports: Germany 24%; Italy 17%; other continental European Payments Union countries 20%; U.S. and Canada 5%; Latin America 4%; U.K. 4%. Main sources of imports: Germany 36%; Italy 8%; other continental E.P.U. 18%; U.S. and Canada 10%; U.K. 5%; Latin America 4%.

Transport and Communications.—Roads (1953): 28,500 km. Motor vehicles in use (1953): cars 74,500; commercial vehicles 52,200; Federal railways (1954): 6,026 km.; passenger-km. (1953) 5,032,000; freight, ton-km. 5,213,000. Telephones (Jan. 1954): 458,006. Licensed radio receiving sets (1953): 1,629,000.

Agriculture.—Main crops (metric tons, 1954): wheat 451,000; barley 313,000; oats 334,000; rye 369,000; maize 134,000; beet sugar (raw) 211,000; potatoes (1953) 3,293,000; grapes for wine (1953) 89,000. Livestock (Sept. 1954): cattle 2,300,000; sheep 297,000; pigs 2,643,000; horses 259,000; mules and asses 2,000; goats (1953) 311,000; poultry (Sept. 1953) 8,000,000.

Industry.—Fuel and power (1954): coal 173,300 metric tons; lignite 6,284,000; electricity 7,703,000,000 kw.hr.; manufactured gas 328,900,000 cu.m.; crude petroleum (1953) 3,000,000 metric tons. Raw materials (metric tons, 1954): iron ore, 30% metal content, 2,722,000; pig iron 1,355,700; crude steel 1,653,000; aluminum 57,200; copper (electrolytic) 8,300; magnesite (1953) 812,800; timber (1953) 9,900,000 cu.m. Manufactured goods (metric tons, 1954): woven cotton fabrics 13,800; cotton yarn 21,200; wool yarn 10,900; rayon staple fibre 36,800; cement 1,617,800; paper, including newsprint (1953) 298,000; nitrogenous fertilizers (N content, 1953–54) 107,800.

Autobiography: see AMERICAN LITERATURE; etc.

Automobile Accidents: see ACCIDENTS.

Automobile Industry. The most eventful year in recent automobile industry history, 1955 saw cars produced in the United States faster than ever before. From the beginning of the year, manufacturers turned out vehicles at a higher rate than they had in 1954. Almost monthly, too, more cars were produced than in the same month of 1950, previous top production year.

Not until the end of August, when a number of large producers shut down for changing over to the 1956 models, did a week's output drop below that of the corresponding week of the preceding year. By that time, 1955 car production had passed the entire 12-month 1954 total, previously third in all-time production. September, the height of change-over time, saw output drop to its slowest pace of the year, but by the end of the month the passenger car total was pushing the 6,000,000 mark and approaching the runner-up year of 1953. As the car makers swung into full production of their 1956 lines in October, it appeared certain that the record total of 6,665,863 achieved in 1950 would be eclipsed early in November and that the 1955 final figure would approach or exceed 8,000,000.

INTERNATIONAL AUTOMOBILE EXHIBITION at Frankfurt, Ger., in Sept. 1955. Shown in the foreground are three products of General Motors corp., U.S. Left to right: Pontiac hardtop, Cadillac "El Dorado" sports convertible, Chevrolet hardtop

"TINKERS TO EVERS TO CHANCE," a comment on the proposed guaranteed annual wage for auto workers by Green of the *Providence (R.I.) Journal* in 1955

Trucks and buses, while not built at a record-breaking pace, nevertheless ran ahead of the 1954 performance. An anticipated volume of 1,250,000 commercial vehicles was expected to put the grand total of U.S. vehicle production for the year over 9,000,000. More than 150,000,000 vehicles had been produced by the industry in its 56-year recorded history, about 62,000,000 of which were still in service at the end of 1955.

The record-smashing production and sales were achieved only by dint of aggressive selling efforts by manufacturers and dealers throughout the country. In view of the high production in 1953 and 1954, it was felt in some quarters that the saturation point of the new car market was being approached. Particularly in late summer and early fall was this opinion manifested, when automobile dealers offered large discounts in price and extremely liberal credit terms in the "clean-up" of 1955 stock before the appearance of the 1956 models.

In volume of production and sales, practically every manufacturer improved significantly on his 1954 performance, but there was some adjustment of the different companies' "shares" of the market, percentage-wise. Again the big three—General Motors corporation, Ford Motor company and Chrysler corporation—divided between 94% and 95% of the passenger car sales.

Foreign cars, led by the German Volkswagen, made an appreciable gain in the United States market in 1955. Increasing their sales by more than 80% over 1954, the import cars accounted for 0.62% of the United States total, as compared with 0.48% a year earlier. Almost half the foreign cars sold in the country were Volkswagens.

Employment.—The year was marked by negotiation of new labour contracts between all major automobile companies and the United Automobile Workers of America. The previous contracts of General Motors and Ford expired almost simultaneously in the spring. Seeking a guaranteed annual wage for its members, the union did not reach that objective, but was able to win a provision in the new contracts for payments to supplement state unemployment compensation during periods of idleness. In both cases the supplemental payments were to bring unemployment income up to 60% to 65% of regular wages. Both General Motors and Ford reached agreement with the U.A.W. very shortly after expiration of the old contracts, and were able to avoid strikes of any great consequence. Both companies made concessions amounting to wage increases of about 20 cents an hour, counting the unemployment pay, annual improvement factor, pension plan increase and other benefits.

Payments by these companies into the unemployment fund began in June. Workers would become eligible for supplemental unemployment payments June 1, 1956. Chrysler, third member of the big three, reached a contract similar to the General Motors and Ford pacts on Sept. 1. However, the American Motors corporation (Nash and Hudson) agreement, signed about the same time, provided for postponement of payment to the company into the supplemental unemployment compensation fund until Sept. 15, 1956, with payments to workers not to begin until a year later. The other manufacturers (Studebaker-Packard corporation and Willys Motors, Inc.) still were involved in negotiations at the middle of October, but it seemed likely that Studebaker-Packard, at least, would agree to a supplemental unemployment pay supplement.

With production going at a fast pace throughout practically the entire year, average employment in the industry was about 910,000, including more than 700,000 production workers. Both figures were among the highest in history.

Engineering.—Continuing increases in horsepower, severe new V-8 engines, and the passing of the straight eight were prominent engineering events of 1955. Chevrolet, biggest producer and seller in the auto industry for many years with six, came out with its first 8-cylinder engine, a 162-h.p. V-8, and Plymouth, the Chrysler corporation entry among the popular "low priced" cars, joined Ford and Chevrolet in the V-8 class with two V-8's, of 157 and 167 h.p. Ford, in turn, raised its V-8 to 162 h.p., or 182 h.p. with power pack. All three offered power packs for 10 to 20 additional horsepower.

The power pack, usually consisting of a 4-barrel carburetor, a modified intake manifold and a dual exhaust system, was offered by practically every manufacturer and proved to be very popular.

ONTINENTAL MARK II, introduced by the Ford Motor company in Oct. 1955. Similar to its predecessor, the Lincoln Continental, out of production since 1948, the Mark II was about 18 ft. long and 4 ft. 8 in. high, lowest of all U.S. mass-produced cars

more popular than the companies had hoped. So great was the demand for the engines with the additional power that dealers found it impossible to fill all their power pack orders.

Larger, more powerful cars met public demand for improved power and performance by offering optional engines which provided as much as 300 h.p.

Average compression ratio of all U.S. makes went up from 6.64 to 7.96, with two cars boasting the high ratio of 9.0:1. The highest in 1954 had been 8.7. In 1954 the lowest compression ratio in the industry was 6.8, but in 1955 none was below 7.20. The average 1955 American car could deliver up to 173.1 brake h.p., a rise of 22.3 over 1954. Engine displacement went up only .6 in. to 270.7 while speed at maximum horsepower rose 264 p.m. to 4,279. Average car weight for engine power went down from 24.88 to 22.05 lb. per horsepower.

One new development that might be the harbinger of another trend appeared in 1955. This was the torsion bar suspension introduced by Packard. The new suspension, which eliminates the springs used in the conventional type, is designed to smooth out and level the ride, regardless of roughness of the road. Small electrically-driven hydraulic pumps are incorporated into the suspension to level the car laterally as well as longitudinally.

The automatic transmissions continued their rapid rise in

popularity, 69% of the new cars sold during the year being equipped with this feature. Total sales of the "automatics" increased from 3,200,000 in 1954 to about 5,500,000 in 1955.

Newer conveniences such as power brakes and power steering likewise were in greater demand than in 1954. During 1955, about 24% of new car purchasers asked for power brakes and 25% requested power steering. These were up from 18% and 19% respectively a year earlier.

Air conditioning, relative newcomer in the field of added conveniences to the motorist, showed a sharp increase in demand. More than 175,000 of the units were installed in new cars purchased during the year, more than triple the 1954 sales of automobile air conditioning. Less spectacular but still significant was the rise in sales of power-adjusted seats and powered window lifts, both of which passed the 500,000 mark for the first time.

Tubeless tires became standard throughout the industry in 1955, and 12-v. electrical systems were incorporated in all makes of one large manufacturer.

The tremendous upsurge in customer demand for power assists continued a trend that had been evident since the end of World War II. The automatic transmission, first in the parade of recent developments designed to lighten the driver's work, made its first appearance in the late 1930s. As late as 1949, only one new car out of four was an "automatic," but by 1954 the proportion had risen to 58%, and the 69% for 1955 indicated

that predictions of 100% automatic transmissions in the future might not be far wrong.

Even the Chevrolet-Ford-Plymouth group installed automatic transmissions in more than half of their output. Average for the rest of the industry was close to 90%.

The trend toward more luxury in motor cars is illustrated also by the shift to 8-cyl. engines. Only 32% of new car sales in 1940 were eights. In 1947 the proportion had risen only to 35.7%. The postwar swing to more powerful cars is reflected by increase to 61% eights in 1954 sales, and in 1955, with Chevrolet and Ply-

ITALIAN FIAT SPORTS CAR displayed at 1955 automobile show at Torino, It., in 1955. The cars of 67 manufacturers were shown

mouth in the 8-cyl. field for the first time, 75% of all new cars sold boasted eight cylinders.

A shift in the market pattern during 1955 was further illustrative of the public's desire for more of everything in its cars. The popular low-priced three—Chevrolet, Ford and Plymouth—obtained a smaller share of the market than a year earlier. Combined sales of the three makes were 57.5% of the U.S. total in 1954. Despite the fact that they all sold more cars in 1955, their percentage of the market declined to about 52. This change was evident in all sections of the country.

New emphasis was placed on safety features by the automobile industry in 1955. Some makes of cars offered safety seat belts as optional equipment, and several had padded instrument panels to minimize the likelihood of injury in collisions. Safety research during the year gave promise that new features would be forthcoming to protect driver and passengers. Practically every manufacturer worked on development of a safety door latch that would not open from the impact of a collision. At least one make had safety latches as standard equipment beginning in June.

Styling.—The vast majority of all cars produced in the United States during the year had more than one colour. Some makes offered optional three-tone paint, and others, while confined to two colours, were divided into three-colour areas. The choice of colours was expanded, also, with many colours appearing that previously had never been seen on automobiles.

The popularity of the hardtop, or sport coupé, increased tremendously during the year, this style taking second place in sales behind the four-door sedan. Two cars offered a four-door hardtop for the first time, and the new body style won wide and eager public acceptance from the start.

The hardtop had as its principal structural feature elimination of the centre post extending to the top of the car. Unlike the "soft-top" convertible, it had a steel roof, but still gave the feeling of openness characteristic of the convertible. Before 1955, no manufacturer had ventured to suspend doors from the centre post, secured only at the lower end.

Tinted heat-absorbing glass likewise gained in popularity during 1955. A year earlier, slightly more than 2,000,000 buyers asked for the special glass. The total was well over 3,000,000 in 1955. (See also MOTOR TRANSPORTATION.) (C. F. KE.)

Automobile Insurance: see INSURANCE.

Automobile Racing.

A series of accidents resulting in a heavy toll among drivers and spectators alike threatened to bring the sport to a complete

stop in 1955. Included among the casualties was the American champion, Bill Vukovich, who was seeking his third straight victory in the Indianapolis (Ind.) 500-mi. classic on May 3. Leading the field after 140 mi., Vukovich ran into a four-car tangle of wreckage on the backstretch. Vukovich's death was the second attributed to the 1955 race, for Manuel Ayulo of Buena Park, Calif., had died on May 17 after crashing into a retaining wall during a practice run the day before.

Alberto Ascari, Italian ace and only pilot ever to capture the world championship two consecutive years (1952–53), was killed on May 26 while testing a borrowed car at Monza, It. Among the many other drivers killed during the year were such stars as Armando Francois, Italy; Mario Alborghetti, Italy; Mike Keen, Great Britain; Charley Miller, United States; Jerry Hoyt, United States; Piero Valenzano, Italy; and Jack McGrath, United States.

The worst accident in the sport's history took place at Le Mans, Fr., on June 11 when a Mercedes crashed into another racer, burst into flames and catapulted over a retaining wall into the crowd. The toll from flaming gasoline and flying debris was 82 dead, including the driver of the Mercedes, Pierre Levegh of France. Mike Hawthorne of Britain went on to win the 24-hr. sports car grind in a Jaguar. On June 13, the French government banned all racing until safety rules to prevent repetition of such a tragedy could be drawn up. On July 1, Italy barred all open road racing for the balance of 1955 after a temporary suspension had been put into effect on June 1. The American Automobile association announced (Aug. 3) that it would sever all connections with the sport after 1955.

Averaging 128.209 m.p.h. in a John Zink Special and driving without relief, Bob Sweikert of Indianapolis took top honor in the 1955 Indianapolis 500-mi. race. His total elapsed clocking was 3 hr. 53 min. 59.53 sec. Sweikert won \$76,138 in prize money. An all-time record total of \$270,050 was distributed for the blue-ribbon event of American racing. Tony Bettenhausen, Terre Haute, Ind., who was relieved by Paul Russo, drove a Chaparral Special to second place. Jimmy Davies, Pacoima, Calif., was third in a Bardahl and John Thomson, Springfield, Mass., was fourth in a Schmidt Special. Walter Faulkner, Long Beach, Calif., piloting a Merz Special, was fifth among the 14 drivers to finish. Sweikert proved one of the year's top scorers. Driving his Zink Special he won the 100-mi. race at the New York State fair (Syracuse) in 1 hr. 6 min. 43 sec. It marked his second straight triumph in the event. Among his many other victories was that at the Heidelberg raceway in Pittsburgh, Pa., on Aug. 14, when he drove to three track records.

Two world standards for stock cars went by the boards on Aug. 27 at St. Paul, Minn. Jerry Draper, East Moline, Ill., set a mark of 5 min. 10.88 sec. in the first heat of 10 laps (5 miles). Then Ernie Derr, Keokuk, Ia., improved that time in the second heat when he was caught in 5 min. 03.58 sec. Bob Hilmer, Dysart, Ia., set a new time of 6 min. 15.93 sec. in the consolation race of six miles. The records are International Congress of Automobiles association marks. Tim Flock, Atlanta, Ga., Jimmy Bryant, Phoenix, Ariz., Tommy Hinnershitz, Reading, Pa., John Thomson, Springfield, Mass., Jimmy Romaine, Youngstown, Pa., Frank Mundy, Atlanta, and Carroll Shelby, Inglewood, Calif., were other drivers consistently among the leaders in 1955 racing.

Major Speed Records.—The usual number of trials at Bonneville Salt Flats in Utah were missing. However, a Dodge stock car, selected at random from an assembly line, passed the 15,000-mi. mark for a marathon run and broke two world unlimited records that had stood since 1937. The car averaged 102.80 m.p.h. for 15,000 mi. and 102.92 m.p.h. for six days. Previous standards were 87.91 m.p.h. and 88.33 m.p.h.

Pan-American Road Race.—Umberto Maglioli won

SPECTATORS RUNNING from burning racer at Le Mans, Fr., just after the car crashed June 11, 1955, during the annual Le Mans endurance race. Eighty-two persons were killed in the worst motor racing disaster in history.

18,000 top prize in the 1954 race from Tuxtla Gutierrez to Cuernavaca in Mexico that ended Nov. 23, 1954. The Italian speedster pushed his Ferrari to a record elapsed time of 17 hr. 40 min. 26 sec. to better the mark of 18 hr. 11 min. for unlimited sports cars set in 1953. Ray Crawford, Pasadena, Calif., won with a Lincoln among U.S. big stock cars and Tommy Drisdale, El Paso, Tex., drove a Dodge home first in the smaller group. Gonzalvo Sanesi, Italy, in an Alfa Romeo, won in the European stock car class and Hans Hermann, Germany, drove a Porsche to victory in the European small sport car division. The tortuous grind cost the lives of five competitors and several spectators. The Mexican government suspended the 1955 event, barring all racing from federal highways until ample assurance of safety for spectators could be given.

Major Grand Prix Races, 1955.—Following is a résumé of the leading events:

British (Aintree)—Sterling Moss, England's top driver, defeated his Mercedes-Benz teammate and world champion, Juan Manuel Fangio of Argentina, by a half length. Moss was the first Briton to win since this race was started in 1948.

Belgian (Francorchamps)—Fangio led all the way to take the 315-mi. test, with Moss second.

Swedish (Kristianstad)—The Mercedes-Benz continued its domination of the world racing scene as Fangio won, with Moss 10 yd. behind at the finish.

Dutch (Zandvoort-on-Sea)—Fangio beat Moss, with Italy's Luigi Musso, in a Maserati, third.

European (Monte Carlo)—Maurice Trintignant, France, in a Ferrari, won with a record average of 65.66 m.p.h. Fangio, Ascari and Moss failed to finish.

Naples—Ascari drove a Lancia to victory.

Tour de Sicily (Palermo)—Won by Italy's Piero Taruffi, driving a Ferrari.

Argentine (Buenos Aires)—Fangio triumphed as Guiseppe Farina, Italy, brought a Ferrari in second.

Mille Miglia (Brescia, It.)—Moss and his Mercedes scored a record-breaking victory in the road race of about 1,000 mi. on May 1, roaring over the course at 98.53 m.p.h. to beat the former mark of 87.96 m.p.h. John Fitch, U.S., was first in the grand tourism class for cars above 1,300 c.c. He drove a Mercedes.

Italian (Monza)—Fangio won the 26th annual event on Sept. 11, with Taruffi a close second. The race was held on a new closed course. The triumph put Fangio far ahead of all rivals for the 1955 world driving championship.

Watkins Glen (New York)—Top prize in the eighth annual race in upstate New York was won by Sherwood Johnson, Greenwich, Conn., who drove a Jaguar D. (T. V. H.)

Aviation, Civil. In the closing year of the first full decade following World War II, the air transportation industry in the United States continued a growth in passenger and freight traffic that, having begun uncertainly in the opening years of the decade, had by 1955 acquired stability, direction and extraordinary scope.

This growth was impressive and prescient of growth to come. Gross revenues for the industry in 1954 were in excess of \$2,500,000,000. The profit picture was somewhat complicated, however, by differing conditions affecting trunk lines and local service, regional, territorial and helicopter air lines. The large United States carriers did well, independent of subsidy.

Since Dec. 31, 1945, the U.S. air lines had invested more than \$850,000,000 in new equipment and in related facilities. Over the period 1939 to 1955, however, the price of the average air line ticket in the United States rose only 3.7%, and in 1955 the average price of an international ticket was actually 24.2% less than it was in 1939. With the growth of low-fare air coach or tourist-class service, it was clear by the end of 1955 that the price of the average fare would continue low in relation to the service provided and to the cost of other comparable services and commodities.

The air transport industry in the United States was gradually overcoming one of its economic problems: government subsidy. The domestic trunk line system in 1955 was virtually 100% free of subsidy, although the system of local service air lines was still dependent on government assistance.

This pronounced over-all trend toward subsidy-free operation was perhaps the most encouraging economic portent the industry had. Earl D. Johnson, president of the Air Transport Association of America during 1954, said in his annual message that "the ability of the industry to pay its own way is particularly important in view of the heavy expenditures anticipated if the air lines are to fulfil their promise of still greater usefulness. It is expected that at a minimum the U.S. domestic industry must spend one and a half billion dollars during the next ten years for new flight and related equipment."

Johnson's appraisal found an international echo in the report of Sir William Hildred, director general of the International Air Transport association, on the occasion of the tenth anniversary of that organization: "We are an industry," Hildred said, "that has to live by expansion; we cannot afford to rest on our laurels. It is our duty, and it is expected of us, ever to provide quicker and more efficient service for passengers, cargo and mail with the most up-to-date equipment available. We are still aiming at cheaper passenger service and at opening up the cargo market in a big way. Our capital expenditures on long-haul aircraft last year [1954] amounted to about \$200 million. . . . It will, I think, be that much again this year."

Recognizing this, air lines of many countries—England, the United States, France, the Netherlands and Italy, to name a few—placed orders for new equipment to meet the competitive exigencies and the calculated growth in passenger and cargo volume of the next three to five years.

In civil aviation generally, the year 1955 was one in which an aircraft took off for a regularly scheduled flight somewhere in the world every five seconds of the day and night. It was a year in which the scheduled air lines of the world served 3,500 cities from New York to Bangkok, from Nome to Sydney, from Oslo to Cape Town.

United States.—Commercial air transportation in the United States embarked in 1955 on a new and momentous—though long-anticipated—cycle of development. First, Trans-Canada Air Lines, on the New York-Toronto run, and then Capital Airlines, a regional air line operating largely in the eastern and southern United States, introduced the turboprop-powered transport into

domestic competition, using the British Viscount. Then, in June, American Airlines, the largest domestic trunk line, ordered the first U.S.-built commercial turboprop from the Lockheed Aircraft corporation—the Electra. The order was for 35 of these four-engine turboprop aircraft, with delivery to begin in the latter part of 1958 and to be completed in the middle of 1959. Characterized as a medium-size transport, the Lockheed Electra would nevertheless have a cruising speed in excess of 400 m.p.h., would seat 64 with a lounge for six persons and would accommodate 4,000 lb. of air freight, express and mail. Later in the year, American Airlines gave the Allison division of the General Motors corporation an order for Allison's Model 501 turboprop engines, rated at 3,750 h.p., to power the Electra. At about this time, Eastern Airlines announced that it had ordered 40 of the new planes.

Operationally, larger and faster aeroplanes—of which the 360-m.p.h. Douglas DC-7 was outstanding—and the continued improvement of navigation and traffic control facilities enabled U.S. domestic air lines in 1954 to reach a new high in revenue passenger-miles flown—16,768,000,000, or 13.5% higher than in 1953. The projection for 1955 indicated a total for the year considerably in excess of 18,000,000,000 revenue passenger-miles.

Total domestic air line operating revenues for 1954 exceeded \$1,000,000,000. Net profits were slightly more than \$50,000,000. This was a somewhat better return, translated into percentages, than that experienced by the world air transport industry.

As part of the general domestic picture, the 14 local service air lines, developed to link the country's important intermediate cities with one another and with the larger centres, flew 30,000 route miles with 160 aeroplanes in 1954. They served 440 cities in 42 states, providing the only air line service to 260 of those cities. In 1955 the local service carriers estimated that they would carry approximately 3,000,000 passengers, with passenger revenues probably exceeding \$35,000,000. Under a new law passed early in the year, the local service carriers, for ten years classified as an "experiment" by the Civil Aeronautics board, the industry regulatory agency, and only temporarily certificated to operate, were authorized to receive permanent operating certificates.

Statistics released during the year continued to show U.S. air line growth since 1938, the year the Civil Aeronautics act, regulating civil aviation in the United States, was passed. The number of air lines certificated to operate over specific routes had increased from 22 to 59. Aeroplanes in service increased in that period from 345 to 1,454; the number of passengers carried in a single year increased from 1,586,000 to 35,184,000; the number of people employed rose from 13,300 to 118,000; and total air line payrolls increased from \$27,396,000 to \$526,182,000.

The domestic industry established a new safety record during 1954, with .09 fatalities per 100,000,000 passenger-miles flown—the lowest ever reported by the domestic air lines. This was more than six times better than the record of .56 per 100,000,000 passenger-miles for the domestic air carriers in 1953.

The volume of airmail service in 1954 reached an all-time high, with the U.S. air transport industry, domestic and international, carrying a total of 116,809,000 ton-miles. The total for 1955 was expected to run even higher, possibly exceeding 125,000,000 ton-miles.

Meanwhile, the experimental test of flying nonlocal first-class mail between major cities in the United States continued through its second year. The Air Transport association reported that during the first year of the test senders of letters saved nearly 10,000,000,000 hr. in delivery time. Hundreds of millions of letters reached their destinations an average of 11½ hr. sooner than if they had moved by surface means. The associa-

tion said that the scheduled air lines co-operating in the test, which was being conducted on a space-available basis between New York, Washington and Chicago and other eastern seaboard cities, and between 17 major cities in California, Oregon, Washington, flew 9,600,000 ton-miles of mail the first year. Postage revenues to the post office department amounted to \$29,500,000, of which the department paid the air carriers \$1,830,000 for flying this mail. Seven trunk air lines and local service carriers were participating in the test, serving large and intermediate-sized cities in 23 states.

The increasing volume of passenger and cargo traffic brought increases in the size of the commercial air line fleet during the year. The Douglas Aircraft company delivered 31 aircraft—six DC-6bs and 25 DC-7s and DC-7bs—to seven air lines. The bulk of their production in 1955, however, was military. Lockheed Aircraft corporation delivered 54 Super Constellation's, and the Convair division of the General Dynamics corporation delivered the last 13 of its Model 340 twin-engine turboprop aircraft, to United States domestic and international air lines.

(C. R. SHAW)

Great Britain and Europe.—Big increases in traffic took place in most parts of Europe during the year, and on many of the long-distance routes there was a marked improvement. To a large extent, the rise was seasonal. For instance, the increase

passenger traffic at British airports was only 4% in April, but it had advanced to more than 25% in July and August. The heavy increase in passenger traffic in late July and August actually became an embarrassment to British European Airways (B.E.A.), which had to charter extra aircraft. There were signs that its operations would yield a much bigger profit than in the previous financial year, and there were similarly good prospects for British Overseas Airways corporation (B.O.A.C.).

In part, the traffic reflected the acquisition of suitable aircraft by the principal nationalized operators; in part it arose from the opening of additional services by new or revived operators. Deutsche Lufthansa (D.L.H.) returned to the operational field in the middle of the year, first with internal services in western Germany, then with international services from Hamburg and Frankfurt to London, Paris and Madrid, and finally with regular services across the North Atlantic. In the United Kingdom, there was some expansion of the services run by independent operators; two new motorcar ferries were opened between Southend-on-Sea and Calais, and between Scotland and Northern Ireland; and two independent companies started freight services, Airwork between the U.K. and New York city, and Hunting Clan between England and various parts of Africa. The Portuguese line also began a new service between Lisbon and Rio de Janeiro. Canadian Pacific Airways (C.P.A.) joined Scandinavian Airlines system (S.A.S.) on the arctic route, running services from Amsterdam through Greenland to Vancouver to link up with its services to Honolulu and Australia, and from Vancouver by way of the Aleutians to Tokyo.

The growth of traffic was to be explained mainly, however, by the provision of extra capacity on regular routes (a process begun in 1954 when new aircraft were coming into service on a number of lines) rather than by an expansion of the fleets. This conclusion must be modified in respect of those operators which had depended on the Comet jet liner: B.O.A.C., Air

France and South African Airways (S.A.A.). In consequence the suspension of the Comet I's, some services had to be reduced. B.O.A.C. in fact abandoned its services between England and South America. This disorganization had its effect on revenue of the companies concerned. In the financial year ended March 31, B.O.A.C.'s net profit was only £261,687, little more than a quarter of the profit made in the previous year. Air France, on its first accounting, showed a loss of £580,000. Most other companies had a satisfactory year financially. B.E.A. made a profit of £63,039 as against a loss of more than £1,750,000 in the preceding year. Aer Lingus showed a profit of £25,428. Dutch Airlines (K.L.M.), Swissair and S.A.A. likewise reported profits, but in most instances these were proportionate to the increase in traffic. In the first six months of 1955, Swissair carried more than 250,000 passengers for the first time. Most operators were satisfied that tourist fares, introduced in April 1953, were mainly responsible for the marked rise in passenger traffic.

The attention of aircraft constructors and operators was directed to turboprop aircraft. The jet liner had become a slightly less immediate concern through the setback to the development of the Comet. The decision of its makers to concentrate on the transatlantic Comet IV and the new requirements that its supercharged fuselage should be tested for fatigue strength meant that no Comet could be expected on the routes before 1958. Another jet transport, the British C.1, had attracted some attention through its use of the Comet bypass engine, which showed in tests a notable economy in consumption. However, in November its development was continued through a government decision and the Comet IV remained Britain's only jet airliner in prospect. Aircraft for shorter stages began to come forward during the year. The Herald already adopted by B.E.A. for some internal services, was added to the Queen's flight and ordered for Jersey Airlines. The Herald 40-seater began test flying and at a price of £150,000 attracted orders. The biggest—for 24—came from Australian

onal Airways (A.N.A.). The Dutch Friendship fitted with two part turboprops was also on offer. The French Caravelle, with jet engines slung from the fuselage near the tail, was ordered by Air France. (See also AIRCRAFT MANUFACTURE; AVIATION, MILITARY; CIVIL AERONAUTICS ADMINISTRATION; JET PROPULSION.) (E. C. SD.)

Agricultural Aviation.—Preliminary estimates indicated that aeroplanes covered about 50,000,000 ac. in applying insecticides, herbicides, fungicides, fertilizers and the like to farm and forest lands in the United States during 1955. This represented an increase of about 20% over 1954. In certain other areas of the world, notably Africa, Australia and several Asian countries, aerial application of insecticides, fertilizers, seeds, etc., was just starting to receive recognition as a means of combating insect pests and enhancing soil fertility.

Cotton continued to be the crop most heavily treated by aerial application. However, millions of acres of timber land were sprayed for budworm and gypsy moth in the United States and Canada, and hundreds of thousands of acres of pasture lands were treated for grasshoppers in western and midwestern states. Many areas of the world had turned to the aeroplane for effective results in ridding heavily populated sections of house and yard pests. As an example, the government of Yemen utilized an American-made twin-engine plane to spray whole towns and villages for relief from hordes of mosquitoes.

At least three new prototype planes designed especially for agricultural work appeared during the year, all having certain desirable characteristics for their intended purpose: Texas Agricultural and Mechanical college's Ag-3, Larson's D-1 and Snow's -1. Since a very large portion of all consumed agricultural chemicals was being handled through aeroplane operations, the chemical industry was devoting much of its research facilities to perfecting compounds which would be more readily adaptable to aerial application.

With the aid of the Civil Aeronautics administration and the Texas Aerial Applicators association, the Texas A. and M. college system started a school for agricultural pilots in Oct. 1955. At about the same time, a privately owned flying school in California announced a similar course. These schools were the beginning of the answer to a long-felt need for specialized training of commercial pilots in basic fundamentals and safe flying practices of agricultural aviation. (W. D. AN.)

Aviation, Military. **United States Air Force.**—During 1955 the United States air force made considerable progress toward the established goal of 137 wings by mid-1957. The programmed build-up permitted the strengthening of the world-wide strategic air forces as a force capable of instant retaliation in the event of aggression and the equipping of the tactical air forces with nuclear weapons to increase their value as a deterrent to aggression. The number of air divisions in the air defense command was increased roughly one-third, and a major expansion and reorganization of the air defense of the U.S. occurred.

The air defense command was completely modernized with all-weather jet-fighter and interceptor aircraft. The radar warning system was expanded with progress of construction of the Distant Early Warning (DEW) line across northern Canada and completion of the first of a series of offshore installations (Texas towers) in the Atlantic.

The air force stepped up its base production program to meet its goal of 137 wings. Bases in North Africa were now operational. Bases in the NATO (North Atlantic Treaty organization) countries were being extended and improved. Rapid progress was being made on bases in Spain.

The air force's ability to operate heavy and medium bombers

AIR FORCE TRANSPORTS, two prototypes of the C-130 Hercules, shown flying together for the first time in June 1955. Powered by 3,750 h.p. turboprop engines, the planes could take off or land in a distance of eight aeroplane lengths

in all parts of the world from bases on the North American continent and from within the U.S. was steadily increasing.

A reappraisal of Soviet capabilities in development and production of modern aircraft, as highlighted by the jet aircraft displayed over Moscow in May, caused the air force to take certain immediate and specific steps to speed its weapons program. Production of the B-52 long-range bomber was accelerated by 35%. Production of the F-101 fast, all-weather interceptor and the smaller F-104 supersonic day fighter was also accelerated.

Several new aircraft made their appearance or went into production in 1955. Jet B-47s had replaced propeller-driven aircraft in all medium-bomber and reconnaissance units, and the replacement of the heavy-bomber B-36, which was no longer in production, by the jet B-52 was begun. The B-58, which was expected to fly faster than any other production bomber ever built, was readied for production.

The early model jet-fighter aircraft such as the F-86 were gradually being replaced with aircraft of the 100 or Century series, such as the F-101 Voodoo, a long-range interceptor and escort fighter with atomic bomb-carrying capabilities. Jet tanker aircraft were being developed for mid-air refuelling.

A radical aeronautical development of several years previous was revealed in September with the announcement of the reasons for a new pinch-waisted design in military aircraft which had produced increases in supersonic speeds of up to 25%. The pinching of the fuselage at the point where the wings are attached greatly reduces the drag rise that occurs at speeds that approach and go beyond the sound barrier, thus enabling the aircraft to attain greater speed without an increase in power. This new development had already been applied to the supersonic jet F-102A, a delta-wing interceptor first unveiled in 1954.

The air force's initial turboprop (turbine-propeller)-powered fighter, the XF-84H, successfully test flown in July, combined the long range and ability to carry heavy loads of propeller-driven aircraft with the higher speed of jets. A new turboprop air freighter, the C-130 Hercules, went into production as a successor to the C-119 Flying Boxcar, to add the elements of speed and quantity (in addition to greater load capacity) to overseas-supply and troop-carrier missions.

The rocket-powered X-2, the first aeroplane in history designed and built to probe the so-called thermal barrier, was the supersonic successor to the famous X-1A which exceeded 1,650

m.p.h. in Dec. 1953. Both of these aircraft were designed solely for flight research purposes.

The development of atomic energy had given the U.S. a family of nuclear weapons which could now be carried by all tactical fighter-bombers and light bombers, giving tactical units greater striking power. In addition to developing nuclear weapons and aircraft to deliver them, the air force was planning to use atomic energy in the development of a new type plane. The A-plane was, however, basically a means to extend aircraft range, which could be accomplished in other ways.

Guided missiles were becoming an increasingly effective element in the air force's weapons system. Two squadrons equipped with the Matador, the first operational missile already in production, were deployed in Europe, and two more squadrons were in training in the U.S. Other guided missiles had been announced. The Falcon, an air-to-air missile, was in production for use by interceptor squadrons; the Bomarc and the Rascal were under accelerated development. The rocket-powered Atlas, also under development, was an intercontinental ballistic missile (ICBM) launched by rocket motors developing thousands of tons of thrust and millions of horsepower within seconds, which would travel at speeds of several thousand miles per hour.

In May four F-84 Thunderjets completed a routine nonstop flight of 4,840 mi. from Tokyo, Jap., to Newcastle, Austr., in 12 hr. 2 min., with mid-air refuelling. Also in May an air national guard pilot, Lieut. John M. Conroy, flying alone in an F-86 Sabrejet, flew a coast-to-coast round trip in little more than 11 hr. The pilot breakfasted in Los Angeles, lunched in New York and returned to Los Angeles for dinner in 5 hr. 27 min. 37 sec., breaking the former east-to-west flight record by almost two hours. In-flight refuelling was used.

In August ten F-84F jet Thunderstreaks set two new world's records, one for time, one for nonstop mass-flight distance, by flying 5,118 mi. from England to Texas in 10 hr. 48 min. at an average speed of 480 m.p.h. In-flight refuelling was accomplished. Also in August, an F-100C Super Sabre set the world's first speed record for straightaway flight faster than sound, more than 822 m.p.h. or 1.23 times the speed of sound.

History's biggest troop air lift, the "swapping" of more than 7,000 army paratroopers between the U.S. and Japan, began July 7, the 18th air force performing the massive manoeuvre with C-124C Globemaster transports.

Recognizing the increased importance of technically trained and experienced personnel to an all-jet air force, the air force in 1955 concentrated on such long-range problems as the improvement of service attractiveness in order to retain experienced personnel and the development of future leaders through improvement in the ROTC program and the establishment of the Air Force academy. By the end of the year these efforts, supported by new legislation, were bringing results, one measure of which was the increase in the re-enlistment rate from 22% to 35% in Sept. 1955. In August, nevertheless, the air force announced a plan to cut its basic training period by nearly 50% (11 weeks to 6 for all recruits selected for technical training) to increase the flow of technically trained personnel to operational units.

On July 11 the U.S. Air Force academy was dedicated at the temporary site at Lowry air force base near Denver, Colo., and the first class of cadets, numbering 306, began the intensive preparation as future officers of the regular air force. On Sept. 11, Pres. Dwight D. Eisenhower made an informal inspection of the academy and watched a parade of cadets. (See UNITED STATES AIR FORCE ACADEMY.)

On July 21, 1955, the air force had 956,000 men (138,000 officers and 818,000 airmen) in 124 wings, with a total of around 24,000 combat aircraft. Air force civilian strength on this date

WASP-WAISTED VARIATION of the U.S. air force jet interceptor, the F-102A, shown in flight April 15, 1955

was 312,000. The air reserve numbered 260,000 officers and airmen and the air national guard 55,000.

Secretary of the Air Force Harold E. Talbott continued in office until Aug. 13, when he was succeeded by Donald A. Quarles (q.v.). In June Gen. Nathan F. Twining was reappointed to a second term as chief of staff, U.S. air force. (See also AIRCRAFT MANUFACTURE; NATIONAL GUARD.) (N. F. T.)

United States Navy.—Naval air operations literally covered the waters of the globe during 1955. Carriers operated the U.S. 6th fleet in the Mediterranean and with the 7th fleet in the western Pacific. En route to distant stations, they rounded both the Cape of Good Hope and Cape Horn. A patrol squadron returned to Whidbey Island, Wash., from the far east by way of the Indian and Atlantic oceans while others patrolled from Newfoundland, Newfoundland and North Africa, and yet another among the first U.S. forces to operate in Spain. Helicopters and patrol planes conducted ice reconnaissance for ships en route to arctic waters and helicopters surveyed the antarctic ice in preparation for Operation "Deep Freeze." Carrier aircraft and helicopters aided disaster victims in the Caribbean, Central American and New England areas. The 7th fleet completed significant operations in support of national objectives in the western Pacific under delicately balanced international tensions.

Under the firm belief that strength lies in striking power rather than in mere numbers, primary emphasis in the aviation program was on the improvement of weapons, materials, maintenance and the techniques required to exploit them. Commissioning the U.S.S. "Forrestal" on Oct. 1, launching the U.S.S. "Independence" on Oct. 8, laying the keel for the U.S.S. "Independence" in July, completing the third steam catapult and angled deck installation, beginning the first assault helicopter aircraft conversion and the practical completion of the HR2S helicopter development to meet marine corps tactical commitments marked both actual and potential increases in fleet air strength.

Although new aircraft deliveries continued on the downward trend first noted in 1953, several new models reached

et. Among carrier planes placed in operation, the F7U Cut-throat added a high-performance fighter with missile launching capability, while the FJ-3 Fury, which in January established an unofficial climb record of 10,000 ft. in 73 sec., added high-altitude interceptor capability. Fighters in flight test included the F8U, which exceeded the speed of sound on its first flight; the FJ-4, an improved version of the operational Fury; the A4D Skyray, world speed king and newest holder of the climb record with 56 sec. to 10,000 ft.; and the F11F, which incorporated many design refinements including the "coke bottle" fuselage. In the attack category, tests of the A3D and A4D demonstrated the speed, range and carrying capacity characteristic of heavy offensive power. Trends in aircraft development and in training for their employment were toward all-weather operations and increased potential for delivering atomic weapons. Substantial numbers of operating aircraft and all models under development had these capabilities.

In patrol aircraft the new P5M-2 Marlin seaplane and the P2V-7 Neptune landplane with supplemental jet engines both demonstrated acceptable ability to detect and attack submarines. The P6M SeaMaster, a swept-wing jet seaplane, first flew in July. Designed for mine laying and reconnaissance, and adaptable to other tasks, this plane was expected to open horizons of operational use hitherto untouched by seaplanes. The new PG-2 and ZSG-4 airships replaced old equipment in two of the four antisubmarine squadrons.

Three major guided-missile systems were introduced: Sparrow, an air-launch interceptor, Regulus I, a surface-bombardment type, and Terrier, a surface-launched air defense missile. Terrier firings on the U.S.S. "Mississippi" provided practical experience for trainees destined to serve aboard the missiles cruiser "Boston" in 1956. Regulus launching and firing exercises were conducted about the submarine "Tunny," the missiles cruiser "Los Angeles" and the aircraft carrier "Hancock." Addition of this weapons system to the fleet arsenal raised the level of air defense to a degree commensurate with advances in nuclear weapons and jet aircraft, and also added high destructive power and increased versatility to offensive capabilities. (See also MARINE CORPS, U.S.; NAVIES OF THE WORLD.)

(T. S. C.)

Air Forces of the World.—The first serious attempt to break through the veil of secrecy that normally surrounds the power potential of the east v. the west occurred in 1955 with Pres. Dwight D. Eisenhower's dramatic suggestion of mutual inspection of aeronautical installations. By the end of the year, however, no definite indications were forthcoming that the proposal might be acceptable to the U.S.S.R. Meanwhile, western powers continued to build up their aerial strength by augmenting their own air armaments and by mutual contribution to the common cause through NATO.

Under the U.S. offshore procurement program a limited number of U.S.-designed aircraft and components were coming out of certain selected European aircraft factories. At the same time the major powers of the western group were coming up with prototypes of improved equipment for NATO. Notable in the latter group was the agreement to build lightweight, high-performance fighters in the category of the British Folland Midge and the French modifications of the Mystère and Vautour.

As in past years, the capabilities of Soviet aviation were kept well under wraps. Glimpses of new aircraft at aviation displays provided material for much speculation, but authentic data were lacking both as to quality and quantity of Russian aircraft. The assumption was, however, that Soviet air technical capabilities were at least equal to those of the United States.

U.S.S.R.—As in previous years, whatever of U.S.S.R. air capabilities was learned could be gleaned only from observation

CELESTIAL NAVIGATION TRAINER, a rotating mechanical model of the northern skies, used at Mather Air Force base in California in 1955 to teach navigators how to use star fixes in trans-polar flights

of Russian aircraft in flight and from reports originating from scattered sources outside the Soviet Union.

Once more the flying demonstration put on by the Soviet air force during the May day celebrations in Moscow revealed some details of new military aircraft and possible clues to recent Soviet activity and potentialities. New jet fighters and bombers were disclosed, and some known bombers appeared in larger formations than previously. One source reported that at least 50 supersonic day fighters were displayed publicly for the first time. These aircraft featured wings with a sweep back of about 60° and a low-set horizontal tail, with performance estimated in the 1,000 m.p.h. class. Also seen were 30 new all-weather fighters which had thin, straight wings and engine air intakes on both fuselage sides. Another feature of the display was a formation flight of nine swept-wing bombers each fitted with four turboprop engines driving contrarotating propellers. The configuration of these aircraft suggested additional uses as aerial tankers or long-range strategic reconnaissance aircraft.

Approximately 50 twin-jet Badger (type 39) bombers and 10 Bison (type 37) bombers participated. In the previous year's May day ceremonies only nine Badgers and one Bison were noted. In some quarters this increase in the numbers of these bomber aircraft, and the introduction of the new bomber and fighter types, were considered to be evidence of a step-up in Soviet development and production of military jet aeroplanes.

Further unconfirmed details were learned of the Bison and the Badger. The Bison, supposedly comparable in performance with the B-52, appeared to have aerodynamic twist in the wing and was equipped with tip fuel tanks. The landing gear was of the tandem type located fore and aft of the bomb bay; two outrigger wheels were installed in the wing. The Badger resembled the B-47 in size and seemingly had tricycle landing gear. Details

U.S. NAVY SEAPLANE TRANSPORT, R3Y Tradewind, 80-ton turboprop plane designed for speeds of more than 350 m.p.h.

of armament on either of these types were scanty.

The Soviet designer S. Ilyushin was credited with a new swept-wing bomber, the IL-28-2. It was stated to attain a speed of 621 m.p.h. and to be in production. A four-engined, straight-wing turboprop bomber was reported unofficially, credited to a new designer, V. Myasishchev. The Ilyushin IL-13 was described as a long-range bomber equipped with turboprop power plants; it was a low-wing configuration with modest sweep-back on wings and tail.

At the flying display at Moscow's Tushino airport on Air Force day, July 3, approximately 50 hitherto unknown twin-jet all-weather fighters made their first appearance. These were followed by a similar number of single-jet supersonic fighters, possible successors to the MIG-17. Also shown for the first time were four twin-rotor helicopters outfitted for carrying troops and supplies.

The U.S.S.R. had developed a new power plant from the Junkers diesel aeroengine which gave reconnaissance aircraft a range of 8,700 mi., according to a Soviet occupation official in east Germany.

The U.S.S.R. was reported to have a string of 21 guided-missile bases along the Baltic coast, stretching from Porkkala point near Helsinki, through Estonia and Latvia, around the Gulf of Riga to Liepaja and down through Lithuania and Poland into east Germany. Four bases were said to be situated on the Estonian islands of Saaremaa and Hiiumaa, the largest of which could allegedly fire 800 missiles an hour. Gains in the development of intercontinental ballistic missiles were mentioned in one official statement.

Great Britain.—The so-called "V" bomber force (to be made up of Vickers Valiants, Avro Vulcans and Handley-Page Victors) appeared to be slowly gaining in momentum during 1955. All three of these machines had been in prototype stages for some time but during the year one of them, the Valiant, was actually delivered to squadrons for service testing. In the meantime, the lightweight bomber, the twin-jet Canberra, was produced in quantity and in various versions, and formed the backbone of British bomber squadrons. One of these planes made a spectacular round-trip crossing of the Atlantic between dawn and dusk in late August.

Great emphasis was being put on research, particularly in the field of short take-offs and landings. The so-called "flying bedstead" demonstrated that vertical take-offs were possible from pure jet reaction. Research was also going forward in so-called boundary layer control and various forms of jet deflectors for

this same purpose.

Work continued through the year to improve the thrust of engines of all types. This was supplemented by active work in liquid-fuel rocket motors both for assisted take-off and use in guided missiles.

It was well known that extensive guided missile research experimentation was continuing both in England and at the guided missile range at Woomera, Austr., but little information was being released from these areas.

As was customary, Great Britain put most of its new aircraft on display at Farnborough in early September. This was reported as the largest such display ever staged there. The exhibition totalled 307 stands. Forty-one aircraft took part in the flying display, and the static display brought the total number of planes exhibited to nearly 60. Of these, 16 made their maiden display at Farnborough. In addition R.A.F. formations participated for the first time, with flights of Valiant and Handley-Page aircraft. Many of the machines shown the previous year as prototypes appeared in 1955 in production form, e.g., R.A.F. Hawker swept-wing fighters and Vickers Valiant "V" class bombers. There was seen also a formation of Short Seamew light submarine aircraft, which were in production both for the R.A.F. and the royal navy. Among the aircraft flown at Farnborough were the Avro Vulcan four-jet delta bomber, the Avro Canada CF 100, and the Folland Gnat lightweight fighter. Another technical development of note was the new Rolls-Royce Conquest turbojet engine which was flown in an Avro Ashton.

Announcement was made in July of a new photoreconnaissance version of the English Electric Canberra twin-jet bomber. Known as the Canberra Mark 9, it was ordered in quantities by the R.A.F. Under production for the R.A.F. were the Hawker Hunter F.1 (Rolls-Royce Avon) and F.2 (Armstrong Siddeley Sapphire). Also in large-scale production was the F.4 with a new version of the Avon. The British ministry of supply let a contract for the DH 110 jet fighter for the royal navy. This two-seat day and night all-weather fighter, powered by two Rolls-Royce Avon turbojet engines. An R.A.F. operational squadron was being equipped with Vickers Valiants, with the Handley-Page Victor and Avro Vulcan being in service elsewhere. The 700-m.p.h. Hawker Hunter Mark IV jet fighter was put into service with the R.A.F. in Germany in April. The Avro Ashton, Britain's smallest and lightest fighter, the Folland Gnat, made its maiden flight in July. The Bristol Orpheus turbojet was also making its initial air test. Several Short Seamews were nearing completion and were to be delivered to the R.A.F. coastal command. They would have folding wings, presumably to allow them to

operate from fleet air arm carriers if required.

France.—Although several interesting prototypes were shown at the French air display in June 1955, actual production of military aircraft lagged during the year. The most notable contribution toward the NATO effort was the selection toward the end of the year of two basic fighter types, the Mystère IV and the S.O. Vautour, as stripped-down lightweight fighters comparable with the British Folland Gnat. The expectation was that such planes, because of their simplicity, could be produced in quantity and be used as defensive armament against long-range bombing attacks. Dassault was producing a series of modifications of the Mystère IV. This plane was first flown two years earlier but appeared during 1955 in various versions, day and night fighters.

A so-called Super Mystère which was flown during the year was said to have exceeded the world speed record. An entirely new model of delta-wing design intended as an interceptor fighter was reported having been test flown in June.

A twin-jet S.O. 4050 Vautour was in production as an all-weather fighter (two-seat), as a ground attack aircraft (single-seat), and a bomber (two-seat). The first preproduction model was officially handed over to the French air force in March, and the first of 140 production models were to be delivered in the spring of 1956. This aircraft could carry a variety of military loads, including a tactical A-bomb, with little change in performance.

Italy.—The first North American F-86K to be assembled by Fiat in Italy was successfully test flown during 1955. The Fiat design G.82 by Gabrielli, a swept-wing jet trainer powered with a Rolls Royce Nene engine, was said to have flown 638 m.p.h. in level flight. A new lightweight tactical fighter powered with a Bristol Orpheus engine was ordered by NATO. The U.S. air force and the Italian air force jointly ordered three prototypes of lightweight Arietes from Aerfer of Naples. The Fouga 170R Magister jet trainer was test flown in June.

Sweden.—Sweden announced a ten-year plan for modernization of its defenses, in which guided missiles would play a leading role, to parallel the Soviet guided missile bases along the Baltic coast. Sweden test flew its SAAB J-35 1,000-m.p.h. fighter in 1955.

The SAAB J-29 Flying Barrels were still in production. Delivery began of the 750-m.p.h. all-weather SAAB Lansen.

West Germany.—The new air force, planned to be an integral part of the Allied air forces central Europe, was to be purely tactical, supported by six squadrons of transport aircraft. Total strength was expected to be 80,000 officers, noncommis-

FRENCH JET FIGHTER, the Trident, which on May 2, 1955, passed through the sound barrier while still climbing and was claimed to have additional power in reserve in its booster rockets

sioned officers and airmen, and 1,326 aircraft, organized into 20 wings, each consisting of three squadrons. Training was to begin in 1955, with readiness for operational duty expected in 1958. The first men of the west German armed forces to be called up would be about 200 pilots who would begin a NATO jet conversion course in Germany. They would be followed by a number of German staff officers who would complete a staff course at NATO headquarters at Paris. According to the U.S.-German military aid agreement announced in July 1955, the Germans would receive a number of F84F's for their fighter-bomber wings and RF84F's for their reconnaissance wings. Expected to be established were six major maintenance and repair bases which would serve all 20 wings. Once plans were set, the U.S. air force would guide training courses for an initial 600 volunteers: 120 for flight instructor positions, 400 as technical instructors and 80 in flight-control methods. Each of these courses would last approximately four months.

Thereafter, recruitment and induction of German air force service personnel would commence.

Spain.—It was reputed that the former German designers W. Messerschmitt, E. Heinkel and C. Dornier were serving as consultants to aircraft companies in Spain. The first Spanish-built jet plane made a trial flight in August. It was built by Hispano Aviación. One of the designers was Willi Messerschmitt. In Jan. 1955 the Spanish government was reported to be forming three new fighter and bomber squadrons for 1957, with the aid of aircraft deliveries from the United States. Types were expected to be similar to those used in the Korean war.

Japan.—A Japanese defense ministry spokesman reported that defense plans included 1,200 aircraft by 1960-61. In 1955 Japan had 6,000 air force personnel. The naval force was to have 165 aircraft. The air force would be composed of 450 F-86F jet fighters, 150 F-86D all-weather fighters and 472 trainers. The Japanese, during the summer, signed an agreement with the U.S. whereby 70 North American F-86F Sabres and about 100 Lockheed T-33A jet trainers were to be assembled, with U.S. aid, in Japan.

Japanese manufacturers began development work on three types of two-place light jet trainers powered with the French Turboméca Marboré II or Japan jet engine JO-1.

Bacteriology. **Chemotherapy in Tuberculosis.**—With the advent of streptomycin in 1944, Selman Waksman provided the first practical antibacterial weapon in the fight against tuberculosis. In less than two years of use it became apparent that this antibiotic was effective in limiting the spread of infection in some cases but in others the tubercle bacillus developed a tolerance for the drug, making its administration ineffective.

The discovery of two other tuberculostatic agents, para-amino-salicylic acid and isoniazid, shortly led to a system of combined therapy with streptomycin. Although the frequency with which resistant organisms developed was greatly reduced by this attack from two or three antibacterial pathways, a number of patients requiring prolonged therapy sometimes developed tolerance to one or all of these drugs. During 1955 two more agents were added to the antitubercular armamentaria, pyrozinamide and cycloserine. The former had been used some time earlier with very limited effectiveness and could not be shown to have any action on freshly isolated *Mycobacterium tuberculosis* in the test tube. Its use gradually was abandoned in favour of para-amino-salicylic acid and isoniazid. During the year, however, workers at the U.S. army's Tuberculosis centre discovered that pyrozinamide was very active in limiting the growth of tubercle bacilli which had become resistant to isoniazid. The drug was therefore being re-evaluated in combined therapy with isoniazid and streptomycin. Cycloserine, obtained from a soil streptomycete, showed some promise in treatment of those cases where resistance to the other antibiotics had developed. Although both pyrozinamide and cycloserine upon prolonged ad-

ministration at high dosage levels are toxic, the effective concentrations required to inhibit the bacilli are sufficiently low that neither agent when properly used need be dangerous.

Versatile Millipore Filters.—Available as an item of mass production during 1955 was a filtering medium with a uniform cell structure that approaches unimolecular dimensions which may be likened to a submicroscopic honeycomb section. The volume defined by this material is approximately 80% voids, or about 50×10^6 pores per square centimetre. As a filter it acts as a two-dimensional screen in providing a barrier to suspended particles, and because of this retained particles are in a virtual plane defined by this surface. Retained microorganisms may be cultured on the surface when the bottom of the filter sheet is placed in wetting contact with liquid nutrients. The liquid medium diffuses through the porous sheet, thus supplying the deposited microorganisms by capillarity.

Bacteriologists of many interests found this filter a valuable tool in their work. In water and sewage sanitation, the liquid to be checked can be drawn through the filter. After the filter has been placed in a plate containing the proper selective medium and incubated, the colonies indicative of faecal pollution can be sought and counted when present. Similar methods were being employed by firms wishing to check the sterility of large or small quantities of a liquid product. By adjusting the selective action of the medium in which the filter was incubated, this technique was used to determine the content of each of several specific bacteria in a product. Equally successful were efforts to check the bacterial pollution of air. This technique could prove extremely valuable in the event of a threat of bacteriological attack, by functioning as an air monitor. In this case there would be a disadvantage in that the results of each check would not be available until the end of the 12- to 18-hour incubation period.

These filters were recently adapted as monitors of industrial pollution of air by acid aerosols and metal fumes. Likewise, their use in measuring the radioactivity of dust in the air was demonstrated.

The Mystery of the Yellow Bacillus.—Bacteriology laboratories around the country had for several years frequently isolated a "yellow" bacillus from patients with a disease resembling tuberculosis. Morphologically the organism resembles *Mycobacterium tuberculosis*. Unlike the tubercle bacillus, however, the organism produces colonies ranging in colour from cream to yellow, does not easily infect guinea pigs, and is not susceptible to existing tuberculostatic agents. This disease appeared to have a gloomy prognosis, which, however, might have been only a reflection of the severity of cases observed. It was not known whether the organism occurred in mild infections as well. The problem was further complicated by the frequent observation that the typical tubercle bacillus growing on artificial media containing isoniazid or para-amino-salicylic acid sometimes produce a few coloured colonies. Likewise, yellow organisms have been isolated from some patients who previously harboured susceptible, typical tubercle bacilli. It was not yet known whether the yellow bacillus was a new species, as some workers had proposed, or a natural mutant which chemotherapy had selected and hospital contacts were spreading.

Cariou Teeth.—Tooth decay may be widespread in a tooth long before the dentist can detect a cavity. A group of scientists at the University of California had evidence which indicated that bacteria may penetrate tooth enamel in minute threadlike chains, making a microscopic hole. Once beneath the enamel, the bacteria may spread out and destroy the dentine. *Lactobacillus acidophilus*, long thought to produce acid which eventually destroys the enamel, may not be a major factor. Frank Orla showed that enterococci (common intestinal members of the

"FISTULATED" STEER at Virginia Polytechnic Institute, Blacksburg, Va., undergoing examination by bacteriologists, biochemists and nutrition experts to determine the processes by which cows convert plants into meat and milk. Each of the experimental cows had "windows" cut into its side, thus permitting scientists to observe digestion or to remove the contents of the stomach for examination, as the photograph shows. The operation and subsequent examination are painless to the animal.

streptococcus family), when painted on the teeth of germ-free rats, produced caries. Microscopic sections of the teeth revealed that the enterococci had deeply invaded the decayed areas. These infections occurred in the absence of lactobacilli.

Psittacosis.—Psittacosis or parrot fever is a virus-caused lung disorder, something like pneumonia or influenza. The disease gets its name because it was first discovered in parrots and birds of the parrot or psittacine family. It has been found likewise in pigeons, canaries, chickens and turkeys. The nonparrot form is called ornithosis. Humans get it from contact with sick birds and from dust that gets contaminated with virus. During 1954 an outbreak of 97 cases developed in turkey-processing plants in Texas. Although there were no deaths, the disease was severe, and there were some relapses in patients treated with antibiotics.

During 1955 steps were proposed to eliminate this threat to bird-lovers and poultry raisers by treating the birds with achromycin or aureomycin. Breeders who employed this practice reported that the virus had been eliminated from their birds.

Antibiotics in the Orchard.—In the first successful large-scale commercial orchard trial using sprays of terramycin and streptomycin mixtures, fire blight was checked with 98% efficiency in controlled tests in Marysville, Calif. Fire blight causes annual losses of \$70,000,000 in the U.S., and has destroyed pear growing east of the Mississippi. It has also made inroads on commercial apple production.

These antibiotics were also being used on hitherto uncured bacterial diseases of tomatoes, peppers, beans, walnuts and potatoes. (See also POLIOMYELITIS; SALK, JONAS EDWARD.)

Badminton. Joseph Alston of South Pasadena, Calif., and Eddy Choong, the defending champion from Penang, Malaya, met in the final round of the American Badminton association's open tournament in April 1955, with the laurels going to Alston. The competition, held at Long Beach, Calif., drew a field of the world's top players and Alston took the men's singles honours with a quick triumph at 15-5, 15-8. Margaret Varner of South Hadley, Mass., dethroned Judy Devlin of Baltimore, Md., as queen of the women contestants, winning by 6-11, 12-9, 12-9, to avenge the loss she had suffered in the 1954 title match. Alston paired with Wynn Rogers of Arcadia, Calif., to set back Eddy Choong and Daryl Thompson, Vancouver, B.C., 15-6, 12-15, 15-9, for the men's doubles crown. The Devlin sisters, Judy and Sue, again won the women's doubles event, conquering Janet Wright, San Francisco, Calif., and Thelma Welcome, Glendale, Calif., 15-10, 15-9. Rogers and Dorothy Hann, Los Angeles, Calif., carried home the mixed doubles prize by subduing Joseph and Lois Alston, 8-15, 15-11, 15-9. Roy Lockwood and Richard Fleming, Glendale team, took the veterans' doubles by conquering Wayne Schell, West Newton, Mass., and Fred Fullin, South Norwalk, Conn., 17-14, 12-15, 15-13.

John Kevorkian, Watertown, Mass., retained the boys' singles title in the United States junior tourney at Cleveland, O., in April. Other victors included McGregor Stewart, Baltimore, girls' singles; Kevorkian and Gary McFarlane, Lewiston, N.Y., boys' doubles; Norma Slauer and Nancy Metcalfe, Marblehead, Mass., girls' doubles; Kevorkian and Norma Slauer, mixed doubles.

Margaret Varner scored a surprise in the women's final of the all-England championships at London in March when she defeated Judy Devlin in the ultimate round, 9-12, 11-5, 11-1. Wong Peng Soon of Malaya beat the defending titleholder, Eddy Choong, 15-7, 14-17, 15-10, in the men's event. Other victors were Iris Cooley and June White, England, women's doubles;

Finn Kobbero and Jorgen H. Hansen, Denmark, men's doubles; Kobbero and Kirsten Thron Dahl, Denmark, mixed doubles. In Canada, Jean Wearing of Calgary, Alta., won both the junior girls' and women's championships and Don Smythe of Toronto, Ont., retained the men's title. Paul Holm of Montreal, Que., gained the world professional crown by beating a fellow townsman, Stan Cutts, 15-3, 15-11 and 15-2, 15-3, in the best two of three matches at Montreal.

Malaya won the Thomas cup, symbol of world supremacy in the sport for the third straight time when it routed Denmark, 8-1, in the challenge round at Singapore in June. Twenty nations competed for the prize, which Malaya won in 1949 and retained in 1952. Denmark advanced to the last round by subduing India, conqueror of the United States team. (T. V. H.)

Bahama Islands. This British colony consists of 21 inhabited and 680 uninhabited islands off the Florida coast. Area: 4,404 sq.mi. Pop.: (1954 census) 84,581 (about 83% Negro). Language: English. Religion: Christian. Capital: Nassau (pop., 1952 est., 36,243), on New Providence Island. Governor in 1955, earl of Ranfurly.

History.—Princess Margaret visited the Bahamas in Feb. 1955, arriving in the royal yacht "Britannia" from Jamaica on Feb. 26 and leaving by air on March 2. Tourism was again the colony's principal source of earnings. Visitors in 1954 numbered 109,000, a new record, and revenue from the tourist traffic in 1955 was forecast at £3,300,000, very largely in dollars. The construction of new terminal buildings was begun at Windsor field, which was to replace Oakes field as the main airport. The freeing of Oakes field would permit expansion of the city of Nassau, with consequent relief of overcrowding. Measures were approved for dredging a deep-water channel and harbour, able to accommodate large freighters, and the construction of a large industrial project at Hawksbill Creek, Grand Bahama. The plan, to be undertaken by the Grand Bahama Port Authority, Ltd., called for the setting aside of 50,000 ac. of land and the development there of, among others, lime, cement and building board manufacturing industries using local raw materials. A free port area was proposed as part of the plan. (R. H. Y.)

Education.—Schools (1953): primary 176, pupils 20,994; secondary 7, pupils 1,194; technical 1, pupils 403; 1 teachers' training college, with 43 students.

Finance and Trade.—Monetary unit: pound sterling; U.S. and Canadian dollars generally accepted. Budget (1954 actual): revenue £3,095,541; expenditure £3,008,515. Foreign trade (1954): imports £9,400,000; exports £1,310,000. Main exports: pit props, lumber, crawfish, salt, okras, tomatoes (canned and fresh).

Bahrein: see ARABIA.

Baking Industry. The following statistics on the production of the wholesale segment of the U.S. baking industry compare 1954 tonnage (published in 1955) with the 1947 tonnage, the latter figures being from the most recent census of manufactures. These figures are only for the wholesale segment of the industry, which are those bakers selling their products through grocery stores, hotels, restaurants and institutions. Retail bakers, multiple-unit retailers and house-to-house bakers are excluded because they are not included in the annual survey from which the figures are taken.

Nutrition.—For years the "Bakers of America" program, under the sponsorship of the American Bakers association, had been aimed at stimulating a greater demand for bakery products. During 1954 and especially 1955, the theme shifted to a concentrated educational campaign on the nutritional value of baked foods. The "Better Breakfast" campaign in February and March was aimed at educating the public to get into the habit of starting the day with a good breakfast which would include toast

Wholesale Production of Bakery Goods in the U.S.

Item	1947	1953	1954	Per cent change, 1947 to 1954
White bread, lb.	8,340,728,000	9,697,878,000	9,726,971,000	+16.5
Other bread, lb.	1,667,613,000	1,886,838,000	1,947,216,000	+16.4
Sweet goods, lb.	402,522,000	398,138,000	402,500,000	...
Cakes, lb.	1,210,207,000	1,131,237,000	1,108,603,000	-8.5
Pies, lb.	505,269,000	477,575,000	459,666,000	-9.2
Doughnuts (doz.)	256,992,000	285,167,000	282,316,000	+9.8
U.S. population	141,270,000	158,375,000	161,000,000	+14.0

and sweet goods. The "July is Picnic Month" and the "August is Sandwich Month" promotions were successful in stimulating summer sales in bread and buns. Scheduled for the months of October through December was the "Dessert Festival," a promotion program to encourage the greater use of bakery products as desserts.

In one month, American Institute of Baking, Chicago, Ill., filled 4,225 requests for more than 400,000 pieces of literature on nutrition.

Stable Ferment Process.—This process, introduced in 1954 by the American Dry Milk institute was being used in 1955 by 34 bakers throughout the country. Six of these bakeries were operating 100% of their bread production under the ferment process.

The ferment includes water, nonfat dry milk solids, corn sugar, salt, yeast and yeast food. Water is metered into a stainless steel tank to combine with the other ingredients. This ferment is agitated slowly for five or six hours and after cooling, remains stable for several hours. It is then metered into the dough mixer to combine with flour, sugar, lard and more yeast and yeast food.

The American Dry Milk institute had received more than 700 written inquiries for detailed information on the Stable Ferment Process.

Facts and Figures.—The U.S. census bureau listed 27,000 bakeries in the nation. Those actually baking for wholesale or retail totalled 22,000, the remainder being retail outlets only. About 7,000 of these 22,000 bakeries have annual sales in excess of \$50,000.

The total number of workers in U.S. bakeries during April 1955 totalled 280,500 compared with 282,700 in April 1954. Of these, production workers numbered 169,600 compared with 174,200 a year previous. Average weekly earnings for bakery employees was \$70 compared with \$68.39 in 1954; weekly hours were 40.7 compared with 41.2; hourly earnings averaged \$1.72 as against \$1.66. In the biscuit, cracker and pretzel group, weekly earnings averaged \$60.22 and \$60.83; weekly hours, 38.6 and 39.5 and hourly earnings, \$1.56 and \$1.54. (See also WHEAT.)

Baltimore.

Baltimore is the metropolis of Maryland and had an estimated population of 966,000 in June 1955. The land area of the city is 78.72 sq.mi.; the water area, 13.21 sq.mi. Mayor in 1955: Thomas D'Alesandro, Jr., Democrat.

Budget appropriations for 1955 were \$183,436,904.48; for

1954 they were \$174,508,386.47. The city tax rate for 1955 was \$3.05 per \$100 of assessed valuation, and the rate for 1954 was \$2.82. The taxable basis for 1955 was \$2,936,005,029, and for 1954 it was \$2,846,003,019. The gross funded debt as of June 30, 1955, was \$281,100,200; the sinking funds amounted to \$28,334,108, leaving a net debt on that date of \$252,766,092, not including accrued income. The percentage of net debt to the taxable basis (excluding self-supporting indebtedness) was 5.51% as of June 30, 1955.

The net enrolment on Oct. 31, 1954, in the public schools of the city was 86,624 white students and 57,064 Negro students; in addition, 24,801 students were enrolled in adult education classes. John H. Fischer was superintendent of the Baltimore city schools. The public schools of Baltimore are a separate and distinct unit and are not under the jurisdiction of the state department of education. The integration of schools for white and Negro students was carried into effect in Sept. 1954.

Ranking as the second United States port in foreign trade by tonnage, Baltimore had a combined value of exports and imports at the port during the year 1954 amounting to 19,010,100 tons, a decrease of 11.1% from the 21,397,300 tons for the previous year. The decline in foreign trade volume resulted from substantially reduced overseas shipments of coal, grain and iron and portations of metallic ores during the year. The port's foreign commerce in 1954 was valued at \$944,000,000, as against \$913,400,000 in 1953. New port records were established in 1955 when 4,829 ocean-going vessels in all categories of water-borne trade arrived at Baltimore and 4,178 deep-draught ships utilized the C. & D. canal route to and from the port.

The moderate letdown in industrial activity during 1954 was attributable to the adjustments of military orders following the Korean cease-fire agreement, to the working off of unbalanced inventories and to substantially lower operations at the shipyards. The initial half of 1955, however, saw a considerable pickup in shipbuilding and repairing as well as the establishment of a new high production record for the steel industry.

At the midpoint of 1955, the ten leading industry groups, in order of volume of employment, were primary metal industries (39,800), transportation equipment (34,200), food and kindred products (22,400), apparel (16,400), fabricated metal products (15,300), electrical equipment (11,300), chemicals (9,900), printing and publishing (9,200), nonelectrical machinery (7,300) and stone, clay and glass products (5,300).

Baltimore's marked growth in new production facilities continued in 1954 with a total announced investment of approximately \$100,000,000 for new plants and expansions. The increase in the local manufacturing capacity was greatly accelerated during the first seven months of 1955, when the announced investment for such purposes amounted to \$185,000,000, a sum that far exceeded the total for any full year in the history of the community. (C. N. E.)

Bananas: see FRUIT.

Banking.

Demands for credit and capital funds generally were extremely high in the United States during 1955. Mortgage financing, instalment credit financing and commercial and industrial loans were especially strong. The Federal Reserve pursued a monetary policy of restraint with growing severity and the treasury department offered a long-term bond. Interest rates, and particularly short-term money market yields, rose during the year.

Demands for Credit and Capital.—Home mortgage financing increased during most of 1955 at a record rate, reflecting very high levels of residential construction, particularly in the first half of the year. Mortgage debt outstanding secured

one- to four-family nonfarm houses stood at \$82,100,000,000 on June 30, 1955, an increase of \$12,200,000,000 over the figure a year before. Of the total outstanding, Federal Housing administration-insured debt amounted to \$13,500,000,000, Veterans administration-guaranteed debt accounted for \$22,000,000,000, and conventional mortgages stood at \$46,500,000,000.

Mortgage credit was tightened in many markets starting in the spring of the year. Available funds were somewhat reduced by monetary and debt-management policies. On July 30 the Veterans administration and the Federal Housing administration raised minimum down payment requirements by 2% and shortened maximum maturities to 25 years. Mortgage warehousing was frowned upon by federal reserve officials, and the federal home loan banks restricted borrowing by savings and loan associations. Late in the year there was some apparent easing of these restraints on housing loans.

Total instalment credit outstanding rose \$4,760,000,000 in the year ended Sept. 30, 1955, with \$1,370,000,000 of the increase representing holdings by commercial banks and \$2,370,000,000 taking the form of higher holdings of sales finance companies. Credit extended in the stock market rose but was restrained by higher margin requirements.

Commercial and industrial loans at weekly reporting member banks went up during the year by about \$3,000,000,000. These loans rose sharply during the first half of the year as against decreases in the first half of 1954 and even 1953. In the second half of the year a further increase continued in greater than usual seasonal proportions.

Corporate offerings of securities for new money were at a high level in 1955, but not at a record rate. Such securities offerings amounted to \$6,780,000,000 in 1954, as compared with the record level of \$8,180,000,000 in 1952 and \$7,960,000,000 in 1953. Total corporate offerings of securities for new money in the first eight months of 1955 were about 11% over those in the corresponding period of the previous year.

Significant differences appeared among groups of business enterprises in the pace of their securities offerings. New money issues by manufacturing firms in the first eight months of 1955 were up 44% over those in the same months of 1954, with much of the increase taking the form of common stock offerings. Internal financing through depreciation accruals and retained earnings, however, bulked much larger as a source of funds than securities offerings. Likewise, securities offerings by financial companies in January through August 1955 were more than four times those in the corresponding period a year before, with the increase coming primarily in debt obligations of sales finance companies.

Interest Rates.—During most of 1955, interest rates moved upward. This was particularly true of short-term money market rates which were under the continuing pressure of restrictive monetary policies. Four increases brought the discount rate at the federal reserve banks from 1½% early in April to 2½% late in November. The rate on new issues of treasury bills rose from .616% in early June 1954 to around 1% at the turn of the year and then to 2.440% late in November. This was the highest such rate since 1933, although it was just slightly above the high of 2.416% reached in June 1953. Dealers raised commercial paper rates eleven times and finance companies nine times during the year. In late November, yields on prime four-to-six month commercial paper were 2⅞% compared with only 1⅞% at the start of the year. The yield on major finance company paper rose from a minimum rate of 1⅞% when the year began to 2½% to 2⅞% in late November. During 1955 there were two increases in the prime rate on commercial loans, from 3% to 3¼% on Aug. 2 and from 3¼% to 3½% on Oct. 14. The 3½% rate was the highest in 25 years, and was above the 3¼% level

reached in 1953.

Yields on Aaa corporate bonds rose slightly from a low of 2.86% in April 1954 to 2.92% at the turn of the year, and then went up to 3.14% in September. By mid-November the Aaa yield had declined somewhat to 3.08%, however, and the high yield in the year was far short of the high of 3.44% for the year 1953. The average yield on outstanding high grade municipals rose from a 2.36% low yield earlier in the year to a high of 2.69% but stood at 2.52% by mid-November.

Yields on long-term treasury bonds generally rose and prices fell during 1955, with significant fluctuations during the year. The long-term 3½% government bonds declined from a high price of somewhat more than 110 early in 1955 to a low of 104 in August, at which price the yield was 2.99% to call. By the first of November, however, the price had risen to over 106 to yield 2.87% to call, but by later in the month had fallen again to below 105 to yield about 2.94%. In February and in July the treasury offered a 3% bond due in 1995, a 40-year maturity, not callable, the first treasury bond issue with a term of more than 30 years offered since 1911. This bond displayed unusual strength as a result of demand from pension funds and freedom from pressure of liquidation. Intermediate bonds were under rather severe pressure during the year, however, as some banks sold them to make loans and as other nonbank institutions sold them to raise funds for mortgages.

The money and capital markets as a whole in 1955 saw a marked narrowing between short-term and long-term rates. Moreover, pressures on the bond market in 1955 came not so much from a high volume of bond offerings as from the indirect consequences of restrictive federal reserve policy and tremendous demands for credit with which to buy houses and automobiles. The sharply rising stock market greatly narrowed the margin between common stock yields and bond yields.

Commercial Banks.—Total loans and investments of all commercial banks reached a new peak in the second half of 1955. These amounted to \$157,300,000,000 on Sept. 28, 1955. This increase in bank earning assets during 1955 was far less than during the previous year, however, as restrictive federal reserve policies forced commercial banks to sell government securities in an amount which almost equalled the substantial increase in loans and other securities. Total loans reached a new record peak of \$78,400,000,000 at the end of Sept. 1955, after a nine-month increase of \$7,800,000,000. Commercial bank holdings of government securities on Sept. 28, 1955, amounted to \$62,000,000,000, a decrease of \$7,000,000,000 since the beginning of the year. Other securities, chiefly holdings of state and local governments, stood at \$16,900,000,000 on Sept. 28.

On June 30, 1954, national banks, which numbered more than 4,700, held \$98,636,000,000 of total deposits. State banks, which numbered about 9,000, had total deposits of \$82,900,000,000. Total earnings of commercial banks in 1955 were well above the previous year, reflecting the expansion of loans and rising interest rates. Profits on securities sold were down sharply from 1954. Although current expenses increased, net current earnings were higher, as were dividends. Numerous bank mergers, involving some of the largest institutions, occurred during the year.

Money Supply.—The privately held money supply rose during the year to a new high. Nevertheless, federal reserve policies of credit restriction served in some degree to moderate the expansion.

The privately held money supply reached a new record peak on Sept. 30, 1955, at \$209,700,000,000, including demand deposits adjusted, \$104,900,000,000; time deposits at commercial banks, mutual savings banks, and the postal savings system, \$77,600,000,000; and currency outside banks, \$27,200,000,000. The increase over the figure of a year before was \$7,200,000,-

INPUT CONSOLE of ERMA (electronic recording machine-accounting), an automatic system for handling the bookkeeping details of 50,000 checking accounts a day, devised by the Stanford Research Institute, Menlo Park, Calif., for use by the Bank of America. Completed in 1955, the machine was composed of an electronic reading device, magnetic drum storage, magnetic recording tapes and a high-speed printer

ooo, with the rise in demand deposits somewhat exceeding that in time deposits. The usual seasonal movements influenced the behaviour of the money supply during the year. Thus, total deposits adjusted and currency outside banks rose \$7,200,000,000 during the last three months of 1954, declined \$4,400,000,000 in the first three months of 1955, and then rose \$4,400,000,000 during the next six months.

Money in circulation, that is, currency and coin outside the treasury and the federal reserve banks, showed little change during the first five months of 1955 from the previous year's figures. In May and June, however, there was a sharp upturn. Even so, money in circulation early in Nov. 1955 was barely equal to the peak amount for the same period reached late in 1953.

The volume of bank debits at commercial banks rose to new record heights, reflecting sharp recovery from slight recession and rapid further expansion in the economy. Debits to demand deposit accounts at banks in 343 leading centres in the third quarter of 1955 were 13.5% above the total reported for the corresponding period a year before. Moreover, the rise was unusually widespread, for all but 15 of these 343 individual cities had bank debits above the preceding year. The annual rate of turnover of demand deposits showed a further rise, with deposit velocity at the 343 reporting centres outside New York city being 9% above Sept. 1954. (J. K. L.)

Mutual Savings Banks.—Mutual savings banks in the United States had combined assets valued at \$30,460,827,273 at the close of business on June 30, 1955. On the same date there were funds on deposit in the amount of \$27,329,091,716 belonging to 20,872,628 depositors and surplus funds of \$2,796,733,474 equal to 10.2% of the amount due depositors.

During the year ended June 30, 1955, these combined assets increased by \$2,063,836,641 or 7.27% as compared with an

increase of \$1,995,209,245 or 7.58% for the year ended June 1954. The net increase in the combined amount due depositors was \$1,891,197,342 or 7.43% for the year ended June 30, 1955, and \$1,818,236,027 or 7.70% for the previous year; while the net increase in the number of depositors for the two 12-month periods was 349,451 or 1.70% in 1955 compared with 335,000 or 1.66% in 1954.

The number of mutual savings banks in the United States remained at 527 on Sept. 30, 1955. The incorporation of a new savings bank in Massachusetts, the Dukes County Savings Bank, was offset by the merger of two banks in Connecticut to form the People's Savings Bank-Bridgeport. The number of branches of banks in operation increased from 298 on Sept. 30, 1954 to 320 on Sept. 30, 1955.

On the average the dividend rate credited on deposits increased from 2.55% in 1954 to 2.71% in 1955. This was the highest average rate paid since 1935.

The rise in the dividend rate was supported by increased investments in real estate mortgage loans. The combined assets of mutual savings banks on June 30, 1955, were invested as follows: U.S. government securities 28.51%, other securities 13.71%, real estate mortgage loans 52.52% and miscellaneous assets 5.26%.

On June 30, 1954, the combined investments were distributed as follows: U.S. government securities 31.80%, other securities 14.39%, real estate mortgage loans 48.35% and other assets 5.46%. The existing level of mortgage investments was reached for the first time since 1933. The percentage of assets invested in U.S. government securities had not been as low as the existing figure since 1940.

During the year ended June 30, 1955, the growth of insurance in force was at the rate of 6.40% per annum in Massachusetts, 11.87% in New York and 19.37% in Connecticut. The varying rates were consistent with the length of time since life insurance had been available in the several states; viz.: in Massachusetts since 1908, in New York since 1939, in Connecticut since 1941.

The growth of balances due depositors in British Trustee Savings banks during the year ended Nov. 20, 1954, was £55,639,712, of which £48,853,126 represented the increase in balances in the special investment department. This large increase resulted from the more attractive rate of interest paid on deposits in this department and the increase in the limit of deposits allowed one individual from £500 to £1,000.

The number of active accounts in all three departments combined on Nov. 20, 1954, was 7,499,244, an increase of 450,000 for the year ended that date. There were 84 separate trust

Total funds	1,153,470,197	1,097,462,000

which was prompted by evidence of the re-emergence of inflationary pressures, was the most important development in the United Kingdom, the Commonwealth, Europe and the middle east in 1955. In nearly all countries the rising tempo of business activity was reflected in the growth of banking turnovers in the early months of the year and in a rise in the total of advances and deposits. But subsequently, following the adoption of more stringent official policies, an advance in interest rates and the tightening of quantitative restrictions on lending imposed a check on banking activity. In the later months of the year, therefore, the flow of bank money slowed down in many countries, while deposits and loans ceased to increase or turned downward.

The domestic finances of the banking systems benefited from the rising trend of money rates but they were naturally adversely affected in the later months of 1955 by the adverse impact of official stringency measures on the volume of bank business.

On balance, the current account circumstances of most banks were more favourable than in the preceding years, but many banks suffered severe capital losses because of the fall in the market value of their holdings of government and similar securities caused by the rise in the general level of money rates.

In Great Britain the authorities made the switch to dearer and tighter credit much earlier in 1955 than most other countries. In the first two months of the year the bank rate, which had been reduced from $3\frac{1}{2}\%$ to 3% in the second quarter of 1954, was raised by two stages to $4\frac{1}{2}\%$ to bring about a general rise in the level of interest rates in the United Kingdom and so discourage borrowing to finance capital development. To reinforce this effort to damp down the demand for credit, the authorities took steps to limit the ability of the banks to make new advances available. Official procedures for financing governmental borrowing and the treasury's open market operations in the London money market were reshaped so as to cut down the liquid resources at the disposal of the banking system until the banks could not expand nonliquid items like loans to private customers without infringing the traditional rule that they should maintain a ratio of liquid assets to deposits of at least 30%.

The use of orthodox controls for reversing the growth of bank loans was not, however, altogether successful. Demand for bank credit continued at a high level because of the need for additional business finance generated by the buoyancy of economic activity.

Rather than refuse customers' requests, many banks decided to provide this money by reducing other nonliquid assets, such as their holdings of government securities. This largely defeated the official attempt to curb lending by liquidity measures and in the first half of the year the loans of the London clearing banks (together responsible for about 95% of the commercial banking business of the U.K.) rose by almost £300,000,000 against a fall in security holdings of a little under this figure.

The government decided in the middle of the year to make a direct request to the banking system for a significant reduction in overdraft totals and the leading banks responded to this by indicating their intention to overhaul their agreements with customers with the object of bringing about a contraction of about a tenth in loan totals before the end of the year. Instructions were sent out to branch managers stressing that loan limits should be cut back as far as possible whenever this could be done without harming exports, the defense program, the production of import-saving goods and business activities of a normal seasonal kind and without causing unduly severe hardship. During the second half of the year, therefore, loans showed a falling trend.

Table III.—London Clearing Banks Returns
(£ million)

Item	Oct. 1953	Oct. 1954	Oct. 1955
Deposits	6,373	6,609	6,376
Net deposits	6,156	6,375	6,125
Cash	518	532	520
Call money	476	437	408

Commercial bills	53	83	115
Investments	2,238	2,364	2,086
Advances	1,654	1,824	1,965
Acceptances, etc.	310	375	459

At the end of October, however, the clearing banks' advances were still materially higher than a year before.

As loans to private customers declined in the second half of the year and as few banks were prepared, in view of the unsettled state of the gilt-edged market, to add to their holdings of government securities during this period, the ratio of the non-liquid assets of the banks to sight liabilities fell. The liquidity of the banks was further strengthened at this time by an increase in government borrowing on treasury bills caused by the need for the authorities to obtain bank money for covering its own budget deficit and for paying for bond issues of nationalized industries that it had to absorb because of the low level of private subscriptions.

The rise in the general level of interest rates caused the banks to step up the rate of interest paid on a substantial segment of their deposits during the year. But increased outlays on this account were materially outweighed by the rise in earnings. The change in the general monetary situation caused the banks domestic financial worry as there was a big fall in the market value of their substantial holdings of government securities.

This could not always be covered from the inner reserves set aside in earlier years to meet investment depreciation and a number of institutions reverted to the practice (first adopted in 1952) of showing investment portfolios in published balance-sheets at book values temporarily in excess of market values. (C. H. G. T.)

Baptist Church. From 60 countries 8,500 Baptists attended the jubilee congress of the Baptist World alliance, London, July 16-22, 1955. Numbering 6,000,000 in the world when organized in 1905, the alliance now represented 21,000,000.

Jacob I. Zhidkov, chairman of the All-Soviet Union of Evangelical Christians (Baptists), reported for his country 520,000 members (all 18 years or older), 5,400 churches, 3,000 ordained and 2,400 unordained ministers. The Moscow church had 4,500 members. There was no government interference with worship, he said, though no Sunday schools were permitted but religious education was permissible in the homes. No seminary existed because of lack of finances.

He claimed an 800% increase in membership of the church under the communist regime.

Authorities forbade the building or renting of Baptist church edifices in Spain during 1955 and closed some hitherto in use. Pastors and laymen were imprisoned on religious grounds, and *Echo of Truth*, a monthly publication, was suspended.

Baptists in Finland numbered 46,000, 14 churches being above the Arctic Circle. Baptists in Sweden in 1955 numbered 35,000 and supported 70 missionaries.

Hungarian Baptists reported 20,000 members, 50,000 adherents in 500 congregations, 100 ministers, 15 seminary students, and three homes for the aged.

One hundred and three churches represented in the 45th session of the Korean Baptist convention reported 1,980 baptisms, 25 new churches, 203 Sunday schools for 1954-55. Japanese Baptists dedicated a \$250,000, four-story, 100-bed hospital in Kyoto on July 12, 1955.

Baptist work in Thailand was resumed in 1955 after a lapse of some years, with eight missionaries supported by the two Foreign Mission societies of the American Baptist convention.

The fifth annual convention of the Bolivian Baptist union, held in 1955, recorded in that country 1,218 members, 33 churches, 12 national pastors, 55 Sunday schools, 2,738 pupils and 23 Vacation Bible schools attracting 1,280 children.

The Jamaica Baptist union in 1955 numbered 23,000 members, a gain of 1,000 over 1954.

The Ontario-Quebec Baptist convention, Canada, held June 13-16, 1955, reported that missionary contributions increased from \$180,000 in 1948 to \$360,000 in 1955; Church Extension campaign receipts amounted to \$294,000.

The American Baptist association meeting in Hot Springs, Ark., June 21-23, 1955, 3,500 attending, voted \$105,173.97 for missions, with 23 interstate and foreign missionaries. Sunday school publications netted \$169,798.97 during 1954-55. *The History of the Evangelical Churches of the Piedmont*, originally published 1658, was to be republished at a cost of \$5,000. J. W. Harper, Galatin, Tex., was elected president, and Little Rock, Ark., was chosen for the 1956 meeting.

Twelve hundred delegates at the Baptist General conference (Swedish) in Denver, Colo., June 22-26, 1955, appointed seven missionary couples to Japan, Ethiopia and South America. Eighty-seven missionaries, one for every 620 members, were in service during 1955. A missionary budget of \$400,000 was supported by 54,000 members in 427 churches.

Ten thousand messengers and visitors, representing 8,000,000 members, attended the Southern Baptist convention in Miami, Fla., May 18-21, 1955. C. C. Warren, Charlotte, N.C., was chosen president, and Kansas City, Mo., was selected for the 1956 meeting.

The American Baptist convention assembled in Atlantic City, N.J., in May with 6,698 attending. Frank A. Nelson, Racine, Wis., was elected president and Seattle, Wash., was selected for the 1956 gathering. (See also CHURCH MEMBERSHIP.)

(R. E. E. H.)

Barbados.

This British colony is the most easterly of the Caribbean islands. Area: 166 sq.mi. Pop.: (1946 census) 192,800 (77.27% Negro, 17.54% mixed, 5.11% European); (1954 est.) 223,000. Language: English. Religion: Christian (about 70% Anglican). Capital and chief port: Bridgetown, pop. (1954 est.) 18,000 (metropolitan area 80,000). Governor in 1955, Sir Robert Arundell; premier, Grantley H. Adams.

History.—Princess Margaret visited Barbados in Feb. 1955 during her West Indies tour. The Australian cricket team that toured the West Indies in the first half of the year beat Barbados in May by four wickets.

With assistance from the World Health organization, a campaign to eradicate the yellow fever mosquito and a campaign with the B-C-G vaccine to combat tuberculosis were initiated. Work was started on a 1,000-ft. extension of Seawell runway, making it 7,000 ft. long. Air France started a scheduled service linking the island with the French *départements* in the Caribbean. A housing authority to provide 600 houses a year for the working classes was set up under a housing act, and a development board to foster and develop local industry and agriculture was also established. The government assisted by loans the mechanization of the fishing fleet and plans were made to construct up-to-date refrigeration plant for fish. The government

joined the Caribbean Tourist association. A start was made carrying out a revised plan for a deep water harbour estimated to cost £3,500,000. Hurricane "Janet" caused great damage to Barbados on Sept. 22.

The coinage of the eastern Caribbean group went into circulation on Nov. 15.

(D. A. Ws.)

Education.—Schools (1953): public elementary 124, pupils 32, government-aided secondary 10, pupils 3,019. Higher education at King's College (affiliated to Durham university, Durham, Eng.), students 28 and Erdiston teachers' training college, students 32.

Finance and Trade.—Budget (1953-54 actual): revenue £3,107,660; expenditure £2,676,694; (1954-55 est.) revenue £2,848,372; expenditure £2,690,089. Foreign trade (1954): imports £10,100,000, exports £420,000. Principal exports: sugar, molasses, rum. Sugar crop (1954) 171,000 metric tons. Monetary unit: British West Indian dollar: B. \$1 = £1 sterling.

Barley.

The 1955 U.S. barley crop, indicated at 386,551,000 bu. and exceeded only by the 429,000,000-bu. crop of 1942, was moderately larger than the 370,126,000 bu. of 1954 and much larger than the 266,918,000-bu. average for 1944-53. Harvested acreage was 14,099,000 ac. as compared with 12,994,000 ac. in 1954 and an average for the 1944-53 decade of only 10,329,000 ac. The indicated average yield was 27.4 bu. per acre was favourable, compared with the 25.9-bu. average of 1944-53, but lower than the 28.5 bu. of 1954. Malted barley was comparatively scarce and test weights were low, the quality having been damaged in the northern plains area by hot weather at filling time as well as by green bugs and diseases. North Dakota climbed to first place as a producer (78,039,000 bu.), followed by the usual leader, California (61,005,000 bu.) and Montana (41,160,000 bu.). U.S. stocks carried over at the beginning of the crop year, July 1, were 130,000,000 bu., large as compared with 71,000,000 bu. in 1954 and 51,000,000 bu. in 1953. Imports from Canada were anticipated of about 20,000,000 bu. (average for 1949-53 was 21,000,000 bu.), giving a total supply for 1955-56 of 537,000,000 bu. as compared with 437,000,000 bu. in the previous year and a normal supply of about 350,000,000 bu. Market prices declined from about \$1.10 a bushel early in the year to less than 90 cents per bushel at harvest time. Official support price was reduced to 94 cents a bushel (70% of parity) at the farm as compared with \$1.05 (85% of parity) for the 1954 crop.

Barley in recent years has displaced corn as the most important feed grain moving in world trade—about 5,007,000 tons (equivalent to 223,645,000 bu.) entered world trade in 1954-55 as compared with 5,800,000 tons in the previous year. Carry-over stocks in the four principal exporting countries—U.S., Canada, U.K. and Germany—were exceeded by the 262,000,000 bu. of 1954. A large world crop estimated at 2,830,000,000 bu. augmented the large carry-over.

(J. K. R.)

Barley Production of the Principal Producing Countries

Country	(In thousands of bushels)		Average 1945-49	Average 1950-54

*Preliminary estimate.

Baseball.

Brooklyn's frustrating search for a world baseball championship ended in 1955. That, in cap form, was the story of the major league season. In effect, all drama, the turbulence, the joy and the heartbreak of an entire baseball year were blended into a single game. That was

seventh and deciding struggle of the world series, and the Dodgers won it. They beat their neighbouring rivals, the New York Yankees, 2 to 0, after splitting the first six games. Further embellishing the Brooklyn triumph was the fact that the Dodgers captured the series despite the loss of the first two games. No other team in modern annals had overcome an obstacle of that magnitude. Brooklyn thus was rewarded following seven previous fruitless series appearances.

Meanwhile, baseball in 1955 found Kansas City meeting the challenge of its newly-acquired major league franchise. The transplanted Athletics attracted 1,393,054 customers at home, a figure in excess of 1,000,000 over that drawn by the last-place Athletics at Philadelphia in 1954. Kansas City finished a respectable sixth in its American league debut.

Baseball lost one of its pillars with the death of 85-year-old Clark Griffith, owner of the Washington Senators, on Oct. 27. Eight days later, Denton True (Cy) Young, baseball's winningest pitcher, died at the age of 88. Griffith's son, Calvin, was named to carry on as president of the Senators.

Major League Races.—The major league pennant races represented two exaggerated extremes. The New York Yankees waited until two days before the season terminated to emerge from one of the most exhausting American league fights in years. Conversely, Brooklyn ran away from the pack in the National league.

The Yankees brought Manager Casey Stengel his sixth pennant in seven years, but the issue was in doubt among four teams almost until the end. New York wound up three games in front of the Cleveland Indians and five ahead of the Chicago White Sox. The Boston Red Sox made an exciting bid but faltered in the stretch to settle in fourth place, 12 games back.

UMPIRE BILL SUMMERS signalling Pee Wee Reese (1) of the Dodgers safe at first base as pitcher Johnny Kucks (53) of the Yankees arrives too late to tag out Reese. Joe Collins, Yankee first baseman who fielded the ball, is shown at the left. The action occurred at Ebbets field, Brooklyn, N.Y., during the fourth game of the 1955 world series, Oct. 1

Detroit stayed within reach until midway through the season but dropped to fifth in the final standing.

Moreover, the Yanks got a superlative comeback from 35-year-old pitcher Tommy Byrne, who left his wildness in the minor leagues and came on to compile a 16 and 5 record. Whitey Ford showed 18 and 7 on the mound to parlay a potent one-two southpaw pitching punch for New York. As usual, the Yankees outstripped the rest of the league in home runs, with 175. Switch-hitting centrefielder Mickey Mantle delivered a league-leading total of 37.

In the National league, Brooklyn opened the season with a record ten straight victories and ultimately won 21 of its first 23 games. Thereafter, Manager Walter Alston's club remained in control. The Dodgers formally clinched the pennant on September 8 in their 138th game, the earliest in modern major league history. The battle for second place provided a scramble, with the Milwaukee Braves finally shaking off the 1954 world champion New York Giants. The Braves were 13½ games behind Brooklyn at the end. The Giants, in third, finished 18½ games from the top. Philadelphia was fourth, 21½ games out.

An ironic twist in Brooklyn's fortunes came on May 5 when Manager Alston suspended pitcher Don Newcombe briefly for refusal to pitch batting practice. Once reinstated, Newcombe proceeded to win a club high of 20 games against 5 losses. His bat was also a factor, with a .359 average featured by seven home runs and 23 runs batted in. The Dodgers boasted three regulars in the charmed .300 hitting circle. Catcher Roy Campanella hit .318, rightfielder Carl Furillo .314 and centrefielder Duke Snider .309. Brooklyn led the major leagues in home runs with 201, including 42 by Snider.

World Series.—Johnny Podres won the 1955 world series for Brooklyn. He didn't do it singlehandedly, for baseball subscribes to the team theory. But he was the primary difference between the Dodgers and a Yankee club which previously had plucked off 16 series championships as compared with only four

Table I.—Final Major League Standings, 1955

reversals.

With the series tied at three games apiece, Podres, a 23-year-old-lefthander, shut out the Yankees, 2 to 0, in the climactic seventh game. He scattered eight hits to beat Tommy Byrne and he did it in Yankee stadium. Gil Hodges batted home both Dodger runs, one with a single in the fourth inning, the other with his sacrifice fly in the sixth.

Earlier, New York had threatened a possible sweep. The Yanks opened the postseason classic by beating Don Newcombe, 6 to 5, behind Whitey Ford. Two home runs by Joe Collins, good for three runs, settled the game.

New York took the second game, too, as Tommy Byrne stopped the Dodgers on five hits and singled in two decisive runs during a four-run Yankee fourth inning.

Now trailing by two games, with both losses effected at Yankee stadium, Brooklyn found a haven of refuge in its Ebbets field home and a stopper in Podres. He shackled the Yanks on a seven-hitter and Brooklyn bats responded with an 8 to 3 victory.

Given new life the Dodgers tied the series at two games all, 8 to 5. Brooklyn grabbed the lead on home runs by Roy Campanella and Hodges, and clinched matters when Duke Snider homered with two on in the fifth inning. Clem Labine, in relief of starter Carl Erskine, gained credit for the win.

Brooklyn pulled out ahead in the series by virtue of a 5 to 3 victory in the fifth game, their third in a row at Ebbets field. Snider smashed two home runs to run his lifetime series total to 9, a record for the National league. His homers benefited rookie Roger Craig, who became the winning pitcher.

Back at Yankee stadium, the Yanks squared the series. Ford came back for his second win, this time by a 5 to 1 margin on a four-hitter. New York broke it up with five runs in the first inning, three on a home run by Bill Skowron.

That forced the world series to the limit and Podres then reigned supreme.

Individually, catcher Yogi Berra of the Yankees led series regulars at bat with a .417 average. The irrepressible Snider finished with .320, including four home runs and seven runs batted in. The Yankees' Mickey Mantle saw action in only three games because of a leg injury.

Yankee shortstop Phil Rizzuto played in all seven games to run his lifetime total of appearances in series games to 52, a new record. Joe DiMaggio had held the previous standard of 51.

Total paid attendance at the series was 362,310, with net receipts therefrom totalling \$2,337,515.34 Brooklyn players received \$9,768.21 apiece for a full share, the Yankees \$5,598.58.

Individual Performances.—Al Kaline of Detroit, only two years removed from the high school ranks, won the 1955 American league batting championship, posting an average of .340 in final unofficial averages. The 20-year-old Kaline also led the league in hits with 200. Ted Williams of Boston, rejoining the Red Sox belatedly after reconsidering plans to retire, hit .350 but came to bat only 320 times, 80 less than the required number to qualify for the title. Boston's Jackie Jensen and Detroit's Ray Boone tied for runs-batted-in honours with 116. Mickey Vernon of the Yankees produced 37 home runs and 11 triples for leadership in both departments. Harvey Kuenn of the Tigers led in doubles with 38. The stolen base title went to Jim Rivero of the Chicago White Sox. He had 25.

In pitching, lefthander Billy Pierce of Chicago turned in the top earned-run average of 1.97. The league had no 20-game winners. Boston's Frank Sullivan, New York's Whitey Ford and Cleveland's Bob Lemon each won 18. Herb Score, the highly publicized Indians' rookie, struck out 244 to head the circuit and set a new record for a first-year man.

Harry Agganis, a first baseman with the Red Sox, died unexpectedly during the season following an illness.

In the National league, Richie Ashburn, fleet centrefielder of the Philadelphia Phillies, captured the batting championship on the strength of a .338 average. Willie Mays of the New York Giants slammed 51 home runs to win the long-distance crown as the National league boasted six players with 40 or more home runs for the second straight year. Ernie Banks, the spectacular shortstop of the Chicago Cubs, broke two major league records. He hit 44 home runs, the most ever by a shortstop, and became the first player to get five grand-slam homers in one season. Ted Kluszewski of Cincinnati collected the most hits, 191, and Brooklyn's Duke Snider topped the runs-batted-in category.

Table III.—Final Minor League Winners, 1955

Class	League	Finished first	Parent club	Won play-offs	Position	Parent club
Open	Pacific Coast league	Seattle	Independent	No play-offs		
AAA	American association	Minneapolis	New York N.L.	Minneapolis	1	New York N.L.

	Sooner State league	Lawton	Milwaukee	Lawton	1	Milwaukee

*Won both halves of split season. †Eugene, Spartanburg and Fresno each won second-half titles and defeated Salem, Greenville and Stockton, respective first-half winners, in play-offs. ‡New Iberia won first-half, then Lafayette won second-half and four-team play-off. §Paducah awarded play-off title when three other first-division finishers declined to play post-season series.

Source: *Sporting News*, the national baseball weekly.

DON NEWCOMBE of the Brooklyn Dodgers preparing to pitch to Gene Baker of the Chicago Cubs. Newcombe won 20 games in 1955. The photographic technique makes Newcombe appear to be closer to the batter than the regulation distance

with 136. Mays and Dale Long of Pittsburgh each were credited with 13 triples, while Hank Aaron and Johnny Logan, both of Milwaukee, hit 37 doubles apiece. Bill Bruton, also of the Braves, stole 25 bases.

In pitching, Bob Friend of Pittsburgh won the earned-run leadership with 2.84 despite the Pirates' eighth-place finish. Robin Roberts of the Phillies ran up 23 wins against 14 losses for six 20-game seasons in succession, and Brooklyn's Don Newcombe had 20 and 5. Sam Jones of the Cubs registered the only no-hit, no-run game of the season on May 12 at Wrigley field in Chicago, beating Pittsburgh, 4 to 0. Jones also paced the league in strikeouts with 197.

All Star Game.—The 22nd annual All Star baseball game July 12, at Milwaukee took 12 innings before the National league beat the American league, 6 to 5. A home run by Stan Musial of the St. Louis Cardinals finally broke a 5 to 5 deadlock in the Nationals' favour. Musial's homer was delivered off Boston's Frank Sullivan, the loser, and brought Milwaukee's Gene Conley the triumph in his home park. The attendance was 45,314. It was the National league's ninth All Star victory against 13 losses. Arch Ward, sports editor of the *Chicago Tribune*, who had innovated the All Star game in 1933, died three days before the 1955 classic unfolded.

Managerial Changes.—The St. Louis Cardinals effected the only managerial change during the course of the regular season. The Cardinals released Eddie Stanky on May 29 and replaced him with Harry Walker, who had been managing their Rochester, N.Y., affiliate. The Cardinals underwent a major shake-up after the season ended. Frank Lane, who had resigned as general manager of the Chicago White Sox on Sept. 23, was signed to a similar post with the Cards. Lane then hired Freddie

Hutchinson, former Detroit manager, to succeed Walker as field manager. Leo Durocher, manager of the world champion New York Giants in 1954, resigned following the 1955 campaign and the Giants' reins were turned over to Bill Rigney, called up from a managerial post at Minneapolis. Durocher left baseball in the wake of a long and colourful career to become a television executive. The Pittsburgh Pirates released field manager Fred Haney upon the conclusion of the season and later announced a front office change as well with the retirement of the veteran Branch Rickey. Joe L. Brown, son of comedian Joe E. Brown, was named successor to Rickey as general manager, and Brown selected Bobby Bragan, manager at Hollywood, to lead the Pirates as field manager.

Player Deals.—Two of the major trades happened after the 1955 season was over. The Chicago White Sox, seeking a power-hitter, got centrefielder Larry Doby from Cleveland. Chicago, in turn, sent shortstop Chico Carrasquel and centrefielder Jim Busby to the Indians. The White Sox had secured Busby from Washington in June in return for centrefielder Johnny Groth, catcher Clint Courtney and pitcher Bob Chakales. On Nov. 9, Washington negotiated a nine-man deal with the Boston Red Sox. The Senators gave up pitchers Bob Porterfield and Johnny Schmitz, first baseman Mickey Vernon and outfielder Tommy Umphlett for pitchers Dick Brodowski, Al Curtis and Truman Cleveland and outfielders Karl Olson and Neil Chrisley.

Another key trade unfolded long before the season began. On Nov. 17, 1954, the New York Yankees and Baltimore Orioles pulled a nine-player swap. The Yanks received pitchers Bob Turley and Don Larsen, along with shortstop Billy Hunter, in exchange for pitchers Harry Byrd and Jim McDonald, outfielder Gene Woodling, shortstop Willie Miranda, first baseman-catcher Gus Triandos and catcher Hal Smith. Six men were involved in a trade between Cincinnati and the Philadelphia Phillies on April 30. Cincinnati gave up outfielders Jim Greengrass and Glen Gorbous and catcher Andy Seminick for pitcher Steve Ridzik, catcher Smoky Burgess and outfielder Stan Palys. Late in July, two prominent pitchers changed uniforms when the Yanks sold Eddie Lopat to Baltimore and the New York Giants sold Sal Maglie to Cleveland.

Hall of Fame.—Six famous baseball players won election to the Hall of Fame at Cooperstown, N.Y. The group included Ray (Cracker) Schalk, Chicago White Sox catcher-manager, and John Franklin (Home Run) Baker, third baseman for the Philadelphia Athletics and New York Yankees, both of whom starred more than a quarter-century ago. Players of more recent vintage honoured were Joe DiMaggio, Yankee centrefielder; Ted Lyons, White Sox pitcher; Arthur (Dazzy) Vance, Brooklyn pitcher, and Leo (Gabby) Hartnett, Chicago Cubs' catcher-manager.

Attendance.—As a result of its close pennant fight, the American league outdrew the National league in attendance. American league teams registered 8,943,516 patrons as compared with 7,672,795 for the National. The American league showed an increase of 1,021,151 over 1954, while the National league was down by 340,724. Milwaukee, however, passed the 2,000,000 mark for the second year in a row. The aggregate of 16,616,311 for the two leagues reflected an over-all increase of 680,427, or 4.27%, over the previous year.

The Minor Leagues.—Table III reveals the pennant and play-off winners in the minor baseball leagues during 1955.

(J. BE.)

Boys' Baseball.—Morrisville, Pa., gained the 1955 Little league title by halting the Delaware township (N.J.) nine, 4-3, in the final of the circuit's world series at Williamsport, Pa., on Aug. 26. A home run by Rich Cominski in the seventh decided the contest between rivals of towns located only 35 mi. apart. Auburn, Ala., defeated Winchester, Mass., 1-0, in the consol-

NARROW CATCHER'S BOX, a 1955 major league baseball rule change designed to discourage the intentional base on balls. Under the new rule the catcher was required to remain within the box until after the pitch. The possibilities for the offensive team were indicated in a game in May in which a batter swung at what was intended to be ball four and hit a single to left field

tion play-off for third place. Little league baseball was introduced in England in 1955 by U.S. airmen and caught the fancy of lads under 13 years of age who soon were beating the sons of G.I.'s at their own game.

The Babe Ruth league, with 24 new groups added to its ranks, had a banner season climaxed by its world series at Austin, Tex., in August. Terre Haute, Ind., won the crown when it conquered Birmingham, Ala., 6-4, in the finale. Stamford, Conn., winner for the previous three straight years, was eliminated in the first round when it bowed to Terre Haute, 3-2.

The title in the Pony (Protect Our Nation's Youth) league was won by Washington, Pa., which blanked Youngstown, O., 4-0, in the final of the tourney at Washington, Pa. Beatrice, Neb., won the National teeners' tourney at Hershey, Pa., when it routed Johnston, R.I., 8-1. Cincinnati defeated Washington, D.C., 10-4, to gain the American Legion junior title at St. Paul, Minn.

College Baseball.—Wake Forest set back Western Michigan, 7-6, at Omaha, Neb., on June 16 to take the National Collegiate Athletic association title. Tom Borland of the Oklahoma Aggies won honours as the tournament's outstanding pitcher.

Other major college champions of 1955 included the following:

Eastern (Ivy)—Yale	Illinois—Millikin
Southeast—Alabama	Midwest—Coe
Southern—West Virginia	Mason-Dixon—Randolph Macon
Atlantic Coast—Wake Forest	Mountain States—Wyoming
Western (Big Ten)—Ohio State	Border—Arizona
Indiana—Valparaiso	Pacific Coast—So. California
Interstate—Illinois Normal	Big Seven—Oklahoma
Mid-American—Ohio University	Southwest—Texas A. & M.
Missouri Valley—Oklahoma A. & M., St. Louis, tie	(T. V. H.)

Basketball.

The University of San Francisco Dons dethroned La Salle college (Philadelphia, Pa.) as National Collegiate Athletic association ruler by defeating the

defending champions, 77-63, at Kansas City on March 19, 1955. Paced by Bill Russell, 6 ft. 10 in. All America centre, the Californians took a 36-24 half-time lead and never were overtaken in the N.C.A.A. final. It was the Dons' 26th straight victory. Colorado, the Big Seven conference champion, scored a surprise in the consolation contest when it upset Iowa, the Western conference title winner, 75-54. Results of the regional finals were: Colorado 93, Bradley 81; Iowa 86, Marquette 81; La Salle 93, Canisius 64; San Francisco 57, Oregon State 56. The first five ranking college teams in the final Associated Press poll were in order: San Francisco, Kentucky, La Salle, North Carolina State and Iowa. The United Press poll listed San Francisco, Kentucky, La Salle, Utah and Iowa, in that order.

Georgia Tech (Atlanta) provided two of the major upsets of the 1954-55 campaign. The Engineers stopped powerful Kentucky (Lexington), 59-58, at Lexington, Ky., on Jan. 8. When Joe Helms tallied on a jump shot in the last 11 sec. he snapped a 32-game winning streak compiled by Kentucky, and it marked the first time the Wildcats had lost on their home court in 13 contests. Tech scored another amazing victory on Jan. 31 when it set back Kentucky, 65-59, at Atlanta.

The University of Duquesne (Pittsburgh, Pa.) won honour in the 18th annual national intercollegiate invitation tournament at New York's Madison Square Garden. Duquesne halted Dayton (O.), 70-58, in the final on March 19. The University of Cincinnati (O.) downed St. Francis (Loretto, Pa.), 96-91, in the consolation battle. The East Texas State (Commerce, Tex.) five carried home the top prize of the 17th annual national intercollegiate (N.A.I.A.) competition at Kansas City by beating Southeastern (Durant, Okla.), 71-54, on March 13. Moberly Missouri took national junior college laurels with a 71-64 decision over Hannibal-LaGrange of Missouri on March 13.

The East's All-Stars beat the West, 83-68, in Madison Square Garden as 18,135 spectators looked on. The contest was for the benefit of the *New York Herald-Tribune* Fresh Air fund.

In the Ivy league, Columbia, Princeton and Pennsylvania finished in a three-way tie with ten victories and four losses each. In the first play-off, at Princeton, N.J., Columbia eliminated Penn, 73-71. However, Princeton, in its meeting with Columbia at Rutgers in New Brunswick, N.J., routed the Lions, 86-60, to take the title.

Among the major college champions of 1955 were the following:

Eastern (Ivy)—Princeton (Princeton, N.J.)
Southeastern—Kentucky (Lexington, Ky.)
Southern—West Virginia (Morgantown, W.Va.)
Atlantic—North Carolina State (Raleigh, N.C.)
Western (Big Ten)—Iowa (Iowa City, Ia.)
Big Seven—Colorado (Boulder, Colo.)
Missouri Valley—St. Louis (St. Louis, Mo.) and Tulsa (Tulsa, Okla.), tied
Mid-American—Miami (Oxford, O.)
Midwestern—Cornell (Mt. Vernon, Ia.)
Interstate—Western Illinois (Macomb, Ill.)
Illinois collegiate—Millikin (Decatur, Ill.)
Indiana collegiate—Evansville (Evansville, Ind.)
Mountain States (Skyline)—Utah (Salt Lake City, U.)
Border-Texas Tech (Lubbock, Tex.) and West Texas State (Canyon, Tex.), tied
Pacific Coast—Oregon State (Corvallis, Ore.)
Southwest—Southern Methodist (Dallas, Tex.)
Rocky Mountain—Idaho State (Pocatello, Ida.)

Amateur Athletic Union Basketball.—The 48th Amateur Athletic union championship for men, held at Denver, Colo., March 21-26, attracted 25 teams. The Phillips 66 Oilers of Bartlesville, Okla., carried home the trophy by halting the Lockett-Nix quintet of Boulder, Colo., 66-64, in the final. The Olympic club gained third place by halting the Quantico (Va.) Marines, 78-69, in the consolation contest. The Peoria (Ill.) Diesel Caterpillars, who had won the top prize three straight years and the world amateur crown late in 1954, were eliminated by the Lockett-Nix team, 70-67, in a quarter-final upset. Earlier in the campaign the Phillips quintet had won National

Industrial league honours for the seventh time. The Wayland college club of Plainview, Tex., retained the title in the women's 27th national tourney at St. Joseph, Mo. The defenders defeated the Commercial Extension Comets of Omaha, Neb., 30-21, in the last round.

Professional Basketball.—The Syracuse (N.Y.) Nationals, Eastern division champions, won the National Basketball association championship by subduing the Ft. Wayne (Ind.) Pistons, in the final play-off series. Play-off results follow:

Eastern semifinals
Boston 122, New York 101
New York 102, Boston 95
Boston 116, New York 109

Eastern finals
Syracuse 110, Boston 100
Syracuse 116, Boston 110
Boston 100, Syracuse 97
Syracuse 110, Boston 94

Western semifinals
Minneapolis 82, Rochester 78
Rochester 94, Minneapolis 92
Minneapolis 119, Rochester 110

Western finals
Fort Wayne 96, Minneapolis 79
Fort Wayne 98, Minneapolis 97
Minneapolis 99, Fort Wayne 91
Fort Wayne 105, Minneapolis 96

Syracuse 86, Fort Wayne 82
Syracuse 87, Fort Wayne 84
Fort Wayne 96, Syracuse 89
Fort Wayne 109, Syracuse 102

All-Championship finals
Fort Wayne 74, Syracuse 71
Syracuse 109, Fort Wayne 104
Syracuse 92, Fort Wayne 91
Syracuse wins, 4 games to 3

Boston's Bill Sharman and Bob Cousy led the East to a 100-91 decision over the West in the annual professional All-Star game played at Madison Square Garden. The Harlem Globetrotters on their annual spring cross-country tour with the College All-Stars won the 24-game series by 14 to 10. (T. V. H.)

Belgian Colonial Empire. The Belgian colonial empire consists of the colony of the Belgian Congo in central Africa and the adjacent trust territories of Ruanda-Urundi administered with the Congo. Total area: 925,733 sq.mi. Total pop. (1954 est.): 16,674,860. Areas, populations, capital towns, status and governors of the separate territories are given in the table.

Belgian Colonial Empire					
Country	Area (In sq. mi.)	Population (1954 est.)	Capital	Status	Governor
Belgian Congo	904,991	Africans 12,317,300 Europeans 86,688 (incl. 67,827 Belgians)	Léopoldville	Colony	Léo Pétillon, governor general
Ruanda-Urundi	20,742	Africans 4,261,900 Europeans 5,559 (incl. 4,110 Belgians) Others 3,413	Usumbura*	{Sultanates, trust terri- tories}	Claeys-Bouvaert, governor

*Principal town of Ruanda, Kigali; principal town of Urundi, Kitega.

History.—In May-June 1955 King Baudouin paid an official visit to the Belgian Congo. He addressed at Léopoldville a crowd of about 100,000 people, most of them Africans, speaking in French and Flemish (the official languages of Belgium) and in Lingala, the local language. He emphasized the efforts made in the field of education and social welfare and announced further reforms to the benefit of the inland population. The great sympathy with Africans shown by the king and the spontaneous enthusiasm of the population strengthened the position of the Belgian crown in the Congo and improved the relations between black and white.

At Kimuenza, near Léopoldville, the first university for students of both races was opened under the name of Lovanium after its parent University of Louvain (Belgium). The Congo and the trust territories Ruanda-Urundi were the world's second largest supplier of copper and by far the largest supplier of cobalt. It exported large quantities of uranium, tin, manganese and other minerals, besides palm oil, cotton and coffee. In 1954

UP FOR THE REBOUND go LaSalle and Duquesne basketball players during the finals of a tournament at Madison Square Garden, New York city, in Jan. 1955. Duquesne did not make a single substitution in the game, as they beat LaSalle 67-65 despite Tom Gola's 30 points for the losers

26.4% of the Congo's exports went to the United States, 23.7% to Belgium, 12.2% to France, 11.1% to the German Federal Republic, and 8.4% to Great Britain. The ten-year plan for economic development went on and it was stated that by 1955 investments amounted to \$403,338,000. When completed in 1959 the plan would have cost about \$965,560,000.

In September the gauge of the Kindu-Kabalo-Albertville railway was altered from 3 ft. 3 in. to 3 ft. 6 in. All but two small lines had now the same gauge and when the new line between Kabalo and Kamina was finished all centres of economic and strategic importance would have access by railway to the Atlantic ocean and Indian ocean. (M. H. Sr.)

Finance.—Monetary unit: Congolese franc, nominally an independent currency, actually at par with the Belgian franc. *Congo*. Budget (1955): (ordinary) revenue 8,710,281,000 fr., expenditure 8,425,216,000 fr.; (extraordinary) revenue 178,610,000 fr.; expenditure 10,559,304,000 fr. *Ruanda-Urundi*. Budget (1955): (ordinary) revenue 730,683,000 fr., expenditure 759,233,000 fr.; (extraordinary) receipts and expenditure 405,403,000 fr.

Foreign Trade.—(1954) Imports 18,076,698,367 fr.; exports 20,224,664,590 fr.

Transport and Communications.—*Congo and Ruanda-Urundi*. Roads (1952): 128,253 km. Motor vehicles in use (*Congo*, 1953): cars 20,000, commercial vehicles 22,300. Railways (1954): 4,634 km. Waterways (1954): 13,047 km.

Agriculture.—Principal products (*Congo*, metric tons, 1953): palm oil (exports) 132,000; palm kernels (exports) 88,000; cottonseed (incl. *Ruanda-Urundi*) 91,000, rubber (1954) 22,550; logs (cu.m.) 755,887; sawn wood 254,141; pitwood 2,069,991; cotton, lint 50,000; coffee 30,901; peanuts 180,000; cassava (*Congo*) 6,751,000, (*Ruanda-Urundi*, 1954) 2,040,000.

Mineral Production.—*Congo and Ruanda-Urundi*. (metric tons, 1953; 1954 in parentheses): copper (smelter, *Congo*) 214,100 (226,760); tin concentrates (metal content) 15,480 (13,090); cobalt (alloys) 9,020

(six months, 5,048), (granulated) 4,387 (six months, 2,839); manganese ore (*Congo*) 108,300; tungsten ore 762; zinc (exports, *Congo*) 125,800 (71,030 smelter); coal (*Congo*) 315,000; gold 11,540 kg.; diamonds (*Congo*) 12,580,300 metric carats; silver 154 metric tons.

Belgian Congo: *see* BELGIAN COLONIAL EMPIRE.

Belgium. A kingdom of western Europe, Belgium is bounded southwest by France, north by the Netherlands and east by Germany and Luxembourg. Area: 11,779 sq.mi. Pop.: (1947 census) 8,512,195; (1954 est.) 8,840,700. Language (1954 est.): Flemish (Dutch) 50%, French 34%, Flemish and French 15%, German 1%. Religion: mainly Roman Catholic. Chief towns (pop., 1952 est.; commune only): Brussels (cap.) 180,771; Antwerp 261,405; Ghent 164,713; Liège 156,728; Schaerbeek 122,172; Ixelles 92,298; Anderlecht 88,326. Ruler, King Baudouin I; prime minister in 1955, Achille van Acker.

History.—In May 1955 King Baudouin opened at the Army museum in Brussels a collection of exhibits relating to the military career of his father, King Leopold III, and thanked Antoon Spinoy, the Socialist minister of defense, for his statement that history had recognized that the Belgian army under Leopold's command in May 1940 did its duty both to the Allies and to the nation. King Baudouin received an extremely warm welcome on his return from visiting the Belgian Congo. On the 125th anniversary of the Belgian independence the king laid the first stone of the 1958 Brussels World exhibition. Prince Albert, brother of the king, made a study trip to the United States.

On Jan. 21, the chamber of deputies ratified by 181 votes to 9 with 2 abstentions the four protocols affecting Belgium contained in the Paris agreements on western defense. In the senate the bill passed on April 6 by 142 votes to 2 with 1 abstention.

At the conference at Messina, Sicily, of the ministers of the six member countries of the European Coal and Steel Community, the foreign ministers of Benelux (Belgium, the Netherlands and Luxembourg) introduced proposals for (1) integration of transport and power, including the industrial use of atomic energy; (2) general economic integration through the creation of a common market, by gradual repeal of quotas and customs; and (3) equalization of social security systems. It was decided that experts under chairmanship of Paul-Henri Spaak, the Belgian foreign minister, should prepare a new conference on further integration. The experts of the six member countries and of Great Britain, which had accepted a form of association with the European Coal and Steel Community, worked in Brussels from July to October after which Spaak drafted a report on the proceedings and proposals.

On June 20, the text of the U.S.-Belgian agreement for co-operation on the civil uses of atomic energy was published. The agreement provided that the existing commercial contracts between the U.S.-British combined agency and the African Metals corporation acting for the Union Minière du Haut-Katanga, the company in charge of uranium mining at Shinkolobwe (Belgian Congo), should remain in force until the date of expiration. It was further agreed that Belgium would keep 90% of its uranium production at the disposal of the agency in 1956 and 1957, and 75% during the three following years. In the autumn the filling of the first Belgian 1,000-kw. reactor with ten tons of graphite and uranium began at the centre for nuclear research at Mol-Donk, in the province of Antwerp, and it was announced that a second 10,000-kw. reactor would be built in Belgium for producing electricity for the 1958 Brussels World exhibition.

By encouraging industry and allowing local authorities to enrol unemployed workers the government further reduced unemployment. The ordinary budget for 1956, introduced by Henri Liebaert, the minister of finance, was balanced and the deficit of

the extraordinary budget was less than in 1954 and 1955 when it reached 20,200,000,000 fr. and 17,259,000,000 fr., respectively.

During the year the Socialist-Liberal coalition government had to face fierce attacks from the Christian Social opposition because of the education act, which was passed by a majority. For months there were demonstrations, riots and even a school strike. The Roman Catholic bishops issued a solemn protest against the bill on secondary and vocational schools which they called morally harmful. The bill recognized the right of the state to open official secondary and technical schools when and where the need was felt. The so-called "free" schools, which were mainly Roman Catholic, would remain subsidized by the state, the provinces and municipalities but the total amount would not exceed the subsidies granted in 1953 and 1954 when the Christian Social party was in power. The teachers would have to possess the requested certificates and in that case they would be paid by the state on an equal basis as teachers of official schools.

Another controversy occurred when Léon Elie Troclet, the minister of labour and social security, decided to reform the health insurance scheme despite the protest of the Medical federation. Half of the Belgian population was subject to the law on social security. Under the previous system contribution paid by the workers and employers were handed to the National Sickness and Disability Insurance federation which distributed them among the Christian Social, Socialist, Liberal and neutral sick funds in proportion to the number of their members. The workers included in the scheme had the free choice of a doctor who was paid by the patient. The doctor filled in a form stating the kind of consultations (at the surgery, at home or at night) and their number, and the member received a fixed sum from his fund. The new system, entering into force on Jan. 1, 1956, compelled the members to buy tickets from their fund, paying 10 fr. (20 U.S. cents). They were required to hand the doctor a ticket for each visit, and were not allowed to make any other payment. The doctor was to be paid the rate applicable in his district, which might be 40 fr. (80 U.S. cents). The patient had free choice among the doctors accepting the system. If the patient consulted another doctor they had to pay him themselves. The Medical federation was of the opinion that the new system interfered with the direct relations between doctor and patient and with professional ethics because a medical council would control the doctors. The government, therefore, appointed a committee of six ministers to meet the doctor's representatives and discuss a solution.

During the second half of the year social unrest developed as a result of claims for higher wages and for the introduction of a 45-hr. five-day week in industry. The two main concerns of the Belgian iron and steel industry, the John Cockerill and Ougrée-Marihaye companies, decided to merge into the Cockerill-Ougrée company including the sheet iron company "Féblatil." (*See also* EUROPEAN UNITY.) (M. H. St.)

Education.—Schools (1952): primary 8,697, pupils 835,648; secondary 774, pupils 140,047; vocational (post-primary) 1,513, pupils 176,766; teachers' training colleges (post-primary) 159, students 19,636. Universities (1952) 4; other institutions of higher (post-secondary) education 19; students (total) 21,944.

Finance and Banking.—Monetary unit: Belgian franc, with an average exchange rate of 140 to the £ sterling and 50.14 to the U.S. dollar. Budget (1954 est.; 1955 est. in parentheses): revenue 78,700,000,000 fr. (81,730,000,000 fr.); expenditure 99,685,000,000 fr. (98,989,000,000 fr.). Internal debt (1953; 1954 in parentheses) 260,241,000,000 fr. (246,544,000,000 fr.); external debt 21,688,000,000 fr. Gold and foreign exchange holdings (U.S. dollars, 1954; Apr. 1955 in parentheses): U.S. \$1,046,000,000 (\$1,114,000,000). Currency circulation (Jan. 1955; Sept. 1954 in parentheses): 105,800,000,000 fr. (105,200,000,000 fr.). Bank deposits (Jan. 1955; Sept. 1954 in parentheses): 75,000,000,000 fr. (70,000,000,000 fr.).

Foreign Trade.—(Belgium-Luxembourg economic union, 1954). Imports 126,300,000,000 fr.; exports 114,100,000,000 fr. Main sources of imports: Germany 17,400,000,000 fr.; Netherlands 17,100,000,000 fr.; France 13,300,000,000 fr.; United States 13,100,000,000 fr.; U.K. 10,700,000,000 fr.

fr. Main destination of exports: Netherlands 24,100,000,000 fr.; France and western Germany 11,100,000,000 fr.; United States 9,200,000,000 fr.; U.K. 7,200,000,000 fr.

Transport and Communications.—Roads (1953): 62,700 km. Motor vehicles in use (1952): cars 320,000, commercial vehicles 150,000. Railways (1954) 7,923 km.; passenger-km. (S.N.C.B. only, 1953) 7,528,000,000; freight, ton-km. (S.N.C.B. only, 1954) 5,634,000,000. Shipping: merchant vessels of 100 gross tons and over (July 1954): 204; total tonnage 497,998. Navigable inland waterways (1955): 1,568 km. Air transport (1954): passenger-km. 489,309,000; cargo, ton-km. 22,788,000. Telephones (Jan. 1954): 777,340. Radio receiving sets (1953): 1,863,000.

Agriculture and Fisheries.—Main crops (metric tons, 1954): wheat 589,000; barley 218,000; oats 452,000; rye 245,000; potatoes 2,634,000; beet sugar (raw) 340,000; flax 30,300. Livestock (Sept. 1954): cattle 2,373,000; pigs 1,310,000; sheep (Jan. 1954) 110,000; horses (May 1953) 221,000; mules and asses (Jan. 1953) 2,000. Meat production (1954): 349,200 metric tons. Milk production (1953): 3,537,000 metric tons. Fisheries: total landings (1954) 61,448,556 kg.

Industry.—Fuel and power (1954): coal 29,238,000 metric tons; manufactured gas 1,950,000,000 cu.m.; electricity 10,565,000,000 kw.hr. Raw materials (metric tons, 1954): pig iron 4,619,000; crude steel 4,907,000; copper, refined 153,600; lead, refined 71,900; zinc, smelter 213,100; tin, smelter 11,600; aluminium (secondary) 1,700. Manufactured goods (metric tons, 1954): cement 4,373,000; woven cotton fabrics 77,100; cotton yarn 112,500; wool yarn 38,400; rayon filament yarn 11,100; rayon staple fibre 19,400; woven woollen fabrics (1953) 24,100.

Benson, Ezra Taft (1899–), U.S. government official, was born on Aug. 4 in Whitney, Ida. He attended Utah State Agricultural college, Logan (1918–21); Brigham Young university, Provo, Utah; and Iowa State college, Ames. After spending several years farming in southern Idaho, he was employed as an agricultural agent by the University of Idaho extension service until 1930, when he was placed in charge of economics and marketing work for the state of Idaho. He held this position until 1937. He was executive secretary of the National Council on Farmer Cooperatives (1939–44) and was president of the Washington Stake, Church of Jesus Christ of Latter Day Saints, in Washington, D.C. (1940–44).

Benson was opposed to federal food subsidies and believed that they were a cause rather than a preventive of inflation; his view of federal aid for farmers gained him a number of political opponents in agricultural circles. Designated as secretary of agriculture by Pres. Dwight D. Eisenhower on Nov. 24, 1952, Benson took office on Jan. 21, 1953.

Benson's tenure in office was marked by his opposition to fixed 90% parity props for agricultural products and his advocacy of flexible supports ranging from 75% to 90% of parity. This policy earned him the enmity of large and influential agricultural groups, but he refused to modify his stand.

In late 1954 and early 1955 Benson was involved in a dispute over his ouster of Wolf Ladejinsky, an agricultural attaché in Tokyo, Jap., as a "security risk." On June 27, 1955, Benson admitted in effect that he had been overhasty in the judgments on which the dismissal had been based, and on July 2 he announced that the dismissal had been cancelled.

He was singled out by Democrats as a political target in 1955 on the issue of declining farm income.

Benton, William (1900–), U.S. publisher and public official, was born on April 1 in Minneapolis, Minn. He was graduated from Yale university in 1921. In 1929, in partnership with Chester Bowles, he founded the advertising agency of Benton and Bowles.

Benton retired from the agency in 1936 and in 1937 became vice-president of The University of Chicago, where he served on a part-time basis until 1945. In 1942, in collaboration with Paul G. Hoffman, he helped to found the Committee for Economic Development, and he was active in inter-American affairs.

At his instance The University of Chicago acquired Encyclopædia Britannica, Inc., in 1943. He financed the company, became publisher and chairman of its board and shared its ownership with the university. He launched the company into the classroom motion-picture field and served as chairman of Encyclopædia Britannica Films Inc.

Benton was appointed U.S. assistant secretary of state by Pres. Harry S. Truman on Aug. 31, 1945, and served until Sept. 30, 1947. He developed the country's first peacetime program of international information and educational exchange and took responsibility for U.S. participation in the United Nations Educational, Scientific and Cultural organization.

In Dec. 1949 Benton was appointed U.S. senator from Connecticut to succeed Raymond E. Baldwin, resigned. In the Connecticut election of Nov. 7, 1950, he was returned to the senate for two more years. In the Eisenhower landslide of 1952 he was defeated in his bid for a full six-year term. His three years in the senate were marked by his campaign in behalf of a "Marshall plan of ideas"; his vigorous espousal of the Hoover commission's recommendations on government reorganization; his resolution calling for expulsion of Sen. Joseph McCarthy of Wisconsin; by adoption of the "Benton amendment" to the Mutual Security act, aimed against communist domination of unions abroad and against cartelism; and by proposals to strengthen anticorruption laws, to liberalize immigration legislation and to improve the competitive position of small business.

In the autumn of 1955 Benton, his wife and their 13-year-old son John travelled in the Soviet Union and some of the eastern European countries to study the impact of communist propaganda on the Russian and satellite peoples.

Bequests, Philanthropic: see DONATIONS AND BEQUESTS.

Berlin. Capital of the German reich from 1871 to 1945, Berlin was still in 1954 the largest city of Germany. Area: 341.2 sq.mi. Pop.: (1939 census) 4,321,500; (1954 est.) 3,369,000. From June 6, 1945, Berlin was administered by an inter-Allied government authority consisting of the commandants of the four sectors of Berlin. After June 24, 1948, when the Soviet commandant proclaimed the dissolution of the authority, Berlin was in fact divided into two opposing administrations. By Dec. 31, 1955, the three western sectors (area, 185.7 sq.mi.; pop., 1950 census, 2,098,625; 1954 est., 2,194,000) were under the authority of the three following Allied commandants; Great Britain, Maj. Gen. R. C. Cottrell-Hill; United States, Maj. Gen. Charles L. Dasher; France, Brig. Gen. A. J. B. Gèze. In the Soviet sector (area, 155.5 sq.mi., pop., 1950 census, 1,209,269; 1954 est., 1,175,000) Maj. Gen. P. A. Dibrova was military commander. There were also two rival German city governments and two lord mayors. Otto Suhr was *Oberbürgermeister* of western Berlin, appointed by an elected city assembly; Friedrich Ebert was *Oberbürgermeister* of the Soviet sector, appointed by a meeting summoned by the Sozialistische (communist) Einheitspartei Deutschlands.

History.—West Berlin remained in a state of uneasy isolation during 1955, with the year beginning with a political crisis caused by difficulties in forming a city government. The elections of Dec. 5, 1954, did not deprive the Social Democrats of their over-all majority but reduced it to a single seat. After difficult negotiations the Social Democrats and Christian Democrats formed a joint administration on Jan. 4, holding between them 108 out of 127 seats in the city assembly. The Free Democrats, who had previously participated in a three-party government, went into opposition. Otto Suhr (Social Democrat) was elected lord mayor, and his party took 6 out of 11 seats in the senate. This administration worked well in 1955.

CHILDREN'S PARTY on a border of east and west Berlin, Ger., Aug. 13, 1955. Sponsored by Willie Kressmann (centre), mayor of the borough of Kreuzberg, West Berlin, the party was held in an effort to promote better understanding between the children of the divided city

On April 1 the economy of western Berlin was threatened by the sudden application of exorbitant dues by the German Democratic authorities on all motor traffic using the 105 mi. *Auto-bahn* from Berlin to Helmstedt in western Germany. Whereas private cars were to be charged between 10 and 30 marks for a single journey, the dues for medium-sized and heavy trucks were increased to 90 and a maximum of 240 marks respectively. Strong protests were made by the city government and by the three western powers. On May 20 the Allied ambassadors in Bonn met, in their capacity of high commissioners which still applied in Berlin, to discuss the dues. Their demands for instant reductions were rejected by the Soviet ambassador to the German Democratic Republic, G. M. Pushkin, on the grounds that the east German authorities alone could do this. His object was to secure western recognition of the communist German government. On June 4 that government reduced the dues by between 40% and 60%, but they were still between three and six times as high as before April 1. They were estimated to cost west Berlin more than 6,000,000 marks a year.

On April 26 a four-year plan for the reconstruction of Berlin was instituted. It entailed the expenditure of 150,000,000 marks on creating 100,000 new jobs, building 75,000 homes and investing in new industries. This money was additional to the 600,000,000 marks a year spent by the German Federal Republic on subsidizing western Berlin. Prizes were offered for the best plans for the rebuilding of the burnt-out Reichstag building. The four-year plan helped to reduce unemployment to a September figure of 115,000—the lowest since World War II.

The comparative tranquillity of Berlin was rudely disturbed on Sunday Nov. 27 when two U.S. congressmen and their escort were arrested by members of the east German people's police and held for four hours for questioning in the Soviet sector of the city. A sharp protest by the U.S. commandant, General Dasher, to the Soviet commandant, General Dibrova, produced only the reply that the Soviet authorities regarded east Berlin as the capital of the German Democratic Republic and not as an "occupied sector." This reply, which was instantly backed by an east German press campaign denouncing the presence of Allied troops in west Berlin, led to British, U.S. and French protests being sent to the Soviet ambassador, Pushkin.

Their three identical notes pointed out that Berlin was legally under four-power control and that Allied nationals had complete freedom of movement in all four sectors of the city. The notes

were delivered on Dec. 1 and on Dec. 2 the U.S. ambassador in Germany, James B. Conant, paid a visit to Berlin and drove round the Soviet sector for two hours. He said later that "nothing unusual" had occurred. Both on Dec. 1 and Dec. 2 western German political leaders reaffirmed the inviolability of west Berlin. (See GERMANY.) (T. PE.)

Bermuda. This British colony consists of 360 small islands (20 inhabited) 580 mi. east-south-east of Cape Hatteras, N.C. Area: 21 sq.mi. Pop.: (1950 census) 37,401 including 22,638 coloured and 14,724 Europeans; (1954 est. 40,407. Language: English. Religion: Christian (about 55% Anglican). Chief towns: Hamilton (cap.), pop. (1950) 2,810 (1955 est.) 3,000; St. Georges, 1,506, (1955 est.) 1,550. Governors in 1955, Lieut. Gen. Sir Alexander Hood (until April 21) and Lieut. Gen. Sir John Woodall (from July 6).

History.—Princess Margaret visited Bermuda in March 1955 on the way home from her Caribbean tour. Tourism remained the principal source of revenue. Visitors in 1954 numbered 106,800, an all-time record, more than 100,000 being from the U.S. A project was published to make compressed board from more than 1,000,000 cedar trees killed during the past ten years by an infestation, now under control. A trade development board was inaugurated in London. Passport and visa regulations for Bermudans and other British subjects resident in Bermuda and desiring to visit the U.S. were relaxed. A joint select committee of the legislature considered a bill providing that acquisition of Bermudan status should no longer be automatic after seven years' residence but dependent upon the grant of a certificate by the governor-in-council. (R. H. Y.)

See E. C. Gellhorn, *McKay's Guide to Bermuda, the Bahamas and the Caribbean* (New York, 1955).

Education.—Schools (1953): government maintained and aided, primary 21, pupils 6,287, teachers 261; secondary 6, pupils 722, teachers 6; vocational 1, pupils 177, teachers 10; independent, primary 12, pupils 1,023, teachers 34; secondary 4, pupils 300, teachers 17.

Finance and Trade.—Monetary unit: Bermuda pound, at par with sterling. Budget (1954 actual): revenue £2,976,251, expenditure £3,389,381. Foreign trade (1954): imports £12,500,000, exports £3,270,000. Main exports: cut flowers (lilies) and concentrates and essences.

Best Sellers: see BOOK PUBLISHING AND BOOK SALES.

Betting and Gambling. The principal developments in gambling in the United States during 1955 were legal and political. In New York state the continued to be strong political support for a constitutional amendment that would permit bingo games and raffles (a form of lottery) for religious and charitable fund-raising purposes. Toward the end of the year, operators of bingo games began to rely on previous court rulings that a "free" bingo game, held in conjunction with some form of entertainment to which no admission fee is charged, is not illegal. Similar rulings had permitted "bank nights" at motion-picture theatres during the 1930s. Accordingly, there were frequent concerts or variety shows with free bingo games as an added attraction.

Another legal development in New York was a ruling of the state supreme court that a losing bettor could not recover money lost through legal pari-mutuel machines at a race track. In common law and often by statute one can recover gambling losses from a person who won the money in any manner not specifically permitted by law.

The volume of gambling in the United States and throughout the world was generally estimated to be about the same as in previous years following World War II. The U.S. internal revenue service collected only \$9,558,000 from the \$50 annual tax imposed on professional gamblers, a decline of about \$1,000,000 from the preceding year, but it is assumed that the majority

professional gamblers do not voluntarily pay the tax.

(A. H. MD.)

Great Britain.—There was a small reduction during 1955 in the stakes in football pools, which were £70,000,000, as compared with £74,000,000 in 1954. The reduction in stakes coincided with the introduction of postal cash betting, legalized for the first time by the Pool Betting act, 1954. Before this act came into force it was illegal for persons betting on football pools to send their stake money before the matches had been played and it was a common practice to send it with the entry for the following week's pools. The fact that competitors were now able to enclose the stake money with each entry may have been one of the causes of the reduction in the total stakes.

The number of pool promoters required to register under the act was nearly 200, including a large number of promoters running pools to raise funds for the support of sporting and other activities. The total stakes in such pools appear to have been comparatively small and from the information submitted to local authorities in accordance with the requirement of the Pool Betting act, it appeared that 80% of the total stakes was accounted for by stakes in pools promoted by the four largest companies.

The figures published in the press by large football pool companies of the amounts deducted from stakes for the promoter's commission and expenses showed that the deductions varied from about 18% to about 24%.

The total amount staked on dog-track totalizators (£57,000,000) showed a further reduction of about 1% on the figure for 1954. The amount staked in totalizator betting on horse racing (£25,000,000) and the amounts staked in the Irish Hospitals Sweepstakes (£10,000,000) showed no significant change. The total personal expenditure on all forms of gambling (*i.e.*, the total amounts staked less the amounts returned in the form of winnings) were estimated at about £70,000,000 for 1955, as compared with about £75,000,000 for 1954.

There were two important decisions in the divisional court *Pearse v. Hart* [1955] I.A.E.R. 91 and *Maynard v. Williams* [1955] I.A.E.R. 81 which established that lotteries regularly conducted for the purpose of raising funds for sporting and other objects may be illegal even if they are restricted to members of a club or society formed for these objects. A private member's bill was introduced by Sir Eric Errington, to amend the law so as to enable small lotteries to be conducted for such purposes by voluntary societies registered with a local authority, subject to conditions limiting the amount and size of the prizes and to restrictions on the publicity to be given to the lotteries. Debate on the second reading of the bill took place in the House of Commons on Feb. 18, but was not concluded.

In Queensland, Australia, the Racing and Betting act, 1954, was passed: the act included, *inter alia*, provisions for the licensing of off-the-course cash betting offices. (See also HORSE RACING.)

(A. W. PN.)

Bhutan. An Indian-protected princely state in the Himalayas, Bhutan lies between India (Assam [south and east] and West Bengal [southwest]), Tibet (north and northwest) and Sikkim (west). Area: about 19,305 sq.mi. Pop. (1954 est.): 300,000, mainly Bhutaneses, Bhotias or Duk-pa of Tibetan origin (*Bhot*=Tibet); also many Nepalese in the south. Language: a Tibetan dialect. Religion: Duk-pa Buddhism, a crude unreformed Lamaism. Capitals: Punaka (winter) and Tashi-Chödzong (summer). Maharaja, Jigme Dorji Wangchuk.

History.—At the beginning of 1955 the Indian government drew the attention of the Chinese government to the fact that on a map of China published by the Institute of Geography of the Academia Sinica, and prepared by Chen Shu-peng, the eastern half of Bhutan was included in China. The communist gov-

ernment replied that the map was originally prepared under the Nationalist government and that its reissue without correction was an oversight. In June R. K. Nehru, a senior official of the Indian ministry of external affairs, visited the protectorate. He was the first official visitor since India became independent.

Economy.—Annual subsidy from India, Rs.500,000; annual trade with India, about Rs.776,000. Chief products: rice, Indian corn, millet, timber. Livestock bred: elephants and ponies. Chief manufactures: fine swords, muzzle-loading muskets, fly-whisks (chowries), lac, wax, cloth and musk.

Bicycling: see CYCLING.

Billiards. Irving Crane of Binghamton, N.Y., in 1955 ended the reign of Willie Mosconi as the recognized world pocket-billiard champion by winning a four-man round-robin tournament at Philadelphia, Pa., in April. Mosconi had held the title since 1950.

Crane, the champion in 1942 and 1946, captured the crown in 1955 by winning six of his seven matches. He clinched the laurels by defeating Mosconi, 150 to 87, in a 32-inning play-off. Mosconi finished second with a 5-2 won-lost record. Jimmy Caras was third with a 2-4 mark and Erwin Rudolph last with 0-6.

Mosconi made one successful defense of the title in 1955, beating Joe Procita, 1,800 to 794 in a 12-block match in Philadelphia, Pa., in February.

Rodney Boyd of Ohio State university, Columbus, captured the intercollegiate pocket championship and Robert Strange of Michigan State college, East Lansing, retained the three-cushion honours. Bob Blackham of the University of Utah, Salt Lake City, took the straight-rail crown, while Judy Ferles of the University of Arizona, Tucson, won the co-ed pocket title.

In college team competition, Arizona won the men's and women's pocket championships. The University of Oregon, Eugene, finished on top in the men's three-cushion event and Michigan State took the men's straight-rail crown.

John F. Scully of the Madison Square Boys' club, New York, captured the Boys' Clubs of America senior title. Michael Doran of the Flatbush Boys club, Brooklyn, was first among the juniors, and Tompkins Square of New York replaced Princeton, Ind., as the team champion.

(P. BR.)

Biochemistry. **Nucleic Acids and Growth.**—Many new discoveries in biochemistry were disclosed at the third International Congress of Biochemistry which was held Aug. 1 to 6, 1955, in Brussels, Belg. One of the most important finds had to do with nucleic acid and growth. Although earlier investigators had presented evidence suggesting that there was a correlation between nucleic acid content of cells and their rate of growth, E. F. Gale now showed that a change in the nucleic acid content of certain bacteria, *Staphylococcus aureus*, is followed by a corresponding change in the rate at which these cells are able to synthesize protein and to grow. Gale also provided some evidence that nucleic acid may be required for protein synthesis. Using disrupted staphylococci he showed that the removal of nucleic acid results in cessation of protein synthesis while the replacement of the extracted nucleic acid enables the cell fragments to resume the synthesis of some proteins.

In his latest experiments Gale attacked the problem of the mechanism by which nucleic acids may influence organized protein synthesis. Sonically disrupted staphylococci can incorporate amino acids into their protein fraction by what appears to be an exchange reaction occurring between the added amino acid and the amino acids in protein of the cell. This incorporation is not the result of net protein synthesis but may be one of the reactions occurring during protein synthesis. Disrupted cells

lose their ability to incorporate amino acids when their nucleic acid is removed but addition of nucleic acid to the incubation mixture restores the ability to incorporate amino acids. Gale studied the effect of nucleic acid fragments on the incorporation of various amino acids into the protein fraction of these disrupted cells.

Degradation of ribonucleic acid (RNA) obtained from these bacteria by ribonuclease did not abolish its ability to reactivate the amino acid exchange reactions in the bacteria. Although RNA preparations from yeast or liver are inactive in stimulating the exchange reaction, when these preparations are digested they also are active in promoting incorporation of a variety of amino acids into disrupted staphylococci. Gale fractionated the digested nucleic acids by using a combination of chromatographic and ionophoretic procedures. The fractions obtained were tested for their ability to replace intact RNA in the incorporation of specific amino acids. In several cases Gale obtained single fractions from the digest which promote the incorporation of amino acids. The remarkable fact demonstrated was that different active fractions promote the incorporation of specific and different amino acids. In all cases the purified fraction was at least 100 times as effective as intact staphylococcal RNA. Gale identified some of the active fragments as small polynucleotides and suggested that these active factors represent specific groupings forming loci for the combination of specific amino acids, and bringing about exchange of those amino acids with corresponding ones in protein of the preparation.

Synthesis of Polynucleotides.—During the year a clue to the mode of synthesis of nucleic acid was obtained. Considerable progress was made in understanding the reactions involved in the synthesis of the nucleotides, the constituent units of nucleic acid, and of the formation of the large polynucleotides (*i.e.*, nucleic acids) from mixtures of nucleotides. The recent progress was made possible largely by the discovery of specific enzymes which will carry out the synthetic reactions. The enzymes involved in nucleotide synthesis were not completely identified. However, an enzyme which can synthesize polynucleotides was found by S. Ochoa and his co-workers in the microorganism *Azotobacter vinelandii* and was partially purified and its activity characterized. When the purified enzyme was incubated with inosine diphosphate (a nucleotide containing two phosphates instead of one), and magnesium ion, 50%-60% of the diphosphate disappeared and there was liberated an equivalent amount of inorganic phosphate. The missing nucleotide was accounted for by a water-soluble high-molecular-weight product which was precipitated by acid and alcohol. The chemical properties of this compound indicated that it was a polymer of the nucleotide inosinic acid. The same enzyme also catalyzed the formation of polymers of the other nucleotides which are found in nucleic acids. Using mixtures of diphosphonucleotides Ochoa found that mixed polynucleotides were formed by the action of the enzyme. The enzyme was named polynucleotide phosphorylase; it was thought that it might be the major mechanism for the synthesis of polynucleotide chain.

Urea Formation and Carbon Dioxide Fixation.—More than 15 years earlier H. A. Krebs showed that urea, the main excretory product of N metabolism in man, was formed from two moles of NH_3 and one mole of CO_2 by a cyclic process involving the amino acids ornithine, citrulline and arginine. Citrulline was apparently formed from ornithine by the addition of one mole of CO_2 and one mole of NH_3 . During 1955 the detailed chemical mechanism for this reaction was revealed in experiments conducted in the laboratory of F. Lipmann. It was found that a hitherto unknown compound, carbamyl phosphate, could react with ornithine to form citrulline and release inorganic phosphate.

The first reaction of the CO_2 and NH_3 is a condensation to form carbamate. This reaction is spontaneous and apparent does not require an enzyme. The carbamate is then enzymatically phosphorylated by adenosine triphosphate (a high energy compound) to form the new high energy compound, carbamyl phosphate:

The carbamyl portion then is transferred enzymatically to ornithine to form citrulline. Subsequent reactions convert citrulline to arginine which is then hydrolyzed to urea and ornithine so that the cycle can be repeated.

In addition to its role in urea synthesis carbamyl phosphate was found to play an important role in another synthetic reaction. In the presence of the proper enzymes carbamyl phosphate reacts with the amino acid aspartic acid liberating inorganic phosphate and transferring the carbamyl group to the amino group of aspartic acid. The new compound which is formed is called ureidosuccinate. Ureidosuccinate had been previously found to be a precursor of the pyrimidine bases which are found in the nucleic acids.

Clinical Applications of Biochemistry.—There was an increasing trend in the use of biochemistry in medicine. In addition to improving diagnostic tools, there was work in many laboratories devoted to the searching out of the basic biochemical lesions in disease, often on a cellular, enzymatic or even molecular level. Anaemias in particular received a great deal of attention. A number of different hereditary anaemias are characterized by abnormal types of haemoglobin. The relation of the nature of the diet to blood lipid fractions and the occurrence of atherosclerosis also commanded much attention. The latest work suggested that a diet rich in fat leads to a high cholesterol content of blood serum and that this high cholesterol content of the serum is correlated with a high frequency of atherosclerosis.

Recent work on glycogen storage diseases showed that these diseases can be distinguished on the basis of glycogen structure. In six cases of liver glycogen disease decreased activity of the enzyme glucose-6-phosphatase which is involved in glycogen formation was detected. There was also great interest in work that had been done in the past few years on several chemical compounds which might be of some use in mental diseases. Compounds such as mescaline and D-lysergic acid diethylamide tartrate were found to produce reversible schizophrenialike symptoms in man; the lysergic acid compound is extremely active, being effective in doses of one microgram per kilogram of body weight. Birth Control.

A growing awareness by government leaders and the public of the world's dangerous imbalance between overpopulation and natural resources became apparent in 1955. (A world population growth of 90,000 a day was estimated by the United Nations department of social affairs.) Attention was focused on the need for deve-

g a new, simplified and inexpensive contraceptive method—one which would be acceptable to people of diverse cultural backgrounds. Under the auspices of the Planned Parenthood Federation's Dickinson Research Memorial fund, medical research pointing toward a contraceptive pill or injection made tangible progress during the year. M. C. Chang, research biologist at the Worcester Foundation for Experimental Biology under the direction of Gregory Pincus, predicted that such a pill might be available to the general public within five years. Chang, who received a 1955 Lasker award in planned parenthood for outstanding research in animal and human fertility, announced that several compounds which worked well on laboratory animals were ready to be taken over by physicians for controlled tests on men and women.

Lasker awards in planned parenthood were given also to Howard C. Taylor of Columbia University College of Physicians and Surgeons, and to Lady Dhanyanthi Rama Rau, founder and president of the Family Planning association of India, for their work in the family planning field.

International.—The first international birth control meeting ever held in Latin America took place in San Juan, P.R., where the International Planned Parenthood federation's western hemisphere region held its pioneer conference in May 1955. An appeal was directed to the World Health organization to include child-spacing instruction in its program of preventive medicine. Resolutions were also sent to the UN Commission on Human Rights and the Inter-American Commission of Women asking that the right to space children be recognized as a basic human freedom.

Another major international family planning meeting was held in 1955 when the International Planned Parenthood federation met in Tokyo in October for its fifth world conference on planned parenthood. Delegates from 15 countries in Europe, Asia, Africa, Australia and the Americas, including some of the world's most eminent scientists in the sex physiology and population fields, presented latest findings on world population trends, natural resources, family planning methods, marriage guidance and sex education, infertility, abortion and sterilization.

A panel of experts in education, medicine, psychiatry, religion, social work and business made an intensive examination of family life patterns at a symposium held during the American Planned Parenthood federation's 35th annual meeting in May. Geared to the theme of "The Family in Pursuit of Happiness," panelists traced the growth of family life from birth through marriage and parenthood into its relationship with the community and the world.

U.S. Services.—The year 1955 also marked the start of a long-range program designed to make the services of Planned Parenthood more readily available to all families that need it. The new emphasis on reaching more people was conducted with wider use of communications mediums—literature, radio, TV and motion pictures. A graphic account of Planned Parenthood's four-point program of birth control, aid to the childless, education for marriage and marriage counselling, and research was unfolded in the Planned Parenthood federation's annual report for 1954 (published in 1955). The program was being conducted by the federation and its 110 state leagues and local committees in 29 states and the District of Columbia, and had been endorsed by numerous religious bodies and prominent clergymen.

At the Margaret Sanger Research bureau, New York city, physicians and students from medical colleges all over the country came to receive instruction in contraceptive techniques. The bureau was the only teaching centre in the U.S. offering education and instruction in all phases of the planned parenthood program.

Affiliates' activities were conducted by nearly 4,500 volun-

teers and 450 employees. U.S. birth control clinics numbered 536—378 of which were in public health clinics, hospitals and medical schools, and 178 were sponsored by Planned Parenthood committees—reaching a total of nearly 250,000 people. Medical assistance to help infertile couples was provided by Planned Parenthood in 31 infertility clinics and 65 referral centres. An additional 119 infertility clinics were located in hospitals and medical schools across the country.

(M. SR.)

Birth Statistics. The birth rate in the United States continued to rise through 1954. According to provisional data, live births in that year passed 4,000,000 for the first time in the history of the country, with an estimated 4,021,000 births registered and a rate of 25.0 live births per 1,000 total population. Including an allowance for unregistered births raised the total to 4,076,000, the birth rate becoming 25.3 per 1,000 population. This rate for 1954 was the highest for any year since the early 1920s. However, provisional data for the first eight months of 1955 showed a decrease of 1.2% in the birth rate compared with the like period of 1954, notwithstanding a small increase in the number of births. The rate decreased because the rise in population was more rapid than the rise in the number of births.

Provisional data for the first eight months of 1955, compared with the like period for the year before, showed increases in births in the New England states, the middle Atlantic states, the north central states and the mountain and Pacific states. On the other hand, decreases were reported for the south Atlantic and the south central areas. However, within each of these geographic divisions there were some states that showed increases and others with decreases. For the complete year 1954, the birth rates among the individual states ranged from a low of 21.6 per 1,000 population in New Jersey to a high of 32.9 births per 1,000 population in Utah. The birth rates per 1,000 population according to geographic division were as follows: New England, 22.8; middle Atlantic, 22.1; east north-central, 25.3; west north-central, 24.7; south Atlantic, 26.6; east south-central, 26.9; west south-central, 27.1; mountain, 28.8 and Pacific, 24.3.

Provisional data for Canada for the first eight months of 1955 indicated a rise of 4% in the number of births over the

Birth Rates per 1,000 Population in Selected Countries for 1953 and 1954

Country	1954	1953	Country	1954	1953
North America			Italy	17.6	17.5
Canada	28.7	28.2	Netherlands	21.6	21.8

like period of 1954. On the basis of provisional records the total number of births for 1954 was estimated as 435,132, the birth rate being 28.7 per 1,000 total population. For England and Wales, the provisional birth data during the first half of 1955 showed a drop of 2.4% from the similar period of 1954. For the country as a whole, births totalled 672,635 in 1954,

with a birth rate of 15.2 per 1,000. There were 48,431 births in New Zealand in 1954 among the population of European origin, the rate being 24.6 per 1,000. Australia recorded 202,256 births (exclusive of full blood aborigines) during 1954, with a birth rate of 22.5 per 1,000. Both Australia and New Zealand showed an increase in birth rates for the first quarter of 1955, compared with the same period of the year before. Recent birth rates for a number of countries are shown in the table.

The latest year available with births classified according to age of mother was 1952. In that year, the rates for live births (adjusted for under-registration) per 1,000 female population in successive age groups were as follows: 10-14 years, 0.9; 15-19 years, 85.4; 20-24 years, 218.1; 25-29 years, 180.4; 30-34 years, 113.1; 35-39 years, 56.1; 40-44 years, 15.3 and 45-49 years, 1.2. For all ages under 35 years, these rates were greater than the corresponding figures for 1946, the first full post-World War II year. For example, the rate at ages 15-19 years in 1952 was 44% greater than in 1946. The increases amounted to 20% at ages 20-24 years, 12% at ages 25-29 years and 4% at ages 30-34 years. The decreases at the higher ages were relatively small. Notwithstanding these increases, the rate of first births to mothers had been tending downward in the postwar years; first births to women of ages 15-44 years occurred at a rate of 33.9 per 1,000 in 1952, or 12% less than in 1946. On the other hand, births of higher order to mothers up to the seventh showed increases, the rise amounting to 28%. For eighth and higher orders of births to mothers the rate had been tending downward for many years. (See also CENSUS DATA, U.S.; INFANT MORTALITY.) (M. Sp.)

Blind, Education of the. During 1955 the questions of an internationally accepted definition of blindness and economic provisions for the severely handicapped (including the blind) continued to receive attention. The resolutions on these two subjects adopted by the world assembly of the World Council for the Welfare of the Blind in August 1954, and endorsed by the conference of World Organizations Interested in the Handicapped as well as by the United Nations Technical Working Group on the Rehabilitation of the Handicapped, were considered again in May 1955 by the United Nations Social commission at its tenth session, at which time the commission authorized the secretary-general to circulate letters to all governments, drawing their attention to the recommended definition of blindness. The matter of handicap allowances was set aside for more detailed consideration by the committee concerned with the whole area of family income.

One of the important adjuncts to the adoption of an international definition of blindness is the determination of the actual extent of blindness throughout the world. Based on varying definitions of blindness, estimates range from 6,600,000 as reported by the UN World Health organization in Jan. 1953 to informal estimates of 14,000,000, the latter probably being the more nearly correct. The greatest incidence of blindness, in comparison with the general population, is found in the middle and far east and certain parts of Africa. In the United States, as of July 1, 1954, it was estimated that there were approximately 320,000 blind persons, or an average of 1.98 for each 1,000 of the general population. Of this number, approximately 10% were under 20 years of age, and 50% over 65 years. Figures for Canada, the U.K. and most other western European countries were comparable to those reported in the U.S.

Formal plans were made for the calling of a joint seminar on the vocational rehabilitation of the blind, under the sponsorship of the World Council for the Welfare of the Blind and the

BLIND WORKERS at a toy manufacturing company in Chicago, Ill. Vice president J. Heller (centre, in dark suit) first hired blind workers in 1949; 1955 90% of the employees were blind persons, and business had increased from \$300,000 to \$2,000,000 annually. According to Heller, the increase resulted from the greater efficiency and lack of absenteeism of the blind workers.

World Veterans federation, to be held in London, Eng., in the spring of 1956. One important aspect of the program would be discussions looking to the provision of adequate training for graduates of schools for the blind.

Early in 1955, the American Foundation for Overseas Blind set up a field mission in Korea, a territory where all previous services to the blind had been completely wiped out because of the war. At the request of the Philippine government, the American Foundation for the Overseas Blind was also providing services of a trained rehabilitation expert for a period of one year to supervise the introduction of vocational rehabilitation services for the blind in that country.

In the United States, the congress appropriated \$234,000 for the fiscal year beginning July 1, 1955, to the American Printing House for the Blind for the provision of schoolbooks and materials for the education of the 7,500 children enrolled in 109 schools and classes for the blind throughout the country. The 1920 Vocational Rehabilitation act, amended during 1954 by congress, provided that the federal government, through the Office of Vocational Rehabilitation of the department of health, education and welfare, would assume the necessary state administration cost and the cost of vocational counselling and placement of blind individuals, while certain other expenses, including vocational training, would be shared by the state and federal governments. An average of 3,500-4,000 blind persons are rehabilitated each year through the provisions of this law.

In Brazil, a National Council for the Blind was established composed of representatives from 26 Brazilian institutions for the blind. In Chile, following the recommendation of the American Conference on the Welfare of the Blind and Prevention of Blindness held in São Paulo, Braz., June 1954, a training program for teachers of the blind was set up at the Univer-

Chile, Santiago. The course began on April 1, 1955, with an initial group of 30 students. In Hong Kong a training program for blind women was inaugurated. The UN Demonstration Center for the Blind in Cairo, Egy., continued to expand, the second group of trainees from Arabic countries beginning their studies in Sept. 1955.

UN consultants surveyed the education of the blind in Syria, Brazil and Burma, and paid a return visit to Pakistan to supervise the implementation of recommendations which had been made following a survey of that country in 1954. Surveys of blindness and the establishment of local rehabilitation centres continued in Kenya, West Africa, Uganda, the near east, south-east Asia and the Caribbean under the auspices of the British Empire Society for the Blind. Helen Keller made an extensive tour of the orient early in 1955, her itinerary including India, Pakistan, Indonesia, Burma, the Philippines and Japan.

Braille printing plants were established during the year in Calcutta, Ind., and Montevideo, Urug. Additional Braille duplicating machines and other Braille printing equipment were installed in Brazil, Chile, Mexico, the Netherlands, Bolivia, Morocco and Nigeria.

In order to assist with the distribution of Spanish-language Braille material to all Latin America, a program was worked out whereby the American Foundation for the Overseas Blind would extend financial assistance to allow for production of materials at the Mexico City Braille printing plant for export to other Spanish-speaking countries throughout the region. (See also EYE, DISEASES OF THE.) (F. E. D.)

Blood, Diseases of the. During 1955, steady advances occurred in the understanding of various disease states and of the mechanisms concerned in their development.

The Blood Cells.—The description of changes in the red cells by Greek-derived words indicating variations in size, shape, staining characteristics, etc. (anisocytosis, poikilocytosis) had been in use for more than 50 years. During 1955, some advance was made in understanding the chemical reasons behind certain shape changes. Thus the spherically shaped red cell was found to be associated with alterations in ATP (adenosine triphosphate), a substance concerned with carbohydrate (sugar) function. Such spherical cells developed with the storage of blood in blood banks and there was some evidence that this shape change could be prevented by the use of certain sugars, thus preventing the blood from going "foul."

Previously, the development of sickled red cells, so important in sickle cell anaemia, and of numerous target-shaped red cells (target cells), was traced to alterations in haemoglobin. As of 1955, two normal types of haemoglobin were present, A or adult and F or foetal; C, D, E, G, H, I, J and S types of abnormal haemoglobins were demonstrated. Most of these were found in the "coloured" races (black, yellow, etc.), but instances of their occurrence in apparently pure whites were noted. The abnormal haemoglobin in the red cells of persons affected was always on a genetic (hereditary) basis, with transmission of the abnormality from one or the other parent. Inheritance of the abnormality from both parents resulted in severe anaemia. Discovery was made that chromium was a constant constituent of the red cell. This led to the development of radioactive chromium (chromium 51) as a tagging agent for the red cell. By use of this tag, it was possible to determine accurately the life span of the cells in the person under study. In practice, a tiny quantity of radioactive sodium chromate was mixed with a small amount of the subject's blood, thus tagging a known quantity of blood cells. These were then reinjected in the subject and the degree of radioactivity in the red cells then studied from

day to day. Such studies were of considerable value in studying the blood needs of wounded soldiers at battlefield stations, and in determining the diminished life span of red cells in certain blood-destructive (haemolytic) anaemias.

Actual studies of the chemistry of the intact white cells is difficult. However, methods were developed in recent years to study chemical and enzymatic constituents of white cells (histochemistry) without tearing them apart for analysis. Such studies demonstrated the profound chemical differences existing between one type of white blood cell (the granulocyte) and another (the lymphocyte). Other studies indicated that the granulocyte lost a certain enzymatic constituent (phosphatase) prior to the development of a certain leukemic state.

The Erythropoietic Hormone.—Scientists had postulated that some regulatory influence was required to make red blood cells grow in the bone marrow and to cause their increased production when blood was lost or destroyed. In experiments with rabbits, Erslev demonstrated that the blood plasma of rabbits that had been bled had the capacity when injected of stimulating blood production in normal rabbits. A definite rise in new red cells occurred in the blood and was paralleled by indications in the bone marrow of increased production. In other experiments, Contoupolis and his group in California demonstrated in rats that the pituitary gland was essential for normal red cell production. By carefully controlled work, stimulation of red cell production was demonstrated to reside in a fraction of the pituitary gland and was distinct from ACTH. Administration of specially prepared extracts of the pituitary gland resulted in stimulation of red cell production in normal rats and improved the anaemia of rats whose pituitary gland had been removed. These and other investigations indicated strongly that a hormone or at least a "humoural" factor was essential for normal blood production and became increased during haemorrhage. Although this work was in its first stages, its possible importance in the treatment of hypoplastic (poor marrow production) anaemias was obvious.

Radioactive Vitamin B₁₂.—Exceedingly small, even trace amounts, of vitamin B₁₂ are essential for the normal production and maturation of the red blood cells. This vitamin is normally present in the diet in amounts far exceeding nominal requirements, but it cannot be absorbed from the gastrointestinal tract without the aid of a substance present in the lining of the stomach known as intrinsic factor. The absence of intrinsic factor results in low body levels of vitamin B₁₂ and consequently in faulty red blood cell development. This condition is called pernicious anaemia and may be treated by injections of B₁₂. It was found recently that B₁₂ was effective by mouth when it was combined with the lining or intrinsic factor of the stomach, obtained from hog or cattle stomach. Such combination therapy reduced the necessity of frequent injections.

The potency of present preparations of intrinsic factor varied greatly. The introduction of vitamin B₁₂ labelled with radioactive cobalt proved to be helpful in measuring the effectiveness of various intrinsic factor preparations. If a given intrinsic factor preparation was ineffective, the radioactive-labelled vitamin would not be absorbed but would pass through the gastrointestinal tract to be excreted in the faeces. There it could be detected by radioactivity counting devices similar to Geiger counters. However, an effective intrinsic factor preparation would result in good absorption of the concomitantly administered oral vitamin B₁₂. Absorption would result in detectable radioactivity in the liver (storage site of the vitamin), and also, following excretion, in the urine; only small amounts would be detectable in the faeces.

Use of radioactive-labelled vitamin B₁₂ also proved of value in establishing the diagnosis of pernicious anaemia. Establishing

BLOOD-WARMING DEVICE which maintains body temperature as blood passes from donor to patient, shown in a 1955 demonstration. The equipment was designed by Volney C. Wilson (left) for use in transfusions to new-born infants whose blood is contaminated with Rh antibodies

the correct diagnosis in a person with a history of past anaemia is important since in pernicious anaemia continuous therapy is essential while other anaemias do not require prolonged maintenance therapy after normal blood values are restored. A patient with pernicious anaemia, even if his blood values have been corrected by therapy, always lacks intrinsic factor. Hence, by the test described, he would be unable to absorb orally administered radioactive-labelled vitamin B₁₂, and consequently hepatic and urinary radioactivity would not be detectable following administration of the vitamin.

Haemorrhagic Disorders.—No radical improvement in the treatment of haemophilia took place within the year, and reliance had to be placed, as before, on transfusions of fresh whole blood or plasma.

The thrombocytopenias; *i.e.*, the disorders in which reduction in blood platelets was present, were often benefited (1) by platelet transfusions using plastic bag blood and (2) by the use of such steroids as prednisone. This was the case whether the reduced platelet number was the result of destruction of the bone marrow or diminished production of platelets because of some temporary immunologic process. Removal of the spleen was reserved for some of the latter cases, especially of the chronic variety. It was becoming apparent in 1955 that removal of the spleen for cases of idiopathic thrombocytopenic purpura was often unsuccessful. Therapy with the steroids, particularly meticorten, even for long periods, was often of value, either with the spleen intact or following splenectomy if a poor response took place after this operation.

Drug thrombocytopenic purpura, particularly that resulting from quinidine (a heart medication), was becoming an important condition for both recognition and treatment. Some of the drug purpuras were violent requiring frequent transfusions of fresh blood in plastic bags. With recovery of the patient, complete withdrawal of the offending drug was a necessity. A special type of haemorrhagic disorder, often of great severity, was that associated with destruction (lysis) of the blood clot. Fibrinolysis was encountered with increasing frequency in cases of cancer of the prostate gland, in lung surgery and during pregnancy and at the time of delivery. It became apparent that in these conditions a delicately balanced mechanism (fibrinolysis vs. anti-fibrinolysis) became disturbed with the result that the forces of clot destruction took over, leading to haemorrhage. During pregnancy and delivery this was helped in some instances by the

use of large amounts of fibrinogen injected into the veins, blood in large amounts and by steroids.

Basic research into the various coagulating and clot-producing substances continued. Methods to dissolve clots besides the use of heparin and dicumarol were being studied.

Leukemia.—Leukemia represents an unbridled growth of one of the white cell forming tissues, a growth without apparent reason, and which ultimately leads to the death of the person in whom it develops. During 1955 basic research into the incidence of the causes, the mechanisms of white cell growth and the means of controlling the growth urge of this malignant process continued. Although the causes for leukemia were not known, one of them—in chicken leukemia—had been traced to a virus infection many years previously. The virus theory for leukemia was revived chiefly through the publications of Gross, who maintained that leukemia in mice was transmitted from parent mouse to their offspring through reservoirs of virus which might remain inactive for years until a "trigger" mechanism (X-ray, chemical, etc.) would activate it. Whether this concept, which was bolstered by injections of cell-free leukemic material, was applicable in humans was not yet clear. Studies of the inner (histo) chemistry of the leukemic cell indicated that some differences could at times be detected. Control of the growth of the leukemic cell by altering its inner machinery became more and more possible with the development of chemicals, which while seeming to be good for the tumour cell and thus taken up by it, actually were bad for it and destroyed it. Myleran, a new "sulfone," was synthesized by Haddow's group and had specific effects against one type of leukemia (chronic granulocytic), whereas lympheran (CB-1348) a new nitrogen mustardlike material seemed to have a specific effect against malignant lymphoid tissue. These were optimistic bits in the otherwise over-black picture of leukemia and lymphosarcoma.

The treatment of leukemia and its related conditions such as lymphosarcoma and Hodgkin's disease was by no means the hopeless, futile thing of less than 10 years back. Now with a battery of chemicals of various types, some of them highly specific, with transfusions, antibiotics, X-rays and radioactive isotopes, the specialist in this field had at least some tools for the struggle to improve the life span of the person afflicted. Ultimate control (not necessarily cure) of the leukemic process seemed to be within the foreseeable future. (See also PHYSIOLOGY.)

(W. Dk.)

Blue Cross: see INSURANCE.

Bobsledding. The team of Bud Washbond of Keene Valley, N.Y., and Pat Martin of Massena, N.Y., won the two-man bobsledding championship of the Amateur Athletic Union of the United States at Lake Placid, N.Y., on Feb. 5, 1955. Their time for the four heats down the Monroevan Van Hovenberg run was 5 min. 4.06 sec. Monroe Flagg of Saranac Lake, N.Y., piloted his sled to victory in the national A.A.U. four-man races with the elapsed time of 4 min. 46.67 sec. Teamed with Flagg were Bud Miller, Chuck Randolph and Jack Lamy. An accident that resulted in the death of Franklin Beatty of Ausable Forks, N.Y., marred the championship. Riding with Beatty when his sled shot off the course at "zigzag" curve was Jack Young, Schuyler Carron and Joe Meconi, all of Ausable Forks, who were injured less seriously. The North American amateur meet was cancelled because of the lack of snow.

World Championships.—Stanley Benham of Lake Placid was barred from international competition for three years by the executive committee of F.I.B.T. (Federation Internationale de Bobsleigh et Tobogganing), meeting at St. Moritz, Switzerland, Jan. 29. The group based its decision on Benham's withdrawal

on the four-man races of the 1954 world championships and so from letters addressed to the press and president of the world body. Benham had withdrawn from the competition because he could not find a suitable sled. John Helmer, John Wells and Pat Martin, who with Benham had been chosen to represent the United States in the four-man test at the 1956 Olympics, resigned from the Olympic squad following the banning of Benham. Swiss stars swept the two-man and four-man titles in the 1955 world meet at St. Moritz. Fritz Feierabend annexed his third world two-man crown when he and a countryman, Harry Varbourton, flashed down the 1,600-m. course four times in the total time of 5 min. 33.28 sec. The No. 1 U.S. sled, driven by Pick Severino of Saratoga Springs with Bill Williams of Rockingham, N.C., as brake, placed sixth. Franz Kapus piloted a Swiss team to victory in the four-man event, being clocked at 10 min. 10.52 sec. Severino's U.S. four placed sixth. (T. V. H.)

Bolivia. Bolivia is a landlocked republic in south central South America. Area: 424,162 sq.mi.; pop. (1950 census) 3,019,031; (1954 official est.) 3,162,000. The legal capital is Sucre, pop. (1950 census) 38,400; the actual seat of government is La Paz, pop. 266,763. Other major cities (with pop., 1950 census) include Cochabamba 74,949, Oruro 58,706, Potosí 33,579, Santa Cruz 34,005 and Tarija 16,474. Racial distribution is estimated to be 52.34% Indian, 27.5% mestizo, 13.08% white, 0.22% Negro and 6.85% unspecified. Religion is predominantly Roman Catholic. President in 1955: Victor Paz Estenssoro.

History.—The Bolivian government under Pres. Victor Paz Estenssoro continued to promote development of the petroleum industry and diversification of agriculture as basic aspects of its program to expand and lend resiliency to the national economy. Railroad, highway and pipeline construction was pushed forward, and light industrialization was encouraged on a selective basis. United States financial and technical assistance made possible many advancements, including the opening of new oil wells in the Bermejo sector, the construction of a six-inch pipeline from the Camiri oil fields to the Argentine frontier, and the establishment of a factory in Cochabamba to manufacture oil drums and other containers.

The president divided a large coffee-growing area near Santa Cruz among individual farmers in February, implementing the land reform program of the National Revolutionary Movement (Movimiento Nacional Revolucionaria) which he headed. A special United Nations technical assistance program was initiated in September to help farmers improve their coffee and tobacco crops. The cultivation of rice and wheat was also encouraged.

A 423-mi. railroad between Santa Cruz, Bol., and Corumbá, Braz., was inaugurated in January, closing the final gap in the transcontinental system of railways and highways which joins Brazil, Chile, with Santos, Braz. Bolivia and Peru jointly initiated surveys for a railroad along the southern shore of Lake Titicaca between Guaqui, Bol., and Puno, Peru. Bolivia and the United States formed the Inter-American Co-operative Highway Service in October to build and improve Bolivian roads. Projects included paving part of the Cochabamba-Santa Cruz highway, constructed as a joint venture in 1954.

Pres. Paz Estenssoro and Pres. Carlos Ibáñez del Campo of Chile agreed in February to revise customs duties and trade regulations to facilitate exchange of Bolivian petroleum for Chilean iron and steel. In July Paz Estenssoro discussed utilization of the water resources of Lake Titicaca with Pres. Manuel Odría of Peru.

In April the government suppressed a conspiracy attributed to the clerical, conservative Falange. Although opponents charged his regime with permitting communist influence in high

places, Paz Estenssoro repeatedly denounced communism—as well as fascism—as inimical to the interests of the nation. Spokesmen of the powerful Central Labor organization urged the president and Vice President Siles Suazo to disregard the constitutional prohibition against two successive terms and to run for re-election in the May 1956 contest. (R. HN.)

Education.—Bolivia in 1950 had 1,500 rural schools with 110,000 pupils and 1,595 elementary schools with 147,060 pupils. There were 104 secondary schools (national and private) with 18,029 pupils and also 38 technical schools and 16 training schools for teachers with total enrolment of 7,955. There were universities with more than one faculty at Cochabamba, La Paz, Oruro, Potosí and Sucre; enrolment in institutions of higher learning was 4,642. Education was scheduled to receive 14% of governmental expenditure in 1955.

Finance.—The monetary unit is the boliviano, valued during 1955 at 0.52 cents U.S. currency, official rate, and on Aug. 26, 1955, at 0.03 cents, legal free rate. The 1955 budget, as issued on May 1, 1955, estimated revenue at Bs. 29,322,000,000 and expenditure at Bs. 30,282,000,000. The public debt on Dec. 31, 1953, was placed at Bs. 37,487,400,000, including the foreign debt amounting, with accrued interest, to the equivalent of Bs. 30,487,400,000. Currency in circulation on Dec. 31, 1954, totalled Bs. 19,870,000,000; demand deposits Bs. 10,100,000,000; gold reserves of the Central bank (May 31, 1955) \$1,800,000. The cost-of-living index at La Paz stood at 1,780 in June 1955 (1948=100).

Trade and Communications.—Exports in 1954 (excluding gold) were about \$94,300,000 (1953: \$124,500,000); imports, \$60,100,000 (1953: \$83,400,000). Leading exports in 1954 were tin (64%), tungsten (15%), lead (6%), silver (6%) and zinc (5%). Leading customers in 1953 were the U.S. (55%) and the U.K. (41%); leading suppliers, the U.S. (32%), Argentina (14%), Peru (14%), Canada (9%) and the U.K. (7%).

Railway lines in operation (1955) totalled 1,690 mi. Four new lines were in various stages of construction. The highway system (1949) comprised an estimated 15,420 mi., of which 4,008 mi. were improved. Motor vehicles on Jan. 1, 1954, included 6,128 automobiles, 14,962 trucks and 791 buses.

Agriculture.—Important crops included wheat, maize, barley, rice, potatoes and cotton. The 1950 census showed 3,849,000 cattle; in 1951 there were an estimated 4,000,000 sheep, 700,000 goats, 400,000 pigs and 1,800,000 llamas and alpacas. The principal exploited forest products were rubber and cinchona bark.

Manufactures.—The aggregate capital of Bolivian industry in 1950 was Bs. 2,404,068,000. In 1948 there were 2,305 factories with 25,000 employees. Most important, in terms of value of production, were electricity, textiles and clothing, beverages, foodstuffs and glassware and ceramics.

Minerals.—Mineral exports and values in 1954 included tin 29,287 metric tons (\$60,071,000); wolfram (tungsten) 2,667 tons (\$14,156,000); lead 18,227 tons (\$5,603,000); zinc 20,397 tons (\$4,735,000); silver 5,043,563 fine oz. (\$4,259,000); copper 3,662 tons (\$2,325,000); antimony 5,218 tons (\$1,608,000). Production of crude petroleum was 269,482,000 l. (1,660,000 bbl.), more than 90% of which was produced at the Camiri field. Crude oil refined totalled 1,528,500 bbl. (J. W. Mw.)

Book Collecting. During 1955 the improving economic situation continued to encourage in the book markets, as in other enterprises, a further increase in trade already at a level, and occasionally at a price, beyond that ever before attained. At the Sylvain S. Brunschwig sale in Geneva many books acquired within the last ten years more than doubled their earlier valuation. And at several sales in London and New York books from the vast André de Coppet collection sold at five times the price realized 20 years before. Even if these spectacular advances were discounted, the upward trend was readily apparent in total sales, which seemed to be running more than 20% above the record for the previous year.

In the United States the book attracting the greatest interest (and, at \$25,000, the highest price) was the Phillippus copy of *The Journal of Major George Washington*, printed in 1754 at Williamsburg, Va., when the author was 21. One of eight known copies, and perhaps the last to appear for public sale, it was recovered with funds provided by Mrs. John D. Rockefeller, Jr., for presentation to Colonial Williamsburg Incorporated. With its return the authorities decided to reconstruct the printing office of William Parks, the place where it was first issued.

While the *Journal* illustrates the marked demand for historical Americana, a demand which was being stimulated by numerous publications devoted to the period of the Revolution and the Civil War, there was much less interest in American literary

classics. At the Swann galleries in New York a complete collection of the books Merle Johnson designated as "high spots" evoked only a moderate response.

Among other works there were three, of German, British and American origin, which excited international discussion. Though final word was still awaited from officials at the Pierpont Morgan library, who in 1954 reasserted the Constance missal as the earliest book printed by Gutenberg, several demurrers appeared from other sources, notably one by Vincent Scholderer in the *Book Collector*. The bicentenary of Samuel Johnson's *Dictionary* was celebrated not only by exhibits in England and the United States but by the issue of a book on this book. The centenary of Walt Whitman's *Leaves of Grass* was also observed by many libraries, including the British Museum. An elaborate display at the Detroit Public library, however, was closed when a thief made away with one of Whitman's memorandum books.

Aside from these several events, all essentially of a private nature, there were other and most welcome signs of governmental intercession in behalf of concerns dear to bookmen. To further the cause of international good will, the governments of both the United States and the U.S.S.R. announced that they had returned to the countries of their origin various historic and artistic objects displaced in World War II. Russian diplomatic officials in London also arranged the publication, in the *Book Collector*, of an article describing the little-known but greatly significant resources of the Saltykov-Shchedrin State Public library in Leningrad. Western material deposited there includes 8th-century manuscripts of Bede and the Anglo-Saxon Gospels, a 15th-century manuscript of Guido delle Colonne, the whole of Voltaire's library (acquired by Catherine the Great) and an almost complete collection of books from the press of Aldus Manutius and the Elzevirs.

The year 1955 also witnessed the end of several long-awaited projects and the beginning of new programs. In England, almost five centuries after his great contribution to the making of books, a memorial tablet to William Caxton was finally unveiled at Westminster abbey; at the Bodleian library the recommendation of its founder in 1611 had eventually brought about the replacement of the "ruinous little rooms" with more suitable accommodations; and at Cambridge an idea conceived in 1870 had now become reality in a sumptuous catalogue of the 15th-century books at the University library. The first volume was published of Jacob Blanck's *Bibliography of American Literature*, a comprehensive survey which, when completed, would encompass the work of 287 authors.

(W. B. TD.)

Book Publishing and Book Sales.

The number of new books and new editions published in the United States between Oct. 1954 and Oct. 1955 totalled 12,088, continuing the upward trend of recent years. The total for the calendar year 1954 was 11,901, as compared with the high in U.S. book production in 1953 of 12,050. The figures for the first ten months of 1955 indicated a rise over same period of the previous year, 10,287 titles against 10,100. Fiction titles for January through October totalled 1,778 in 1955 compared with 1,861 in 1954. Juveniles were higher than the previous year, 1,276 compared with 1,161. Technical books showed a drop in 1955 for the first ten months to 368, compared with 381, while business books rose to 251 against 212. Religious titles, which had gained the previous year, dropped slightly to 669, compared with 713.

Best Sellers.—The best-seller list as of September is seldom the same as the year-end list because of the heavy bookstore sales in the last three months of the year. For example, in 1954 *Not as a Stranger* by Morton Thompson, which headed the final best-seller list of the year, was third on the list in September,

while Daphne du Maurier's *Mary Anne*, which led in September, was runner-up by the end of the year.

In Sept. 1955 *Marjorie Morningstar* by Herman Wouk, the author of the popular *Caine Mutiny*, was first on the list although it had only been published that month. This record was based on reports from 56 booksellers located in various parts of the United States. *Auntie Mame* by Patrick Dennis was in second place. Third on the list was *The Man in the Gray Flannel Suit* by Sloan Wilson, followed by *Something of Value* by Robert Ruark, *Bonjour Tristesse* by Françoise Sagan, *Band of Angels* by Robert Penn Warren, *Not as a Stranger* by Morton Thompson (the 1954 best seller still on the list), *The Sixth of June* by Lionel Shapiro, *The Flower Girls* by Clemence Dane and *No Time for Sergeants* by Mac Hyman, in that order.

In nonfiction, Anne Morrow Lindbergh's *Gift From the Sea* first published in March 1955, headed the list, followed by *The Power of Positive Thinking* by Norman Vincent Peale, which had been on the best-seller lists for 35 months and in second place for the years 1953 and 1954. Other nonfiction best sellers in Sept. 1955 were *A Man Called Peter* by Catherine Marshall, *How to Live 365 Days a Year* by John A. Schindler, *The Family of Man* by Edward Steichen, *Why Johnny Can't Read* by Rudolf Flesch, *Onions in the Stew* by Betty MacDonald, *Grandfather Stories* by Samuel Hopkins Adams, *Hiroshima Diary* by Michihiko Hachiya and *Never Plead Guilty* by John W. Noble and Bernard Averbuch.

Book Sales.—The *Publishers' Weekly* stated in its annual 1955 fall announcement number that out of 65 publishers reporting on their sales, 53 reported that their business was ahead of 1954, with average gains between 9% and 15%. Six reported their business on a par with 1954, and the six whose business was off gave 3% to 5% drops.

The latest printed statistics on book sales in the fall of 1955 were those prepared by Robert W. Frase of the American Book Publishers council for house subcommittee hearings in the spring of 1954 on the Universal Copyright convention. This estimate gave the total book sales in the United States for 1954 at \$602,500,000 and the number of books printed at 766,400,000. Of this total, trade books (adult and juvenile including hardbound reprints) numbered 144,400,000 and the publishers' receipts amounted to \$100,700,000. Trade books thus represented 18.8% of the 1952 book sales in copies and 16.7% of the book sales in dollars. In 1953 the American Book Publishers council estimated the publishers' receipts for trade books as totalling \$103,200,000.

Retail book sales on a national average showed an increase of 6% or 7% in August compared with Aug. 1954, according to the reports issued by government agencies. For the first seven months of the year bookstores showed a 1% decrease in dollar volume of sales, although the books and magazines in book departments in department stores showed a 5% rise for the same period.

Book Prices.—According to a report in the *Publishers' Weekly* for Dec. 11, 1954, the average retail price of novels rose in 1954 to \$3.50 (based on 187 volumes from 42 publishers) from \$3.29 in 1953 (based on 212 volumes from 42 publishers). The average retail price of biographies dropped in 1954 to \$4.40 (based on 145 volumes from 53 publishers) from \$4.67 a year before (105 volumes from 39 publishers) and history too was down to \$5.56 (75 volumes from 38 publishers) from \$6.04 in 1953 (75

Average retail prices	1954	1953	1952	1951	1950	1949	1948	1947
Novels	\$3.50	\$3.29	\$3.26	\$3.03	\$3.02	\$2.86	\$2.97	\$2.86
Biography	4.40	4.67	4.66	4.03	4.47	3.98	—	3.98
History	5.56	6.04	5.45	5.68	5.21	5.06	—	5.06

(Not counted among novels tabulated were mysteries, westerns, science fiction and anthologies. An informal listing of prices of mysteries showed that the average price was \$2.65 in the fall of 1953.)

volumes from 39 publishers).

Paper-Bound Books.—The estimate made for the number of paper-bound books distributed in 1955 reached a total of 300,000,000 copies of 1,000 different titles, compared with estimates of 240,000,000 for 1953 and 230,000,000 in 1952. A catalogue of *Paperbound Books in Print*, first issued in the summer of 1955, listed about 4,500 titles available from about 40 publishers. These ranged in price from 25 cents to approximately \$2.50. (See also AMERICAN LITERATURE; ENGLISH LITERATURE; etc.)

Boston. Boston, the capital city of the Commonwealth of Massachusetts, was founded in the year 1630 and incorporated by act of the legislature of Massachusetts on Feb. 3, 1822. The municipal government of Boston is administered by a mayor, a city council of nine members and a school committee of five members. The mayor is elected for a four-year term and city council and school committee members are elected at large for terms of two years.

The population of Boston according to the 1950 federal census was 801,444 and the land area of the city is 47.81 sq.mi. The city is located in Suffolk county on the Atlantic coast and has an excellent harbour and shipping facilities.

The 1955 tax rate was \$69.80 per \$1,000 of assessed valuation and was levied on real estate and personal property evaluated at \$1,541,500,000. The total tax levy for 1955 was \$107,596,700. The number of municipal employees as of Feb. 1, 1955, was 2,684.

The gross funded debt of the city was \$122,029,500 as of Sept. 30, 1955. Sinking funds provisions had been made to meet these obligations in the amount of \$62,545,147.53, leaving a net funded debt of \$59,484,352.47.

The most outstanding and significant municipal development of 1955 was the commencement of an urban redevelopment program. The first of a series of projects, under the supervision and direction of the Boston Housing authority, for the reclamation of decadent slum areas that were to be cleared in various sections of Boston to redevelop the city, affected an area of approximately 15 ac. in the southern section of city bordered by Albany, Dover, Washington, Motte and Way streets.

This area was characterized by over-age buildings crowded on the land and by narrow streets crisscrossed by major traffic thoroughfares.

The Boston Housing authority acquired the land by eminent domain. All families residing in the area were relocated in housing projects if they desired. When the demolition of the buildings was completed, the authority would install the site improvements, rough grade the land and then sell or lease the land to private redevelopers at fair value for development for light industrial or commercial uses. These sites would provide plant locations in the central business area which were protected from traffic congestion, blight and declining property values with all of the advantages of a suburban location for a minimum 40-yr. period. Each firm locating in the area would be protected by controls, which would be incorporated into each deed of sale or long-term lease and would be binding until 1994.

These controls were designed to produce the best redevelopment and generally provide for (1) use of the land, (2) building features, (3) off-street truck loading and (4) off-street parking.

The total estimated project cost was \$4,800,000. The esti-

AT THE FINISH LINE, Hideo Hamamura of Japan breaks the tape at the end of the 1955 marathon race as Mayor John B. Hynes of Boston chases him carrying the victory garland

mated re-use value of the project land was \$660,000 and the net project cost would be shared by the city of Boston and the federal government, one-third or \$1,380,000 to be paid by the city and the remaining two-thirds or \$2,760,000 to be paid by the federal government. As the result of surveys conducted by the housing authority, it was estimated that the taxable assessed valuation of the completed development would be twice the value before the commencement of the project. The increase in taxes to the city on this increased valuation would offset the cost to the city within ten years.

(J. P. LY.)

Botany. Continued investigations of the path of carbon in photosynthesis emanating from the laboratory of M. Calvin at the University of California culminated in 1955 in what appeared to be a fairly complete description of carbon fixation through energy from activated chlorophyll. Carbon dioxide attaches first to ribulose diphosphate, apparently forming a beta keto acid which splits to yield two molecules of phosphoglyceric acid. These are reduced to phosphotriose which may be condensed to yield hexose or by a series of transketolations involving four, five, six and seven carbon sugars may yield ribulose diphosphate which can accept another molecule of carbon dioxide. Energy, ultimately from photoactivated chlorophyll, enters the cycle at the reduction of glyceric acid and at the phosphorylation of ribulose. The mode of transfer of energy from activated chlorophyll to the carbon fixation was still unknown. L. N. M. Duysens, however, had demonstrated spectrophotometrically that a cytochrome becomes oxidized and diphosphopyridine nucleotide becomes reduced in the light. These serve as electron carriers in respiration and their participation in photosynthesis had been indicated previously. Evidence that cytochrome oxidase participates in photosynthesis was supplied

by A. R. Krall and R. H. Burris.

Five trace elements have generally been held necessary for plant growth, and during the year vanadium was added to this list as a requirement by algae. Others were shown to stimulate growth or to be essential for some animals. Cobalt was placed in the latter category. Osmound Holm-Hansen, G. C. Gerloff and F. Skoog showed that cobalt is essential for the proper growth of four blue-green algae. Cobalt is a constituent of the B₁₂ molecule, and the need for cobalt may be replaced by the addition of small amounts of this vitamin. The authors suggested that the physiological activity of cobalt is higher when incorporated in the vitamin B₁₂ molecules than when supplied as a free ion. Although two of the species investigated can fix nitrogen, the requirement for cobalt is independent of the nitrogen source. While examining the possible need of cobalt by higher plants, T. C. Broyer and co-workers discovered that chlorine was required. Hence in two years the number of micro-nutrient elements known to be required by algae, and probably by higher plants, was increased from five to eight.

By the use of the isotopic nitrogen technique, G. Bond and G. D. Scott demonstrated the fixation of nitrogen in two species of lichens and in one liverwort. In all three of these plants the blue-green alga *Nostoc*, which previously was known to fix nitrogen, is a symbiont and the nitrogen fixation can probably be attributed to this organism. Experiments on the mycorrhizal roots of *Calluna vulgaris* and *Pinus silvestris*, which had been held by some workers to be nitrogen-fixing, yielded negative results.

At the University of Wisconsin, Madison, physiologists Miller, Skoog, Von Saltza, Strong and Okumura found that autoclaved preparations of desoxyribose nucleic acid promoted cell divisions when added with auxin to tobacco pith cultures. The active substance was identified as 6-furfurylaminopurine (kinetin). With this additional regulator, undifferentiated tobacco pith cells can be caused to enlarge (auxin), produce root and shoot initials (adenine), or divide without differentiation or cell enlargement (auxin plus kinetin). While kinetin may not be a natural product, a regulator with similar properties had long been sought in plant tissues.

Sporelings of the fern *Marsilea*, grown aseptically in various concentrations of sugars, principally glucose, were investigated morphologically and anatomically by A. Allsopp. Both the external morphology and the anatomy of the plants grown in low sugar concentrations (1%–2% glucose) had many characteristics of water forms of amphibious plants, whereas those grown at higher concentrations (4%–5%) had characteristics of typical land forms. The water forms are not merely reduced forms arising by inhibition, for the direction and duration of cell division are different in the rhizome apices of the two types of sporelings. The author concluded that the differences between land and water forms are not the result of change in carbohydrate nutrition as previously thought but that changes in sugar concentration, when other conditions remain constant, exert their effects through the alteration of the osmotic pressures of the medium. It was considered that the increased osmotic pressures of the higher sugar concentrations are analogous in their effects on the plant to growth under normal land conditions.

In 1914 E. W. Sinnott recognized three main types of foliar nodal anatomy in dicotyledons and concluded that a trilacunar condition was primitive among the angiosperms. Margery P. F. Marsden and I. W. Bailey in a recent paper showed that a fourth type of nodal anatomy, a unilacunar double-trace condition, occurs in *Clerodendron trichotomum*. Since this type is commonly found among the ferns and gymnosperms, Marsden and Bailey suggested that it may prove to be primitive for the angiosperms.

In a report on 56 microfossils (spores and sporelike material) from the Devonian of Canada, N. W. Radforth and D. C. McGregor concluded that the flora of this period may have been more complex than the macrofossil record has so far indicated. Since rocks of Devonian age are associated with the occurrence of gas or oil, the microfossils were expected to be of considerable use in establishing the age and stratigraphy of the potentially oil-bearing strata.

One of the outstanding works to appear in the field of taxonomy was the monograph of the genus *Clarkia* (Onagraceae) by Harlan and M. E. Lewis. The monograph was particularly timely since considerable genetic and cytological work had been done with various species of the genus.

New Books.—*Colchicine—in Agriculture, Medicine, Biology and Chemistry*, by O. J. Eigsti and Pierre Dustin, Jr.; *The Genus Nicotiana*, by T. Harper Goodspeed; *An Introduction to Plant Taxonomy*, by George H. M. Lawrence; *Auxins and Plant Growth*, by A. Carl Leopold; *Origin and Distribution of British Flora*, by J. R. Matthews; *Cryptogamic Botany*, 2 vol., 2nd ed. by Gilbert M. Smith; *Plant Regulators in Agriculture*, by H. B. Tukey; and *An Introduction to the Study of Fossil Plants*, by John Walton. (See also PALAEONTOLOGY.)

(C. W. HN.; C. B. HR.)

Arboretums and Botanical Gardens.—*United States.*—The final assessment of damage done by the 1954 hurricanes to arboretums along the eastern seaboard showed that the planting in the Swarthmore, Tyler, Barnes and Morris arboretums in the Philadelphia area and the Arnold arboretum (Boston) suffered greatly, while little damage was done in the Brooklyn and New York Botanical gardens. Even as far north as the Reef Point gardens, Bar Harbor, Me., the effect of at least one of these storms was felt. Serious wind damage also occurred in the Hoy Arboretum (Oregon) where winds of hurricane proportions also uprooted many trees in February 1955.

Changes at the Morton arboretum at Lisle, Ill., included the building of a new wing on the administration building for research laboratories, new offices and a new lecture hall. Two new propagating greenhouses and one experimental greenhouse were also part of the building project, and about 600 ac. of land were added to the holdings for arboretum plantings.

A new botanical garden in Nassau county (New York) entered the planting stage, where 21 of the 900 ac. in Nassau county park at Salisbury were set aside for this purpose. Planting was also started on the 300-ac. tract about the Topeka State hospital (Kansas), where plans for an arboretum had been dormant for a long time.

Changes in arboretum personnel included the appointment of Russel J. Seibert (formerly director of the Los Angeles and County arboretum, Calif.) as the new director of Longwood gardens, Pennsylvania, and the nomination of W. S. Stewart (formerly professor of horticulture at the University of California, Riverside Experiment station) as director of the Los Angeles State and County arboretum, in California. (D. WN.)

Great Britain.—At the Royal Botanic gardens, Kew, England, there was considerable activity during 1955 in the reconstruction of several hothouses. In the Jodrell laboratory, work continued on the anatomy of the monocotyledons and of the Gramineae in particular. At the Herbarium, the final part of volume I of the revised edition of the *Flora of West Tropical Africa* by R. V. J. Keay went to the press following the publication in 1954 of 72 families in the first part. The National Dianthus collection was maintained in the Herbarium experimental ground. Preparation of a *Flora of Cyprus* was begun and work continued on the *Flora of Tropical East Africa*, while two botanists left Kew on an expedition to Tanganyika financed by the colonial office.

In the Royal Botanic garden, Edinburgh, H. R. Fletcher, w

left the garden in 1951 to take up the post of director of the Royal Horticultural society's garden at Wisley, returned to Edinburgh in 1955 as assistant regius keeper. Several members of the staff were engaged in taxonomic work on the flora of the eastern Mediterranean region. B. L. Burt continued his taxonomic research on the family Gesneriaceae, P. Green on the family Oleaceae, H. H. Davidian on the genus *Rhododendron* and D. M. Henderson on the cryptogams.

At the University Botanic garden, Cambridge, the main work during the year apart from the normal routine was a continuation of the extension and development of the garden made possible by the Reginald Cory fund. A further clearing was carried out of the 20 ac. of allotments that were to be incorporated into the garden. (See also HORTICULTURE.) (F. N. HR.)

Bowles, Chester

(1901—), U.S. author and lecturer, was born on April 5 in Springfield, Mass. He attended Choate school and Yale university, graduating in 1924, worked for a year on the *Springfield Republican* and four years in a New York advertising firm. In June 1929, in partnership with William Benton (*q.v.*), he started the advertising firm of Benton and Bowles, Inc., and in 1936 he became chairman of its board of directors.

In June 1942 he was appointed district director of the Office of Price Administration for the state of Connecticut. In the following year Pres. Franklin D. Roosevelt named him national OPA administrator. In early 1946 Pres. Harry S. Truman made him director of economic stabilization with responsibility for anti-inflation wage, price and production controls.

In Nov. 1946 Bowles was appointed a U.S. delegate to the first conference of the United Nations Educational, Scientific and Cultural organization in Paris, Fr., and in the early spring of 1947 he became international chairman of the United Nations Appeal for Children.

In Nov. 1948 Bowles was elected governor of Connecticut. During the two years of his administration he introduced legislation providing for expansion of public education, housing, welfare and child care programs, labour legislation and reorganization of the state government. He was defeated for re-election in 1950 by a narrow margin.

President Truman appointed Bowles U.S. ambassador to India and Nepal in Sept. 1951.

After the election of Pres. Dwight D. Eisenhower, Bowles resigned as ambassador and returned to the United States in early 1953 with bipartisan recognition of his contribution to improved U.S.-Indian relations.

Author of *Tomorrow Without Fear* (1946) and the best seller *Ambassador's Report* (1954), he has lectured and written widely in America and travelled extensively in Africa and India. He is one of the best informed people in the United States on the current situation in Asia and has had considerable influence on American opinion in this field. (R. R. R. B.)

Bowling

The Pfeiffer's Beer five of Detroit, Mich., won the American Bowling congress open team title in 1955 for the third time, scoring 3,136 in the 52nd annual tournament that ran from March 26 through June 5 at Fort Wayne, Ind. Pfeiffer's had won in 1953 and in 1952, as the E. & B. Beer team. The winning quintet, composed of Thern Gibson, Bill Willard, George Young, Lou Sielaff and Fred Bujack, set a new record with team prize winnings of \$6,046.42. Eddie Gerzine of Milwaukee, Wis., who rolled a series of 225, 235, 278 for 738 on March 28, saw his score stand up through the long competition to gain first in the singles division. Harry Zoeller and George Pacropis of Wilkes-Barre, Pa., triumphed in the doubles with a total of 1,365. Bujack captured the all-events crown with

1,993 and set an individual mark in earnings by winning \$2,068.33. Bowling continued its tremendous gains in popularity in 1955 and the A.B.C. certified a record number of 7,062 establishments with 60,648 alley beds during the year.

Junie McMahon of Fairlawn, N.J., was the only man elected to the American Bowling congress Hall of Fame in 1955. Steve Nagy of Cleveland, O., was first in the year's All-Star tournament with a ten-day total of 307.17, figured on the Petersen scoring system (1 point for every 50 pins and 1 point for each game won). Nagy averaged 207 for 100 games, including 36 in the qualifying rounds. He also was named "Bowler of the Year" for the second time. The 1955 Masters' competition, at Fort Wayne, attracted a star-studded field, with the top prize being captured by Buzz Fazio of Detroit.

Ernie Bence of Fairleigh Dickinson college, Rutherford, N.J., won the Eastern Intercollegiate congress match-game championship. Minnesota retained the team title of the Western (Big Ten) conference.

Nellie Vella of Rockford, Ill., took singles honours in the 37th Woman's International Bowling congress tournament at Omaha, Neb. Marion Ladewig of Grand Rapids, Mich., won the all-events crown with 1,890, and paired with Wyllis Ryskamp to win the doubles with an all-time record total of 1,264. The year saw membership in the W.I.B.C. reach a total of 706,192 members, who rolled in 22,482 supervised leagues. Sylvia Wene of Philadelphia, Pa., was selected as "Woman Bowler of the Year." Miss Wene, who won the Women's Masters' competition in January, led the W.I.B.C. bowlers in averages for two successive years (1953-54) with 206.

Duckpins.—Dave Volk of Baltimore, Md., won the 25th annual classic sponsored by the National Duckpin Bowling con-

National Duckpin Champions

Men's singles—Walter Surowiecki, Meriden, Conn.	445
Men's doubles—Tom Fitzgerald and George Velos, Fall River, Mass.	861
Men's all-events—Tom Fitzgerald	1,248
Men's team—Guida's Dairy-Blue Ribbons, New Britain, Conn.	1,988
Women's singles—Edith Christensen, Washington, D.C.	420
Women's doubles—Julie Dubiel and Ann Plude, Avon, Conn.	766
Women's all-events—Elizabeth Barger, Baltimore, Md.	1,152
Women's team—Brunswick Red Crowns, Pimlico, Baltimore	1,800
Mixed doubles—Frances Kupec, Windsor, Conn., and George Pelletier, Danielson, Conn.	792

gress. Volk defeated 121 rivals in the tourney at Washington, D.C. (T. V. H.)

Boxing

Boxing in the United States continued its slight upward rise during 1955, following the trend set the previous year, with the reopening of a number of clubs on a weekly basis, notably in California and Texas, the return of the sport to a number of sectors that had been inactive for many years, the lesser number of bouts televised, locally and nationally, and the interest created in the Rocky Marciano-Archie Moore fight for the world heavyweight title.

World Championship Matches.—Rocky Marciano, undefeated world heavyweight champion, ran his unbeaten string to 49 professional bouts, by twice successfully defending his title during 1955. On May 16, at Kezar stadium, San Francisco, Calif., he knocked out Don Cockell, of Great Britain, in the ninth round, before a crowd of 15,235. On Sept. 21, Marciano turned back the bid of Archie Moore, world light heavyweight champion, by scoring a knockout in the ninth round, after being dropped for the second time in his career in the second round. The fight, held at Yankee stadium, New York, drew a paid attendance of 61,574. Both heavyweight title bouts were screened exclusively for theatre-television. The Marciano-Moore fight was viewed in 133 theatres and drive-ins in 92 cities by 350,000 persons.

SLUMPED TO THE CANVAS, challenger Archie Moore lies against the ropes after being knocked out in the 9th round of his world heavyweight championship fight with Rocky Marciano, Sept. 21, 1955

Archie Moore, world light heavyweight champion, defended his title once during 1955, scoring a three-round knockout over Carl (Bobo) Olson, world middleweight champion, at the Polo Grounds, New York, on June 22.

Ray Robinson regained the middleweight title on Dec. 9 by knocking out Carl (Bobo) Olson in the second round at Chicago stadium.

World welterweight champion Johnny Saxton lost his title by a technical knockout in 14 rounds by Tony DeMarco, on April 1 at the Garden, Boston, Mass. DeMarco, 70 days later, on June 10, after one of the shortest reigns on record, was knocked out by Carmen Basilio in the 12th round, to lose the title. The fight took place at Syracuse's War Memorial stadium, N.Y. Basilio again stopped DeMarco in a return bout on Nov. 30 at Boston.

Jimmy Carter, world lightweight champion, who had won the title three times, lost it for the third time on June 29, when Wallace (Bud) Smith won a 15-round decision over him at the Garden, Boston. On Oct. 19 in a return bout Smith pounded out a 15-round decision over Carter at Cincinnati, O., to clinch his hold on the title.

For the first time in almost three and a half years the world featherweight title was defended when Champion Sandy Saddler (in the U.S. army 1952-1953) met the challenge of Teddy (Red Top) Davis on Feb. 25, at Madison Square Garden, New York. Saddler retained the title with a 15-round decision.

Robert Cohen, world bantamweight champion, severely injured in an automobile accident early in the year, recovered and defended his title against Willie Toweel at Johannesburg, U. of S.Af., on Sept. 3. Cohen retained the title when the bout was declared a draw after 15 rounds.

Earlier in the year, on March 9, Raul (Raton) Macias, North American bantamweight champion, engaged Chamrern Songkitrat, of Thailand, in a bout in San Francisco billed by the National Boxing association as a world title bout. The National Boxing association, having withdrawn support from Cohen, sanctioned this contest. Macias scored a technical knockout over

Songkitrat in 11 rounds.

Pascual Perez, world flyweight champion, defended his title against Yoshio Shirai in Tokyo, Jap., on May 31, scoring a five-round knockout. He had won the title from Shirai the previous November.

Boxing Hall of Fame.—Nine new members were elected to the Boxing Hall of Fame in 1955, which was inaugurated the previous year by *The Ring* magazine and is housed in The Ring museum in Madison Square Garden. The board of directors voted in two ancients, pioneers of the game, William Richmond and William Thompson (Bendigo). The Old Timers' committee voted in four fighters—Terry McGovern, Abe Attell, Sam Langford and Joe Walcott, while the modern group also elected four—Mickey Walker, Harry Greb, Benny Leonard and Gene Tunney.

The following is a complete list of those who had been elected to the Hall of Fame:

Pioneer Group:—John L. Sullivan, heavyweight; James Figg, heavyweight; Jack Broughton, heavyweight; Daniel Mendoza, heavyweight; Tom Cribb, heavyweight; John Jackson, heavyweight; Tom Hyer, heavyweight; Jack Dempsey, heavyweight; John Morrissey, heavyweight; Tom Sayers, heavyweight; John C. Hennessey, heavyweight; Jem Mace, heavyweight; Arthur Chambers, lightweight; Jack McAuliffe, lightweight; Young Griffo, featherweight; William Richmond, heavyweight; William Thompson (Bendigo), heavyweight.

Old Timers' Group: Stanley Ketchel, middleweight; Bob Fitzsimmons, heavyweight; Jack Johnson, heavyweight; Joe Gans, lightweight; James J. Jeffries, heavyweight; James J. Corbett, heavyweight; Terry McGovern, featherweight; Abe Attell, featherweight; Sam Langford, middleweight; Joe Walcott, welterweight.

Modern Group: Jack Dempsey, heavyweight; Joe Louis, heavyweight; Henry Armstrong, welter, light and featherweight champion; Mickey Walker, welter and middleweight champion; Harry Greb, middleweight; Benny Leonard, lightweight; Gene Tunney, heavyweight.

Amateur Boxing.—In the eastern amateur Golden Gloves championships, held in Madison Square Garden in March, individual champions were: heavyweight, Roy Bullock, New York; 175-lb., John Horne, Washington, D.C.; 160-lb., Rudolph Corney, New York; 147-lb., James Archer, New York; 135-lb., Thomas Schafer, Pittsburgh, Pa.; 126-lb., Walter Taylor, Washington; 118-lb., Robert St. John, New York; 112-lb., Joe Regores, Miami, Fla.

In the western finals, held in the Chicago Stadium, individual champions were: heavyweight, Eddie Catoe, Kansas City, Mo.; 175-lb., Eddie Jenkins, Detroit, Mich.; 160-lb., Jesse Bowdoin, St. Louis, Mo.; 147-lb., Richard Wall, Tulsa, Okla.; 135-lb., Willie Morton, Kansas City; 126-lb., Harry Smith, Cedar Rapids, Ia.; 118-lb., Donald Eddington, St. Louis; 112-lb., Tom Reynolds, St. Louis.

In the inter-city finals, held in the Chicago Stadium, March 31, before 13,439, the eighth tie since the series was inaugurated in 1928 was recorded. Individual champions were: heavyweight, Eddie Catoe, Chicago; 175-lb., John Horne, New York; 160-lb., Rudolph Corney, New York; 147-lb., James Archer, New York; 135-lb., Manny Davis, Chicago; 126-lb., Walter Taylor, New York; 118-lb., Donald Eddington, Chicago; 112-lb., Tom Reynolds, Chicago.

In May, the U.S. Golden Gloves team invaded the United Kingdom and was defeated by a British Amateur Boxing association team, 5 bouts to 4, the U.S. losing an additional bout by default because of injury.

(N. FL.)

Great Britain.—The Welsh flyweight Dai Dower, who won the Empire title in 1954, added to his list the British European titles by beating Eric Marsden in February and Italian Nazzareno Giannelli the following month. In October, however, he was surprisingly beaten in a contest for the European title by Young Martin, of Spain, and his hopes of a world title fight were thus extinguished.

After losing his British featherweight title to the Irish

illy Kelly in January, Sammy McCarthy showed a welcome return to form, and was later rematched with Kelly for the British and European titles.

No suitable opponent being available, bantamweight champion Peter Keenan was not called upon to defend his British title; but he scored a sensational win in the 14th round over Jake Tuli, of South Africa, when they met for the Empire championship in October.

The lightweight title was recaptured by Frank Johnson, of Manchester, when he outpointed the holder, Joe Lucy of London, in April; while in the welterweight division the holder, Wally Thom, was still waiting for a suitable challenger to emerge from the eliminating contests arranged by the British Boxing Board of Control.

The Birkenhead boxer Pat McAteer won the middleweight title in June when the holder, Johnny Sullivan, was disqualified in the 9th round.

After Randolph Turpin beat Alex Buxton in two rounds in April, to add the Empire cruiserweight title to his British crown, it was hoped to match him against Archie Moore for the world championship. In October, however, Turpin was stopped in four rounds by an almost unknown Canadian, Gordon Wallace. Later Turpin relinquished his titles.

(W. B. Dy.)

British Amateur Boxing association, champions, 1955:

Lightweight: Gunner Derek Lloyd (Army B.A.)
Bantamweight: Pvt. George Dormer (Army B.A.)
Featherweight: Tommy Nicholls (Sankeys, Wellington)
Lightweight: Stephen Coffey (Manchester County Police)
Light Welterweight: Francis McQuillan (Dundee).
Welterweight: Pvt. Nicky Gargano (Army B.A.).
Light Middleweight: Bernard Foster (Mitchells and Butlers)
Middleweight: Frank Hope (St. Teresa).
Light Heavyweight: David Rent (Maple Leaf, Bootle).
Heavyweight: Dennis Rowe (Glamorgan Police).

Boy Scouts: see SOCIETIES AND ASSOCIATIONS, U.S.

Brando, Marlon (1924–), U.S. actor, was born at Omaha, Neb., April 3, 1924, and was educated at Shattuck military academy, Faribault, Minn. After study at the Dramatic Workshop in New York city, he played with a stock company, then made his Broadway debut in Oct. 1944 in *I Remember Mama*. His first big stage success was as Gowalski in Tennessee Williams' *A Streetcar Named Desire* in 1947, although he had received good notices for his part in George Bernard Shaw's *Candida* the preceding year. His first motion-picture role was as a paraplegic war veteran in *The Men* (1950), which received wide critical acclaim, as did his subsequent performances—in the motion-picture version of *A Streetcar Named Desire* (1951) and in *Viva Zapata!* (1952), *Julius Caesar* (1953), *The Wild One* (1953), *On the Waterfront* (1954) and *Désirée* (1954). On March 30, 1955, Brando was awarded the Academy of Motion Picture Arts and Sciences "Oscar" as the best motion-picture actor of 1954, for his part as a gang member in *On the Waterfront*.

Brazil. A federal republic in eastern and central South America, with an area of 3,287,195 sq.mi., Brazil is second in size only to Canada in the western hemisphere. Language: Portuguese. Religion: predominantly Roman Catholic (39,177,80 according to the 1950 census), with about 1,500,000 Protestants of all denominations and 500,000 Spiritualists. Chief cities: Rio de Janeiro, the federal capital (1955 est. pop.), 2,725,274; São Paulo (1953 est. pop.), 2,500,000; Recife, 560,000; Salvador, 460,000; Porto Alegre, 440,000; Belo Horizonte, 430,000; Fortaleza, 300,000; Belém, 275,000.

The president in 1955 was João Café Filho.

The population, estimated (1955) at 58,456,000, was, accord-

ing to the 1950 census, 51,976,357, mostly concentrated along a narrow coastal strip.

History.—It was estimated, at the beginning of 1955, that Brazil would have to face, until the end of the year, obligations totalling U.S. \$850,000,000 and the equivalent of U.S. \$300,000,000 in other currencies, besides foreign currencies needed to pay for ordinary imports. At the same time, Brazil's gold reserves were said to be slightly more than U.S. \$320,000,000, of which U.S. \$160,000,000 were held as security for loans by the federal reserve bank and about U.S. \$40,000,000 by the National City Bank of New York. The country's economic situation was aggravated by the decline of prices and by the smaller sale of the main export commodities (coffee, cotton and cacao).

The finance minister, Eugenio Gudin, tried hard (although not entirely successfully) to avoid further note issues. It was estimated that these issues would total, until the end of the year, about Cr\$ 3,000,000,000, a fourth of the previous year's total. The national budget deficit for 1955 was alarmingly estimated at Cr\$ 14,000,000,000.

On April 5 Gudin resigned as finance minister. He was replaced by José Maria Whitaker. The reasons for the change were mostly political rather than economic or financial. The new minister of finance adopted a policy of gradual return to freedom of exchange and commerce. At the end of the year new foreign exchange regulations were announced which were expected to promote these aims.

The political life of the nation was dominated in 1955 by approaching presidential elections, which were held on Oct. 3.

Early in the year the national convention of the Social Democratic party, the majority party, held in Rio de Janeiro, selected Juscelino Kubitschek de Oliveira, governor of the state of Minas Gerais, as its candidate for the presidency. Meanwhile, top-ranking military chiefs, including leaders of the opposition party, the National Democratic union, had sent President Café Filho a memorandum calling for a solution of the presidential election problem on the basis of an agreement among the leading parties with a view to the presentation of a single "national union" candidate. It appears that the opposition of the military to Kubitschek resulted mainly from the suspicion that he would continue Vargas' policies if elected.

President Café Filho tried to get Kubitschek to withdraw his name in favour of a coalition candidate, but without success.

Area and Population of States and Territories of Brazil

(Estimates published by the Instituto Brasileiro de Geografia e Estatística, in its Boletim Estatístico, No. 49, Jan.-March 1955)

State or territory	Area (sq. mi.)	Pop. (Jan. 1, 1955)	Capital
North			
Acre (terr.)	57,153	135,535	Rio Branco
Amazonas	595,474	561,787	Manaus
Rio Branco (terr.)	97,438	21,766	Boa Vista
Pará	470,752	1,228,839	Belém
Amapá (terr.)	55,489	48,269	Macapá
Guaporé (terr.)	96,986	47,566	Porto Velho
Northeast

Mato Grosso	485,405	576,154	Cuiabá

*Area in dispute between the states of Minas Gerais and Espírito Santo.

The opposition to Kubitschek included members of the National Democratic union, the Liberal party, the Democratic Christian party and some dissidents from the Social Democratic party.

By April the political situation, already tense, was aggravated by the publication in the press of details of an alleged secret agreement between President Café Filho and Gov. Jânio Quadros of São Paulo. Under this agreement, Quadros was to withdraw his intended candidacy in favour of that of Gen. Juarez Távora, the president's chief military adviser. Governor Quadros would receive, in return, the right to designate three members of the president's cabinet and a new president of the Bank of Brazil, besides certain federal loans to the state of São Paulo.

When this agreement became publicly known, it led to the resignation of two cabinet members, the finance minister, Eugenio Gudin, and the transport and public works minister, Col. Rodrigo Otavio Jordão Ramos, as well as of the president of the Bank of Brazil, Clemente Mariani Bittencourt.

The news of this agreement had unfavourable repercussions throughout the country. General Távora was advised to withdraw his name, which he did, in favour of Etelvino Lins, former governor of the state of Pernambuco and leader of the dissident faction of the Social Democratic party.

In the latter part of April the convention of the Brazilian Labour party gathered in Rio de Janeiro to nominate its candidates for the coming elections. The president of the party, João Goulart, was a favourite with most members of the party. He had served President Vargas as minister of labour and was considered responsible by many of the military for the minimum wage increases adopted by Vargas. At once, the minister of war, Gen. Henrique Teixeira Lott, issued a warning that Goulart's nomination for president or vice-president would probably lead to the army's intervention in the elections. Despite this warning, the Brazilian labour party convention unanimously endorsed Kubitschek for president and nominated Goulart for vice-president. (Kubitschek had resigned the governorship of the state of Minas Gerais on April 1.) Meanwhile, General Távora again decided to become a candidate for the presidency, in opposition to Kubitschek. Resigning his position as chief military adviser to President Café Filho, General Távora accepted the nomination by the Democratic Christian party, with Milton Campos for vice-president. Later, Etelvino Lins withdrew his name and many of his followers pledged their support to General Távora.

Other candidates were Adhemar de Barros, former governor of the state of São Paulo, the leader of the Social Progressive party, together with Danton Coelho for vice-president, and Plínio Salgado, former Integralist leader and now the president of the Popular Representation party, without a vice-presidential candidate. The elections of Oct. 3 were held in good order throughout the whole country, and long before all the votes had been counted it was clear that Juscelino Kubitschek de Oliveira had been elected the next president of Brazil with João Goulart as vice-president. They were to take office on Jan. 31, 1956. (See also FOREIGN INVESTMENTS.) (R. D'E.)

Not so clear was the trend of ensuing events. In early November Pres. João Café Filho was granted an indefinite leave of absence by the congress after he suffered a heart attack, and the speaker of the lower house, Carlos Luz, was sworn in to take over for the remainder of the term. After two days, however, he was forced out by the army to forestall a coup by other elements which, it was said, might try to set aside the vote that named Kubitschek president and Goulart vice-president. Nereu Ramos, speaker of the senate, was installed as acting president. Further to complicate the situation, Café Filho attempted to end his sick leave and regain the presidency, but

both houses of congress rejected his demand.

Education.—In 1952 there were 84,254 elementary school units with 5,651,564 pupils; (1954) 2,485 secondary schools with 535,775 pupils; 795 commercial schools with 97,531 pupils; 598 superior schools with 64,645 pupils; and 796 normal schools with 59,521 pupils. There were 11 universities, of which 3 were private (Catholic), 7 state and 1 federal (University of Brazil at Rio de Janeiro).

Finance.—The monetary unit is the cruzeiro (Cr\$), valued at 5 cents U.S. currency, official rate, during 1955, and at 1.48 cents, legal free rate, on Sept. 9, 1955. After Oct. 16, 1953, the official rate was used only for government imports and imports of a few essentials. An auction system was used for the sale of foreign exchange for most private imports. Under this system exchange was allotted to five auction categories according to the essentiality of the goods to be imported, and the rate paid at the auctions had to be added to the official selling rate, and applicable taxes, to secure the effective selling rates. The fluctuating market rate was used for most capital and nontrade transactions.

The 1955 budget as approved by congress called for revenue of Cr\$ 5,482,000,000 and expenditure of Cr\$ 56,497,000,000. The 1956 draft budget called for revenue of Cr\$ 62,674,000,000 and expenditure of Cr\$ 64,528,000,000. Actual government revenue in 1954 was Cr\$ 4,539,000,000; expenditure, Cr\$ 53,661,000,000. The consolidated federal debt on Dec. 31, 1954, was £15,738,540, U.S. \$64,132,595, 32,976,100 French paper francs and 20,372,500 gold francs; consolidated internal debt, Cr\$ 10,451,537,000. Currency in circulation (April 30, 1955) was Cr\$ 50,300,000,000; demand deposits, Cr\$ 106,400,000,000. The cost-of-living index (São Paulo) stood at 228 in July 1955 (1948=100).

Trade and Communications.—Exports in 1954 totalled Cr\$ 42,960,000,000 (including bonuses); imports, Cr\$ 55,239,000,000 (including premiums). Leading exports were coffee (34%), raw cotton (15%), cacao (10%), pine wood (3%) and iron ore (1%). Leading customers were the U.S. (37%), Germany (12%), Argentina (6%), France (6%) and the U.K. (5%); leading suppliers, the U.S. (36%), Germany (10%), the Netherlands Antilles (6%), France (5%), Argentina (5%) and Norway (5%).

Railway mileage (Dec. 31, 1953) was 22,996; in 1953, 328,316,000 passengers and 35,479,000 metric tons of freight were carried. Highway (1951) totalled 38,000 mi.; common roads, 124,000 mi. On Jan. 1, 1954, there were 367,568 automobiles, 324,971 trucks and 27,246 buses. In 1954 Brazilian air lines flew an estimated 68,638,000 mi. and carried an estimated 3,119,500 passengers. According to *Lloyd's Register of Shipping*, the merchant marine had 411 vessels (100 tons and more) aggregating 898,989 gross tons on June 30, 1954. Telephones (Jan. 1, 1955) numbered 679,540.

Agriculture.—Coffee production in the 1954-55 season (preliminary figures) totalled 17,600,000 bags of 132 lb. each; exports in 1954 were 10,918,000 bags, of which 5,672,000 bags went to the U.S. and 771,000 bags to Germany. Preliminary official estimates for other crops in 1954 (in metric tons) included cotton (ginned) 447,295; cacao 151,618; wheat 823,845; maize 7,071,160; rice (rough) 3,448,048; cassava 14,210,390; potatoes 938,594; bananas 201,362,000 (stems); sugar 2,118,378; sisal 82,138; leaf tobacco 134,273; peanuts 159,633; cottonseed 834,575.

Livestock estimates (Dec. 31, 1953) showed 57,626,000 cattle, 1,059,000 horses, 32,721,000 pigs, 16,800,000 sheep and 8,915,000 goats. Forest exports in 1954 included pine wood 485,000 metric tons and cachauba wax 9,000 tons. Rubber production was about 22,300 tons.

Manufactures.—The 1950 census of industry listed 89,086 industrial establishments with 1,256,807 workers and production (1949) valued at Cr\$ 116,747,264,000, of which the food-processing industry accounted for 29%, textile 17%, chemical and drug 8% and metallurgical 7%. Preliminary production figures for 1954 included cement 2,405,625 metric tons; pig iron 1,089,889 tons; raw steel 1,171,893 tons; iron and steel sheets 972,446 tons.

Minerals.—Production in 1954 included coal 2,019,000 metric tons; gold 120,000 fine ounces; crude petroleum 121,600 tons. Production of other minerals (1953) included iron ore 3,617,484 tons (exports 19,1678,000 tons) and manganese ore 231,385 tons (exports 1954: 94,000 tons). Imports in 1954 included coal 468,000 tons; gasoline 2,618,300 tons; fuel and diesel oil 4,262,021 tons. (J. W. Mw.)

Bread and Bakery Products: see BAKING INDUSTRY.

Brewing and Beer. **Sale and Consumption.**—Beer sales in the United States for the fiscal year ending June 30, 1955, totalled 84,456,627 bbl. (31 U.S. gal. each), the fifth highest fiscal year on record. The largest sales total for a fiscal year was 86,992,795 bbl. in 1919.

As a result of the trend toward increased home consumption, packaged beer (in bottles and cans) accounted for 76.7% of all beer sales—a new high. Of packaged beer sales during the 1954 calendar year, 63.2% was in returnable bottles, 5.3% in nonreturnables (no deposit) and 31.5% in cans.

The United States, with 15.9 gal. per capita in 1954, stood eighth in consumption among reporting nations, on the basis of compilations by the Brewers' society, London. Belgium, with 37 gal. per capita, retained its customarily wide lead. The next six nations, in order, were Luxembourg, Australia, New Zealand, the United Kingdom, Denmark and the German Federal Republic.

Taxes.—For the second consecutive year, beer was a \$1.00

00,000-a-year producer of public revenues, through payment of \$744,304,000 in federal taxes at \$9 per barrel, \$198,977,000 in state taxes and an undetermined total in local taxes. This contrasted with the total of \$1,628,933 collected in fiscal 1863, when excise taxes first were applied on beer.

The rate of state taxes was believed by market analysts to have influenced beer consumption in many areas. Wisconsin, Nevada and Michigan, each with a comparatively low state tax, led the states in per capita consumption, in that order. On the other hand, North Carolina, Mississippi and Alabama, each with a relatively high state tax, had the lowest per capita consumption.

Wages.—The census of manufactures report showed for the brewing industry a payroll of \$425,492,000 for 1953, but this figure was believed exceeded in 1954 as a result of wage increases. The 1955 edition of the *Brewers Almanac*, published by the United States Brewers foundation, disclosed that the weekly average earnings for brewery production workers was \$92.80, a new high, as compared with \$71.86 for all manufacturing. The brewery wage represented a five-year rise of \$20.14 per week as compared with \$12.53 for all manufacturing.

Research.—Continuous scientific research on the role of beer in the human diet, possible ways of improving the quality of brewing ingredients and other kindred subjects was carried out at various colleges under the aegis of the Brewing Industries Research institute. A major 1954 development was the conclusion of a Marquette university, Milwaukee, Wis., study that beer may be a useful adjunct to the low-salt diet and may be used advantageously in treating certain cardiac patients.

Safety.—The industry-wide safety campaign, given impetus through the United States Brewers foundation-sponsored contest open to all U.S. breweries, was regarded an important factor in reducing the industry's accident frequency to a new low of 7.9 per 1,000,000 man-hours. This figure, reported by the U.S. department of labour, compared with 35 per 1,000,000 man-hours in 1948, when the safety campaign was inaugurated. (See also LIQUORS, ALCOHOLIC.)

(E. V. L.H.)

Bridge, Contract: see CONTRACT BRIDGE.

Bridges. The world's longest spans of the various types built up to 1955 are listed in the table. There was no change in the table during 1954 and 1955.

World's Longest Spans by Type of Bridge

Type	Bridge	Location	Year Completed	Span
able Suspension	Golden Gate	San Francisco	1937	4,200 ft.
ansporter Bridge	†Sky Ride	Chicago	1933	1,850
antilever	*Quebec	Canada	1917	1,800
eel Arch	Kill van Kull	New York	1931	1,652
rebar Suspension	*Florianópolis	Brazil	1926	1,114

*Railroad bridge.

†Not standing.

United States.—Three huge bridge projects were planned for the near future for New York city at a total cost of \$379,000,000. The first project was a \$204,000,000 suspension bridge across the narrows from Brooklyn to Staten Island with a record-breaking span of 4,400 ft. The second was a lower deck for the George Washington bridge to increase its capacity by 5%. The cost, including work on the approaches, was estimated

at \$82,000,000. The third was a \$93,000,000 suspension bridge between the Bronx and Long Island, paralleling the existing Triborough and Whitestone bridges.

The main span of a highway overpass completed in Jacksonville, Fla., is a 385-ft. steel arch with three ribs. The ribs are slender members and are stiffened by deep tie girders in the floor system.

Sunshine skyway, a 15-mi. chain of causeways and bridges, spanning lower Tampa bay, Fla., was opened to traffic late in 1954. Roadways and hydraulic fill are 10.2 mi. in length. There are 3.8 mi. of prestressed and conventional concrete trestle. The remainder of the bridge consists of a twin-leaf bascule span and 5,621 ft. of steel spans, including a cantilever bridge with a main span of 860 ft. and anchor arms of 360 ft.

California authorized the expenditure of \$1,500,000 to complete engineering work for a new \$30,000,000 bridge to cross San Francisco bay from San Francisco to Bay Farm Island in Alameda.

Substructure for the Tappan Zee bridge, which would carry the New York state thruway over the Hudson river near Tarrytown, N.Y., was completed in 1955. The main piers are novel in the use of buoyant concrete boxes to reduce the load on the pile foundations. The steel spans were scheduled for completion in 1956.

A new \$50,000,000 bridge of cantilever type was planned to cross the Delaware river between northeast Philadelphia and New Jersey. This bridge would be the third major crossing at Philadelphia.

Construction was started in 1955 on the longest highway bridge in the world, a 24-mi. structure across Lake Pontchartrain in Louisiana. The bridge is a low-level structure with bascule spans at the third points of its length. At the centre of each third of the length, the bridge humps to give a 25-ft. vertical clearance. Otherwise the bridge has a 16-ft. vertical clearance. The bridge carries a 28-ft. roadway on two-pile bents 56 ft. apart with precast pile caps. To minimize work at the site, the bridge was being made up of precast full-width, full-length prestressed concrete units 56 ft. long.

The city council of Kansas City, Mo., appropriated \$1,600,000 in late 1954 to start construction of a \$13,000,000 bridge over the Missouri river to the municipal air terminal.

A cantilever highway bridge, 3,655 ft. long, was completed in 1955 over the Illinois river at Beardstown, Ill. It carries a 26-ft. roadway.

Construction was started on a bridge from Galveston to Pelican Island, Tex., 8,400 ft. long, to carry a two-lane highway and a single-track railway. The bridge includes 2,100 ft. of reinforced concrete trestle, 2,100 ft. of prestressed concrete trestle, 3,100 ft. of embankment, 900 ft. of steel-girder trestle and a 200-ft. single-leaf bascule.

A contract was let for the construction of an \$8,000,000 two-leaf bascule bridge over the Willamette river in Portland, Ore. It carries six lanes of traffic and provides an opening of 220 ft.

A highway bridge was completed in 1955 over the Red river at Miller's Bluff, La. It has a total length of more than half a mile and consists of 17 I-beam spans, each 75 ft. long, and five through truss spans, each 360 ft. long.

The longest pipeline suspension bridge in the world was completed in 1955 over the Mississippi river near Grand Tower, Ill. It is 3,690 ft. between anchors and has a main span of 2,150 ft. The pipes were to be 75 ft. above the highest recorded level of the river. The towers are 296 ft. high. One pier is founded 140 ft. below ground surface.

Construction was started late in 1954 on a \$6,800,000 bridge across the Mississippi river at Clinton, Ia. The bridge is 9,557 ft. long with a main span of suspension type, 644 ft. long,

200 FT. ABOVE THE WATER, a bridgeman ascends the cables of the world's longest pipeline suspension bridge—2,150 ft. long—completed across the Mississippi river in 1955

and carries a 26-ft. roadway and two 3-ft. sidewalks.

Construction was started in 1955 on a \$57,000,000 bridge across the Mississippi river at New Orleans, La. The bridge is 2.3 mi. long and includes a cantilever span of 1,575 ft., which is the longest span of its type in the United States and the third longest in the world.

Plans were started in 1955 for a new bridge across the Mississippi river near Helena, Ark.

Two new bridges were authorized in the San Francisco bay area. One was a \$47,000,000 bridge to be built 200 ft. from the existing cantilever bridge at Carquinez straits. It would have two 1,100-ft. cantilever spans. Each bridge would carry one-way

traffic when the project was completed. The other new bridge would be a \$26,000,000 span between Martinez and Benicia.

A \$116,000,000 bridge project was proposed across Puget sound west of Seattle, Wash. The project included a 14,250-ft. concrete floating bridge and a high-level suspension bridge.

Construction was started late in 1954 on a bridge across the Rappahannock river between Middlesex and Lancaster counties, Va., 9,985 ft. long. The bridge includes beam, girder and truss spans. The main channel crossing is a cantilever truss span of 648 ft.

Construction was started late in 1954 on a bridge-tunnel project across Hampton Roads at Norfolk, Va. The bridge portion of the project includes a 3,250-ft. trestle, a 1,450-ft. bridge and a 713-ft. bridge in the north approach. The south approach includes a 6,110-ft. trestle.

A \$4,600,000 bridge, 6,800 ft. long, was approved to cross the Spokane river at Spokane, Wash.

Canada.—The \$10,000,000 Angus L. Macdonald bridge was completed in 1955 across Halifax harbour, linking Halifax and Dartmouth. This was the second largest suspension bridge in Canada, with a main span of 1,447 ft. and a total length of 5,290 ft. The bridge carries a 27-ft. roadway and a 5-ft. sidewalk.

An \$8,000,000 project was started across the Frazer river to connect the mainland with the island on which Vancouver airport is located. A 6,600-ft. bridge across the main channel has the longest plate girders in Canada—three continuous spans of 200 ft., 300 ft. and 200 ft.

Cuba.—A prestressed concrete bridge of 299-ft. span was completed in 1955. Cantilevers 43 ft. at each end, anchored by post tensioned piers, provide relieving stresses that permitted a depth of only 6 ft. 4 in. at midspan. The cross section is box-shaped with three ribs. The bridge carries a 20-ft. roadway and two 4-ft. sidewalks.

India.—A contract was let in 1955 for the construction of the world's longest submersible bridge to cross the Chambal river near Agra. It is 2,434 ft. long with spans up to 143 ft. and is submerged under 27 ft. of water during monsoon floods. The bridge was designed to withstand the shocks of floating debris when the water reaches the decking.

France.—A series of eight prestressed concrete highway bridges was completed over the Nimy-Blaton canal in France. Shallow depth was achieved by cantilevering the ends of the spans past compression struts on piers and pulling down the ends with prestressed cables. The span between compression struts is 190 ft. and the cantilevers are each 15 ft. Six ribs were used, 4 ft. 11 in. deep at the centre.

Japan.—A single-span, spandrel-braced steel-arch bridge linking Nagasaki with Sasebo, Kyushu Island, was completed in 1955 at a cost of about \$1,500,000. The span is 1,042 ft., making the bridge the fourth longest of its type in the world.

Puerto Rico.—The \$2,300,000 Constitution bridge was completed in 1955 over Martin Pena channel at San Juan. It is 1,700 ft. long and carries two 26-ft. roadways and two 6-ft. sidewalks. The bridge consists of a series of three-span continuous units, the largest of which is 72 ft., 120 ft. and 72 ft., several simple spans and one two-span continuous unit. Rolled steel beams were used except for the largest unit which is of plate girder construction.

Venezuela.—A 2,600-ft. bridge over the Rio Chama was opened in 1955 to complete Venezuela's 622-mi. section of Pan American highway. The bridge consists of a series of slend steel arches of deck construction, stiffened by Warren truss between the arch ribs and the deck.

Wales.—A 310-ft. steel-arch span was proposed to replace the world famous suspension bridge over the Conway river, but

1826 by Thomas Telford. The existing bridge is one of the first suspension bridges to be built of wrought iron. The new bridge would have a 31-ft. roadway; the present bridge has a 7.5-ft. roadway. (See also ROADS AND HIGHWAYS.) (D. B. S.)

British Borneo. Under this heading are grouped the colonies of North Borneo (including Labuan Island) and Sarawak and the protected sultanate of Brunei. Languages: various indigenous, Chinese, Malay (lingua franca). Religions: Moslem, various pagan, many Chinese Christians.

North Borneo.—Area: 29,388 sq.mi. (including Labuan, 35 sq.mi.). Pop.: (1951 census) 334,141, including 243,009 Borneans, 74,374 Chinese; (1954 est.) 365,000. Chief towns (pop., 1951): Jesselton (cap.) 11,704; Sandakan (port) 14,499. Governor in 1955, R. E. Turnbull.

Sarawak.—Area: 47,069 sq.mi. Pop.: (1947 census) 546,385; (1954 est.) 605,000, including 213,200 Sea Dayaks (Ibans), 7,500 Land Dayaks, 32,300 other indigenous tribespeople, 167,000 Chinese, 137,700 Malays and Melanau. Chief towns (pop., 1954 est.): Kuching (cap.) 45,500; Sibuan (river port) 12,000; Miri (oil fields) 10,600. Governor (and high commissioner for Brunei) in 1955, Sir Anthony Abell.

Brunei.—Area: 2,226 sq.mi. Pop.: (1947 census) 40,670; (1954 est.) 55,000 (Malay 41%, Melanau 5%, Sea Dayak 2%, other indigenous 25%, Chinese 24%, other Asian 2%, European 1%). Chief towns (pop., 1953 est.): Brunei Town (cap.) 15,700; Seria (oil fields) 12,000. Sultan, Omar Ali Saifuddin; British resident in 1955, J. O. Gilbert.

History.—A. T. Lennox-Boyd, United Kingdom secretary of state for the colonies, visited North Borneo, Sarawak and Brunei in Aug. 1955. During the year an agreement providing for the recruitment of labour for North Borneo from the Philippines was signed between the two countries, and in both North Borneo and Sarawak an extensive rubber replanting program was undertaken, a rise in rubber prices stimulating production. North Borneo expected to exceed the previous year's exports of 17,114 tons. A promising new oil strike was made in Brunei near the existing Seria oil field.

In June the fifth meeting of the Sarawak-North Borneo-Brunei international conference was held at Jesselton under the chairmanship of Malcolm MacDonald, then U.K. commissioner general in southeast Asia. Piracy appeared to be decreasing throughout the area. (J. J. Ty.)

Education.—(1953) *North Borneo*: primary schools 228; secondary 3 and 13 schools with secondary forms; 1 vocational and 1 teachers' training school; pupils (all schools) 24,105. *Brunei*: primary Malay vernacular 34, pupils 2,679; primary Chinese 7, pupils 1,727; primary English 6 (2 with secondary forms), pupils 1,511; 1 vocational school, pupils 5. *Sarawak*: All schools 512, pupils 49,072 (of which, in 1952, 226 schools with 28,668 pupils were run by Chinese management committees).

Finance and Trade.—Monetary unit: Malayan dollar, valued in 1955 at 2.66 U.S. cents.

	North Borneo	Brunei	Sarawak
Revenue (1953 actual)	M\$ 28,507,471	M\$ 99,367,000	M\$ 39,220,000
Expenditure (1953 actual)	M\$ 33,103,833	M\$ 23,845,000	M\$ 35,629,000
Imports (1954)	£ 8,700,000	£ 13,000,000	£ 46,700,000
Exports (1954)	£ 9,080,000	£ 31,900,000	£ 49,700,000

Principal exports (1954): *North Borneo*: rubber 11,800 tons, copra oil equivalent, including re-exports 8,400 metric tons, timber 9,836,000 cu.ft. *Sarawak*: crude oil 2,915,000 tons, refined oil 1,771,000 tons, pepper (1953) 8,997 tons, rubber 6,750 tons; timber 3,727,000 cu.ft. *Brunei*: crude oil (production) 4,712,000 tons (of which 4,707,000 tons exported to Sarawak for refining), natural gas 2,059,000,000 cu.ft.

British Columbia. British Columbia, Canada's Pacific coast province, has an area of 366,255 sq.mi., of which 6,976 sq.mi. are water. It is the third largest of Canada's ten provinces and is bounded on the west by the Pacific ocean and the Alaskan panhandle; on the east by the province of Alberta; on the south by the 49th parallel; and on the north by the 60th parallel.

The population on June 1, 1955, was estimated to be 1,305,000

(1951 census 1,165,210). The 1951 census indicated there were 793,471 urban dwellers and 371,739 rural dwellers. This census indicated that 66% of the population was of British extraction. The chief centres and their 1954 estimated populations were: Vancouver, 396,000; Victoria, the capital, 51,331; New Westminster, 35,000. The metropolitan population of Vancouver and Victoria were estimated to be 624,000 and 121,000, respectively.

History.—In the third session of the 24th parliament of British Columbia, Jan. 25 to March 15, 1955, the following measures were among those passed: an act to provide for the establishment and maintenance of provincial child guidance clinics; an act setting up a separate department of highways; an act to provide for the establishment and maintenance of provincial mental health centres; an act respecting the regulation of oil and gas pipelines; an act respecting the public services medical plan; an act providing for a separate department of public works; an act amending the public schools act; an act amending the Assessment Equalization act of 1953; an act amending the University Endowment Lands Administration act; and an act to facilitate the construction of extensions of the Pacific Great Eastern Railway company.

In January, the Social Credit government announced the following as its program: a new department of highways with a new portfolio added to the cabinet; completion of the northern extension of the Pacific Great Eastern railway; more money for bridges under the toll authority; a new girls' industrial school; a \$10,000,000 ten-year building program for the University of British Columbia; a new education finance plan; a medical plan for civil servants; a new municipal aid plan; laws governing co-operatives to be overhauled; an experimental program to treat narcotic addicts.

In April, Premier W. A. C. Bennett, attending a dominion-provincial conference, called upon the federal government to become a full partner in a vast works program. In May it was announced that the government was awaiting detailed plans of the \$270,000,000 Frobisher development in northern British Columbia. In July, Premier Bennett announced an \$11,381,000 reduction on the province's net debt. In September it was announced that F. McKenzie Ross, Vancouver industrialist and businessman, would succeed Clarence Wallace as lieutenant governor on the expiry of his term in October.

Members of the provincial executive council or cabinet and their portfolios at Oct. 1, 1955, were: W. A. C. Bennett, premier, finance, and president of the council; W. D. Black, provincial secretary and municipal affairs; R. W. Bonner, attorney general; R. E. Sommers, lands and forests, and mines; W. K. Kiernan, agriculture; P.A. Gaglardi, highways; W. R. T. Chetwynd, railways, trade and industry, and fisheries; L. Wicks, labour; E. C. F. Martin, health and welfare; R. G. Williston, education; W. N. Chant, public works.

Education.—During the school year ending June 30, 1954, 210,174 students were enrolled, in the elementary, elementary-senior-junior-high (147,392), superior (2,148), junior, junior-senior and senior high (60,634) schools of the province. Teaching staffs comprised 7,574 teachers as follows: in the elementary, elementary-senior-junior high, 4,856; superior 89; junior, junior-senior and senior high 2,629.

Higher education is provided by the University of British Columbia, Vancouver, a provincially endowed institution, two teacher training schools located at Vancouver and Victoria, a vocational institute at Vancouver and a junior college at Victoria.

The total net cost for the enrolment of 210,174 in 1953-54 was \$70,791,844. The deputy minister and superintendent of education was H. L. Campbell.

Communications.—The total highway mileage as of March 31, 1954, excluding the Alaska highway, was 22,797 mi., of which 11,693 mi. were surfaced, 9,469 mi. were improved earth and 1,635 mi. unimproved earth.

Railway mileage as of Dec. 31, 1954, was 4,448 mi. of main-line track and 1,238 mi. of sidings. During 1954 approximately 8,810,720 tons of cargo were loaded at British Columbia ports on vessels destined to foreign countries, while 2,115,586 tons of cargo received from foreign countries were unloaded at local ports. In 1953, the total number of telephones was 347,750, including 154,373 on automatic switchboards.

During 1954, there were 283,641 passenger cars and 93,836 commercial vehicles registered within the province.

Table I.—Economic Activity in British Columbia

	Unit	1954	1953	1955 Preliminary Estimates
Agriculture				
Total value of production	\$	142,000,000	137,388,728	145,000,000
Livestock	\$		15,380,000	
Poultry products	\$		23,789,000	
Dairy products	\$		28,377,000	
Fruits and vegetables	\$		32,695,970	
Field crops	\$		29,582,000	
Miscellaneous	\$		7,555,758	
Fisheries				
Total value of products .	\$	69,400,000	66,260,000	65,000,000
Pack of canned salmon	cases	1,750,000	1,821,269	
Forestry				
Total value of production	\$	528,022,783	512,289,000	560,000,000

Consumption of electric power	000 kw.hr.	5,209,683	4,897,335	5,900,000
Construction building permits	\$000	164,749	144,049	210,000
Bank debits	\$000	11,956,325	11,786,823	12,350,000
Index of employment 1949=100		103.0	108.4	106.0
Personal income	\$000	1,836,000	1,778,000	1,920,000

Table II.—Principal Manufacturing Industries of British Columbia

Industry	Selling value of factory shipments	
	1953	1952
Sawmills	\$ 323,474,522	\$ 316,723,587
Pulp and paper	138,883,093	125,290,032
Fish processing	65,726,800	57,590,974
Veneers and plywoods	56,503,885	42,176,834
Slaughtering and meat packing	53,415,699	54,182,549
Sash, door and planing mills	47,658,772	46,289,457
Petroleum products	40,562,462	37,818,297
Miscellaneous food preparations	40,172,603	35,600,308
Fertilizers	35,156,537	32,475,077
Shipbuilding	32,548,906	30,643,942
Total, all manufacturing industries	\$1,366,823,690	\$1,332,481,862

Finance.—On Feb. 4, 1955, W. A. C. Bennett, minister of finance, reported that revenue collected for the fiscal year ended March 31, 1954, was \$169,034,000; expenditures were \$165,624,000; the net debt at Dec. 31, 1954, was \$139,370,142, a decrease of \$16,785,532 from the preceding year. Anticipated revenues including surpluses were \$194,522,469 and expenditures \$212,059,000, including expenditures for hospital insurance and capital out of income for the fiscal year ending March 31, 1956.

Agriculture, Fisheries, Mining, Forestry.—Preliminary provincial department estimates indicated that the primary industries, with the exception of forestry which showed a moderate increase, remained at about the same levels as in the previous year. The trade situation with the easing of world tensions and the increase in the economic health of most European countries was improved as far as British Columbia products were concerned. Perhaps the highlight of the development related to basic industries was the huge developments in the pulp and paper industry in British Columbia. Prices remained stable, but wages and employment increased so that real income was higher than in the previous year.

Manufacturing.—One of the highlights of British Columbia's economy during 1954 and 1955 was the development of its secondary industries.

Preliminary statistics relating to the manufacturing industries of the province indicated that the 1954 net value of production would reach an all-time high, and that the 1955 figures would reach the highest in British Columbia's history. Considerable exploratory work was done in the Peace river area for gas and oil possibilities. The aluminum company located at Kitimat which poured its first ingots in 1954 was expanding its facilities to take care of increased production. It would appear that 1955 was British Columbia's greatest year as far as economic and business activity was concerned. (G. T. H.)

British Commonwealth: see COMMONWEALTH OF NATIONS.

British East Africa. This term is used to include Kenya, colony and protectorate; Somaliland Protectorate; Tanganyika, trust territory; Uganda, protectorate; and Zanzibar, protected island sultanate.

The East Africa high commission, comprising the governors of Kenya, Tanganyika and Uganda, administers taxation, development and research, transport and other central services in these territories, and has power to legislate, with the advice and consent of the East African central legislative assembly. Governors (Dec. 31, 1955): Kenya, Sir Evelyn Baring; Somaliland,

T. O. Pike; Tanganyika, Sir Edward Twining; Uganda, Sir Andrew Cohen. Buganda (protected African kingdom within Uganda): kabaka (king), Edward Mutesa II; katikiro (chief minister), Mikaeri Kintu; British resident, C. A. L. Richards. Zanzibar: sultan, Khalifa bin Harub; British resident, H. S. Potter. East Africa high commission: chairman, Sir Evelyn Baring; administrator, A. M. Bruce Hutt.

Territory	Area (sq.mi.)	Pop. (1954 est.)	Chief towns (with pop., latest est.)

*1948 census.		†1951 est.	‡1952 census.

History.—The 19th and 20th meetings of the East Africa high commission were held in March and Sept. 1955 in Nairobi, and the central legislative assembly met in the same months. At its September meeting the assembly authorized a further loan of £5,000,000 for East African railways and harbours. At its earlier meeting the estimates for the nonself-contained services for the year 1955–56 were presented and approved. The finance member put the total estimated expenditure at £4,834,406, an increase of £326,423 over the previous year.

The commissioner for transport negotiated a loan of £8,500,000 from the International Bank for Reconstruction and Development. The loan, repayable over 20 years, was to be used in connection with the East African railways and harbours administration's £60,000,000 postwar development program.

Kenya.—Militarily, 1955 brought the Mau Mau near to collapse. The improved circumstances were brought about by a changed attitude on the part of the African population, who saw with greater clarity that Mau Mau was doomed, as well as by the unremitting attacks of the security forces. An indication of the former was the part played by 8,000 women in operations against gangs in south Nyeri, where terrorism had previously been kept alive with female assistance. But optimism that a violence was over was shaken by the murders of Geoffrey Danby and Christopher Twohey, two British schoolboys killed by a gang near Nairobi on April 21. Several terrorists were later executed for the crime.

In January new surrender terms were offered by the government, safeguarding from prosecutions for past offenses Mau Mau who gave themselves up. This move was bitterly opposed by certain sections of the European settler population. The terms were withdrawn in July, by which time there had been a considerable number of surrenders, though not on the scale hoped. Meanwhile, however, attention again had been focused on the possibility of a mass surrender through new negotiations, but the Mau Mau failed to respond, probably because of the intransigence of their few remaining leaders, above all of the elusive Dedan Kimathi. On the failure of the mass surrender plan, Maj. Gen. G. W. Lathbury, who took over as commander-in-chief from Gen. Sir George Erskine in May, at once intensified military operations.

Finance also remained an important problem and, despite additional taxation, the fourth budget in three years showed an estimated deficit for 1955–56 of more than £13,000,000. Development throughout the country was not allowed to suffer, however; a new plan was published, reviewing the territory's requirements under existing conditions for the period ending 1960 and providing for a total expenditure of about £24,000,000. In August the governor opened the Tana river hydroelectric scheme, designed to supply Nairobi with power.

Politically the colony had a quieter year than in 1954. T

committee set up that year by the European electors during a political truce issued a report in Feb. 1955 containing constitutional recommendations which included a "cross bench" consisting of the nominated government members, entitled to vote freely except on a vote of confidence in the government; the abolition of the executive council; and some measure of federation of East African territories in consultation with the Federation of Rhodesia and Nyasaland. A new European organization appeared called the "Kenya guild," which admitted no Asians but declared its aim as co-operation between Africans and Europeans. In April the Kenya Indian congress, in a policy statement, called for equal opportunity on the land for all races, and in June the European elected members of the legislature proposed increased African representation, more specifically for tribes loyally supporting the government during the emergency. The African members called for another African minister. In June the ban on African political organizations was lifted.

Somaliland.—An Anglo-Ethiopian agreement, signed Nov. 29, 1954, took effect Feb. 28, 1955. Under it, British military administration was withdrawn from parts of Ethiopia bordering Somaliland Protectorate and known as the Haud and Reserved Areas. The protectorate government was to receive considerable administrative powers and facilities when Somali tribes were exercising existing grazing rights in these areas. But a deputation of Somalis went to London to protest, and in May a petition was sent to the United Nations for an examination of the matter by the International Court of Justice. In April an order in council allowed for the setting up of a legislative council in the protectorate.

Tanganyika.—The newly enlarged legislative council, approved the year before, met in April and Sept. 1955. There were 12 members on the government side and 30 unofficial members (10 each from European, Asian and African residents); for the first time women occupied some of the unofficial seats. In local government Mafia Island followed the lead of Newala district and established a multiracial local district council, while in the Southern Highlands province the first meeting of a provisional county council took place. Widespread criticism was levelled at the publication in the U.S. of the report of the United Nations visiting mission of 1954, before publication in Tanganyika had enabled the government to prepare replies. Particularly in the public mind was the section calling for a timetable based on the alleged ability of Tanganyika Africans to be self-governing in less than 20 years. The chairman of the mission, however, disagreed with much of the report and subsequently the drafting committee of the trusteeship council published its own report which in effect vindicated British policy in the territory.

The country remained free from Mau Mau activities, but one armed gang from Kenya entered the Northern province and slaughtered Masai cattle before recrossing the border.

The Tanganyika Agricultural corporation, set up in 1954, came into formal existence and a Dutch firm began experiments with cocoa growing, hitherto untried in the country. A new 20-kw. radio transmitter for up-country broadcasting gave good results.

The governor's term of office was extended until June 1958.

Uganda.—Political preoccupations did not check the country's economic progress and the 1955 coffee crop was about 50% higher than before. But the main focus for attention was the return of the kabaka of Buganda from England two years after he had been sent there on his deposition, and on the steps leading up to it. The constitutional proposals put forward by a Buganda committee and by Sir Keith Hancock, the University of London colonial expert, in 1954, to regulate the kabaka's position and to resolve the separatist tendencies of his area,

MUTESA II, the kabaka of Buganda, British East Africa, shown on his throne after returning in 1955 from two years of exile in England

had been agreed by the governor of Uganda and by the United Kingdom government; but the Buganda lukiko (parliament) had decided late in 1954 to appoint its own committee for further consideration of the proposals.

In April this committee recommended acceptance of the proposals and on May 9 the lukiko accepted them with certain modifications, sending a delegation to London to discuss the early return of the kabaka. A principal task of this delegation and of the U.K. government was to devise a method whereby the kabaka could sign the solemn agreement upon which his return depended, and in July A. T. Lennox-Boyd, the U.K. secretary of state for the colonies, informed the house of commons that a means had been found whereby it would be possible for the kabaka to return to Buganda within six weeks of the appointment of Buganda ministers and representatives to the protectorate legislature. Meanwhile the governor was authorized to bring into effect the central legislature's reforms approved in Nov. 1954, and in August the ministerial system was introduced, with six official ministers and five drawn from the public. Some African opposition was voiced to Asian representation in the new system.

Buganda did not delay in playing its part. While revising its own constitutional system, it elected representatives to the central legislature and by the time the kabaka returned to his country, Buganda for the first time had advanced from the attitude which previously had kept it largely isolated from the rest of the territory. A point of significance was that although the somewhat extreme Uganda National congress made no showing in elections for Buganda's local ministerial system, four of the

five representatives elected from Buganda to the central legislature were members of the congress.

The kabaka, together with many guests from Great Britain, arrived in Uganda in mid-October, his return being greeted with enthusiasm and being clearly regarded in some quarters as a great victory for African sentiment.

The Bunyoro and Busoga areas also came into the news, the former with the signing of a new agreement, regulating the position of the omukama (African ruler), to replace that of 1933; and the latter with some instability in its local government and warnings from the administration that it was slipping behind the rest of the country.

Zanzibar.—The 1955 estimates budgeted for a surplus of £31,000, the clove crop being only average at an estimated 8,545 tons. A revised £1,250,000 development plan for 1955-56 was approved. An all-communities effort towards a King George VI memorial raised £20,000 for a new boys' secondary school in Zanzibar town. The local fishing industry went ahead, and a loan fund was established to help fishermen purchase powered craft.

In October the British resident announced proposals, for debate in the legislative council, to give unofficial opinion more effect in forming government policy and to develop the position of the sultan as a constitutional monarch presiding over a privy council: the aim was that Zanzibar should achieve self-government within the commonwealth by appropriate stages.

(J. J. Ty.)

Finance and Trade.—Monetary unit: East African shilling, divided into 100 cents, valued at parity with the shilling sterling and at 14 cents U.S.

Territory	Revenue (1954-55 est.)	Expenditure (1954-55 est.)	Imports (1954)	Exports (1954)
Kenya	£21,770,554	£29,755,078	£60,100,000	£22,800,000
Somaliland*	995,998	1,053,720	2,360,000	1,210,000
Tanganyika	18,753,340	18,722,450	31,962	37,795
Uganda	18,961,765	18,903,780	25,200,000	41,000,000
Zanzibar†	2,783,235	1,789,025	5,380,000	5,940,000

*1953-54 actual; revenue includes grant-in-aid. †1953 actual.

Principal exports: *Kenya*, coffee, sisal, hides and skins, wattle bark extract, sodium carbonate, pyrethrum; *Somaliland*, hides, skins, gums, livestock, fish; *Tanganyika*, sisal (1954) £10,902,100, coffee (1954) 19,600 metric tons, cotton, diamonds, hides; *Uganda*, coffee (1954) 35,200 tons, sisal, cotton, hides and skins, tea (1954) 500 tons; *Zanzibar*, cloves and clove oils, coconut oil.

British Guiana.

A British colony in northeast South America, British Guiana lies between Venezuela, Brazil and Surinam. Area: 82,997 sq.mi. Pop.: (1946 census) 375,701; (1953 est.) 465,420, including about 207,000 East Indians, 162,700 Negroes, 49,100 mixed, 17,700 Amerindians, 12,700 Europeans (two-thirds, Portuguese). Language: English; various East Indian. Religion: Christian 60%; Hindu 30%; Moslem 8%. Principal towns (pop., 1952 est.): Georgetown (cap.) 86,412; New Amsterdam 12,826. Governors in 1955, Sir Alfred Savage and (from July 23) Sir Patrick Renison.

History.—Sir Alfred Savage resigned the governorship of British Guiana in 1955 because of ill-health. The nominated legislature continued in office throughout the year. A private member's motion approving the principle of federation and advocating further study by the government was passed by 21 votes to 6 in the legislature after every member had spoken. Guianese delegates appeared before the prefederal commissions in order that the way might be kept open for the eventual participation of British Guiana, and the government information services took vigorous steps to acquaint the populace with the issues involved. A. H. Marshall, city treasurer of Coventry, inquired into the system of local government and in his report made far-reaching recommendations for reform.

Expenditure in the development budget was estimated at B.W.I. \$19,000,000. The Credit corporation, at the end of the

first year of its operations, had advanced about B.W.I. \$4,500,000 in loans, of which B.W.I. \$2,500,000 were for housing. U.S. technical aid was increased and at mid-1955, 16 officials of the Foreign Operations administration were in the colony.

Andrew Dalgleish paid a visit to the colony on behalf of the British Trades Union congress, which made a grant of £3,000 to the trade unions of British Guiana. In August a conference of sugar and plantation workers met in Georgetown under the auspices of the International Confederation of Free Trade Unions. A split occurred in the People's Progressive party, which was in power when the constitution was suspended in 1953: one faction was headed by Cheddi Jagan and the other by L. F. S. Burnham.

The 1955 sugar crop was forecast at 258,000 tons, a record. In 1955 an initial shipment of jute was made from the trial cultivation. Columbite prospecting was suspended, but deposits of monazite were found in the Rupununi. As a result of an outbreak of foot-and-mouth disease in Brazil, cattle in the Rupununi had to be evacuated from the border area and a protective fence was erected. The government acquired the business of British Guiana Airways. New studios erected for Radio Demerara were opened by the governor.

(R. H. Y.)

Education.—(1953) Government and aided schools: primary 287, pupils 84,091, teachers 1,973; secondary 4, pupils 1,511 (excluding private schools with about 6,000 pupils); vocational 3, pupils 993; teachers training college, students about 40.

Finance and Trade.—Monetary unit: British West Indian dollar, value at 58.33 U.S. cents. Budget (1954 est. in British West Indian dollars) revenue \$31,809,105; expenditure \$31,779,617. Foreign trade (1954) imports £16,700,000; exports £17,800,000. Principal exports: sugar, bauxite, rice, rum, diamonds, timber, molasses. Production (metric tons 1954): sugar 261,000; bauxite 2,311,000.

British Honduras.

A British colony in Central America, British Honduras is bounded by Mexico (north and northwest) and Guatemala (west and south). Area: 8,867 sq.mi. Pop.: (1946 census) 59,220, including 22,693 Negroes, 18,360 mixed, 10,030 Amerindians (Maya); (1953 est.) 78,000. Languages: English; Spanish; Indian dialects. Religion: mainly Roman Catholic. Chief towns: Belize (cap. (1953 est., 27,500); Stann Creek (1950 est., 3,500); Corozal (1950 est., 2,500). Governors in 1955: Sir Patrick Renison and (from Aug. 16) Colin Thornley.

History.—The quasi-ministerial system of government in British Honduras came into effect on Jan. 1, 1955, with the appointment by the governor of three elected members of the executive council as members for natural resources, social services and public utilities, respectively. This gave them limited responsibilities for certain departments. In August, following the request of the majority party (the People's United party) for more authority to ensure adequate development and to solve unemployment problems, the then acting governor added the responsibility for industrial relations, labour and local government to those of the member for social services; and that for development concessions to those of the member for natural resources. In May the elective principle for municipal elections was extended to the remaining four of the six districts in the country. This replaced the old system of voting based on income and property qualifications. The municipal councils became partly elected for the first time, with a majority of elected members.

Part iii of the development plan (1955-60), which provided for agricultural, forestry and educational development, came into operation during the year with funds provided by the United Kingdom government under the Colonial Development and Welfare act. Experts in housing and community development from the U.S. International Cooperation administration visited the country for several months and helped the government to establish the country's first aided-self-help housing project.

Hurricane "Janet" virtually destroyed Corozaal at the end of September.

(A. L. A.)

Education.—Schools (1953): grant-aided primary 95 (including 60 controlled by Jesuit missions), pupils 12,690; independent primary 27, pupils 1,041; secondary 5, pupils 964; technical high school, pupils 65. **Finance and Trade.**—Monetary unit: British Honduras dollar, valued in 1954 at 70 cents U.S. Budget (1955 est.): revenue (including grants) £4,842,600; expenditure \$BH4,826,100. Foreign trade (1954): imports \$850,000; exports £1,810,000. Principal exports: timber, chicle, citrus fruits and juice and copra.

British Malaya: see MALAYA, FEDERATION OF; SINGAPORE.

British Somaliland: see BRITISH EAST AFRICA.

British South African Territories. Basutoland (colony), an enclave within southeastern South Africa; Bechuanaland protectorate, north of the Union; and Swaziland (protectorate), between Transvaal and Mozambique, are generally referred to as the High Commission Territories in South Africa.

	Area (sq.mi.)	Population (1946 census) (1954 est.)	Capital (with est. pop.)
Basutoland	11,716	563,854	588,000
Bechuanaland Prot. approx.	275,000	296,310	295,000
Swaziland	6,705	185,215	212,000

Administrative headquarters are at Mafeking, Cape Province, Union of South Africa.

Population is mainly African; the most important tribe is the Basutuan Bamangwato (pop. 100,987) with its capital at Maseru (15,935). Europeans (1946): Basutoland 1,689; Bechuanaland 2,379; Swaziland 3,201. Religion: Christian (Basutoland [1946] 345,986); various indigenous. High commissioner since 1955, Sir John Le Rougetel. Resident commissioners: (Basutoland) E. P. Arrowsmith; (Bechuanaland) W. F. Mackenzie; (Swaziland) D. L. Morgan.

History.—During 1955 an appeal court for the High Commission Territories was constituted.

Basutoland.—The report on native administration by Sir Harry Moore evoked considerable opposition. The tribal chiefs and the people declined to accept any diminution in the status and powers of chiefs. As a result an uneasy situation prevailed throughout 1955.

Bechuanaland.—The Conservative government returned to power in the United Kingdom in May 1955 renewed the permanent exile of Seretse Khama, chief-apparent of the Bamangwato. See Colonial Reports, *Bechuanaland 1953; High Commission Territories: Economic Development and Social Services*, Cmd. 9580 (both H.M.S.O., London, 1955).

Education.—Schools, with enrolment in parentheses (1954):

Territory	Primary	Secondary	Vocational	Teacher training
Basutoland				
African and coloured . . .	930 (101,889)	7 (999)	2 (105)	6 (289)
European . . .				
Bechuanaland				
African and coloured . . .	147 (19,992)	4 (188)	...	1 (54)
European . . .				
	10 (approx. 290)			
Swaziland				
African and coloured . . .	228 (18,201)	
European . . .	8 (815)			

Finance and Trade.—Monetary unit: South African pound; £ (S.A.) £1 sterling = U.S. \$2.80.

	Budget (1953-54 actual)		Foreign trade, 1954	
Territory	Revenue	Expenditure	Imports	Exports
Basutoland	£1,285,991*	£1,317,857*	£2,612,007	£1,954,105
Bechuanaland	£1,016,759†	£1,015,005†	£2,053,423	£2,423,683
Swaziland	£1,150,872†	£990,651†	£2,386,332	£3,134,462

1954-55 revised estimates. †Including development and welfare grants.

Principal exports: *Basutoland*: wool, mohair, sorghum, hides and skins, livestock; *Bechuanaland*: livestock, dairy produce, hides and skins, gold (1953, 34 kg.); *Swaziland*: asbestos (1953, 27,300 metric tons), livestock, tobacco, cottonseed, rice, tin, wattle bark extract.

British West Africa. This term covers the following British territories in West Africa: Gambia, colony and protectorate; Gold Coast, colonies and protec-

torate, with which Togoland, under United Kingdom trusteeship, is administered; the Federation of Nigeria (technically a colony and a protectorate, together with Cameroons under United Kingdom trusteeship; but administered as four units with federal capital area); Sierra Leone, colony and protectorate. Areas, populations and chief towns are given in the accompanying table.

	Area (sq.mi.)	Population (latest est.)	Chief towns with populations
Gambia	4,003	290,000*	Bathurst (cap., 19,602†)
Gold Coast	79,802	4,619,000†	Accra (cap., 135,926§), Kumasi (59,420§), Sekondi-Takoradi (44,557§), Cape Coast (23,346)
Togoland	13,041		Lagos (fed. cap., 272,000); regional caps.—Ibadan (459,196), Kaduna (51,635), Enugu (63,000), Buea (c. 15,000); other cities—Ogbomoso (140,000), Kano (130,000), Oshogbo (123,000), Ife (111,000), Iwo (100,000)*
Fed. of Nigeria (incl. Cameroons trust)	373,250	31,700,000	Freetown (cap., 64,576§)
Sierra Leone	27,926	2,040,000	

*1953 est. †1951 census. ‡1955 est. §1948 census. ||1954 est. ¶1952-53 census.

Governors (Dec. 31, 1955): Gambia, Sir Percy Wyn Harris; Gold Coast, Sir Charles Arden-Clarke; Sierra Leone, Sir Robert Hall. Governor-general, Federation of Nigeria, Sir James Robertson. Prime minister, Gold Coast, Kwame Nkrumah. Chief minister, Sierra Leone, M. A. S. Margai. Asantehene (king) of Ashanti (Gold Coast), Otumfuo Osei Agyeman Prempeh II.

History.—*Gambia.*—At the end of 1954, as a result of increased food production, particularly of rice, there was for the first time for a number of years no seasonal shortage of food in the protectorate. The price of peanuts, of which 60,000 tons were cropped, was fixed at £32 a ton, but as world prices fell below this the Oilseeds Marketing board sustained a heavy loss from the stabilization fund.

Gold Coast.—Political interest during 1955 centred in the conflict between the Convention People's party (C.P.P.) and the National Liberation movement (N.L.M.), which, supported by the Asanteman council of Ashanti, advocated a federal constitution for the Gold Coast when independent. In Dec. 1954 the government expressed the belief that the federal form of government was unsuitable, but offered to provide opponents of it with an opportunity for studying proposals for regional councils. This was refused. Riots occurred in January in Ashanti and the carrying of offensive weapons was proscribed. In March 1955 the Northern People's party supported the Ashanti demand for a review of the constitution before independence. In April the assembly adopted a government motion to appoint a select committee on the federal constitution and on a second chamber. The motion went through in the absence of opposition, who had walked out.

After further rioting in May a curfew was imposed for a time in Kumasi. In July a select committee reported that full federation was impracticable, but recommended regional bodies and declared against a second chamber. In the same month an N.L.M.-supported candidate won a by-election in Ashanti, in a constituency previously held by the C.P.P.; and the asantehene held court to receive the congratulations of the chiefs. In August the assembly adopted the select committee's report, requested the government to consider the establishment of regional councils and to define their functions, and approved the invitation of an expert to advise. In September some opposition parties in the south (Colony) united to join N.L.M.

At the assembly budget session in February the finance minister, K. A. Gbedemah, announced a budget of £63,000,000, including £24,000,000 for Tema harbour and other development projects. As of the end of July control of the civil service passed to the local public service commission, and all overseas officers had to choose between joining the local service and retiring with compensation. Out of 771 officers entitled to leave, only 18%, representing 5% of senior officers, elected to go.

In August a UN mission visited Togoland to study methods of ascertaining the inhabitants' wishes on the future status of their territory.

Nigeria.—In the elections to the federal house of representatives in Nov.-Dec. 1954 the Northern People's congress (which won a majority in the Northern region) and the National Council of Nigeria and the Cameroons (which won majorities in the Eastern and Western regions) were returned as the two strongest parties.

The composition of the federal council of ministers was announced in Jan. 1955. The portfolios were now: transport, works, communications and aviation, land, mines and power, research and information, social services, trade and industry, labour and welfare; and there were two ministers without portfolio.

Soon after his arrival in June the new governor-general, Sir James Robertson, toured the regions. In the same month a report on the public services by L. H. Gorsuch was published. It recommended, *inter alia*, a reorganization of the public services and greater inducements to overseas officers to serve in Nigeria. The need of the services of such officers had been acknowledged by all Nigerian governments and by the colonial secretary. The Gorsuch recommendations were later accepted, with certain exceptions.

During the year the federal government and all regional governments established Nigerians in London as their commissioners.

Sierra Leone.—The reports of the Fulton and Keith-Lucas commissions on education and electoral reform were published toward the end of 1954. The former recommended that secondary technical education be developed, that certain steps be taken to overcome the shortage of trained teachers, that Fourah Bay college (now dependent for degrees on Durham university, Eng.) should eventually become a full university college, and that the educational program should be slowed down rather than reduced if funds proved insufficient in five years' time. These recommendations were accepted in principle. The electoral reform commission, whose recommendations were accepted with modifications, proposed that universal adult suffrage be reached by 1961 in two stages, that paramount chiefs should continue to sit on district councils *ex officio*, and that they should not vote or be candidates but be represented in the legislative council in some manner to be decided.

In Feb. 1955 labour relations, which were normally good, suffered a setback when a strike for more pay led by the Artisan and Allied Workers' union and the Road Transport Workers' union resulted in riots in Freetown and 18 deaths. An inquiry commission under Sir John Shaw strongly condemned Marcus Grant, general secretary of the former union, and found that the force used by the military and the police was justified. The government declared its intention of making the police force more effective and announced changes in the wage negotiating machinery. A general increase in wages was awarded in June with effect from Feb. 1.

In June a government delegation led by the chief minister met the United Kingdom colonial secretary to discuss the diamond industry. The growth of illicit diamond digging and trading was causing a loss of government revenue and was a serious threat to law and order. Negotiations with the Sierra Leone Selection Trust, Ltd., led in September to an agreement on the revision of the Selection trust's monopoly rights in exchange for £1,500,000 compensation, and the government stated its intention of introducing a system of licensing African digging. The legislative council approved the agreement in principle at the end of September.

The chief minister in July invited the expression of views on

the constitutional changes that might be appropriate when the five-year term of the legislative council expired in Nov. 1955 (W. H. Is.)

*1955. †Including Cameroons.

Main exports: *Gambia*, peanuts (36,900 tons, 1954); *Gold Coast*, cocoa (214,000 tons, 1954), gold, diamonds, manganese, bauxite; *Nigeria*, peanuts (428,000 tons, 1954), cocoa (98,000 tons, 1954), hides (89,400 tons, 1954), palm oil and kernels, cotton, timber, bananas; *Sierra Leone*, palm kernels, iron ore, diamonds, ginger.

British West Indies.

Under this heading are treated matters of common concern to Jamaica, the Leeward Islands, the four Windward Island colonies (Grenada, St. Vincent, St. Lucia and Dominica), Trinidad and Tobago, and Barbados, and the mainland colonies of British Guiana and British Honduras. Total area: about 100,000 sq.m. Population (1953): about 3,393,000. Pending the establishment of a British West Indies federation the following regional bodies existed in 1955: (i) Development and Welfare organization of the West Indies; headquarters, St. Michael, Barbados; comptroller, the United Kingdom co-chairman of the International Caribbean commission, *ex officio* (in 1955 Sir Stephen Luke); (ii) Regional Economic committee; permanent deputy chairman, the economic adviser to the Development and Welfare organization comptroller *ex officio* (in 1955 C. G. Beasley); (iii) British Caribbean Air Transport advisory council. (See also articles on the individual colonies.)

History.—Travelling mostly in the royal yacht "Britannia" Princess Margaret visited Trinidad and Tobago, Grenada, St. Vincent, Barbados, Antigua, St. Kitts, Jamaica and the Bahamas in the spring of 1955.

Agreement reached at a conference held in Trinidad in March to discuss freedom of movement between the colonies cleared the way for the last stages in the creation of a British West Indian federation. Provision was made for eventual participation by British Guiana and British Honduras.

A new Eastern Caribbean coinage was issued in November. A total of £13,560,000 (including £770,000 for regional projects) was allocated to the British West Indies, including British Guiana and British Honduras, under the Colonial Development and Welfare act of 1955. An education conference was held in March and a conference on training in industry in April, both at the University College of the West Indies at St. Andrew, Jamaica.

The purchase price of sugar under the Commonwealth Sugar agreement was £40 15s. a ton, or 5s. a ton less than in 1954. Following publication of the report of the citrus mission that visited the West Indies from the United Kingdom in 1954, the British Caribbean Citrus association was formed. A delegation to Washington obtained preliminary agreement to plans affording citrus producers some protection against U.S. competition.

A severe hurricane struck Barbados, Grenada and northern British Honduras in September.

West Indians, especially Jamaicans, continued their recent intensified migration to the United Kingdom at a rate of considerably more than 10,000 a year. (R. H. Y.)

ownell, Herbert, Jr. (1904–), U.S. government official, was born on Feb. 20 at ru, Neb. He received his bachelor's degree at the University Nebraska, Lincoln, in 1924 and his law degree at Yale university in 1927. He practised law in New York city and in 1932 s elected as a Republican to the New York state assembly, ere he served two terms. In 1942 he was campaign manager y Thomas E. Dewey in the latter's successful bid for the vernorship of New York. Brownell also managed Dewey's mpaigns for the Republican presidential nomination in 1944 d 1948 and was chairman of the Republican national com- tee from 1944 to 1946. He was an early supporter of Dwight Eisenhower and chief strategist in the latter's campaign for e presidential election in 1952. Eisenhower on Nov. 21, 1952, med Brownell attorney general in his cabinet, and he took ce on Jan. 21, 1953.

Brownell announced on April 28, 1955, that the department justice was preparing antitrust proceedings against the Amer- n Association of Advertising Agencies, the American News- per Publishers association and four other groups for alleged empts to control U.S. newspaper and magazine advertising; e suit was filed on May 12 in New York city.

ucker, Wilber Marion (1894–), U.S. secretary of the army, was born on June at Saginaw, Mich., and received his law degree from the iversity of Michigan, Ann Arbor, in 1916. He served with U.S. national guard in the Mexican expedition of 1916 and s an infantry officer with the American expeditionary forces World War I, receiving the silver star. After World War I he was admitted to the Michigan state bar (1919) and practised in his native city of Saginaw. From 1923 1927 he was prosecuting attorney for Saginaw county and m 1927 to 1928 assistant attorney general of Michigan; in 28 he became attorney general of the state, serving until 30. A Republican, he was elected governor of Michigan in 30 for the term 1931–33 but was defeated for re-election 1932.

On April 6, 1954, Brucker was nominated general counsel of federal department of defense, and his appointment was rmed April 19. When Robert T. Stevens resigned as secre- y of the army, Pres. Dwight D. Eisenhower on June 22, 1955, nominated Brucker to succeed him in that office.

udget, National. United States.—In a report dated Aug. 25, 1955, the bureau of the budget iewed the budget of the United States for the fiscal year end- June 30, 1956. The report presented revisions of the original al 1956 estimates contained in the Jan. 1955 budget docu- nt, together with actual expenditures and receipts data (in- ad of estimates) for the fiscal year 1955. The revised budget imates for 1956 were based on the revenue and appropriation s enacted by the congress in the session which adjourned g. 2, 1955.

Budget expenditures for fiscal year 1956 were estimated at \$18,800,000,000, as compared with \$64,500,000,000 in the previ- y year. Budget receipts were estimated at \$62,100,000,000 for

fiscal 1956—an increase of \$1,800,000,000 over 1955 “as a re- sult of the higher levels of income and profits.”

The budget deficit for fiscal year 1956 was placed at \$1,700,- 000,000. This was the lowest deficit in five fiscal years and compared with \$9,400,000,000 in 1953, \$3,100,000,000 in 1954 and \$4,200,000,000 in 1955. “Barring basic change in the inter- national situation,” the budget review noted, “the anticipated combination of reduced government expenditures and of rising revenues resulting from widely shared increasing prosperity should bring a balanced budget into sight within the year.”

The budget deficit of \$1,700,000,000 for fiscal 1956 was \$700,- 000,000 less than the estimate for 1956 which had been pre- sented in the January budget document. The reduction from the January forecast was attributed to the net effect of upward re- visions of \$2,100,000,000 in receipts (primarily because of “in- creasing levels of personal income and corporate profits”) and \$1,400,000,000 in expenditures (mostly for farm price supports, an unusually difficult item to estimate).

The budget report classified expenditures in three broad cate- gories. Outlays for the four major national security programs— military functions of the department of defense, foreign mili- tary assistance, Atomic Energy commission and stockpiling of strategic and military materials—accounted for \$38,700,000,000, or 61% of estimated total budget expenditures in 1956. Ex- penditures for these programs had risen from \$13,000,000,000, or 32% of the total budget, in fiscal year 1950, the last full year before the outbreak of aggression in Korea, to a peak of \$50,- 300,000,000, or 68% of the total, in 1953. Outlays in 1955 were \$40,400,000,000.

Expenditures for major programs termed “relatively uncon- trollable through the budget process” were estimated for fiscal

Table I.—Summary of Budget Receipts and Expenditures, United States
Fiscal Years 1954, 1955 and 1956

Description	1954 actual	1955 actual	1956 estimate
Budget receipts:

Reserve for contingencies . .	—	—	100,000,000
Total budget expenditures .	\$67,772,000,000	\$64,494,000,000	\$63,832,000,000
Budget deficit	\$3,117,000,000	\$4,192,000,000	\$1,732,000,000

1956 at \$16,600,000,000, or 26% of the total—up from 20% in 1953. These expenditures were \$200,000,000 more than the amount spent for such programs in fiscal year 1955. Increases totalling \$1,300,000,000 were anticipated for veterans' benefits; interest on the public debt; grants to the states for public assist- ance, unemployment compensation administration and high- ways; the government's contribution to the civil service retire- ment fund; and a few other items. But net expenditures re-

quired for farm price supports were estimated to decline by \$1,100,000,000 from their abnormally high 1955 level.

The remainder of the 1956 budget amounted to \$8,500,000,000, or 13%. The 1956 total for this category was estimated at \$800,000,000 more than in 1955 but \$600,000,000 less than in 1953. The 1955-56 increase reflected mainly the fact that net expenditures in 1955 had been reduced by the sale of government-owned synthetic rubber plants. The increase also stemmed from an expected rise in net expenditures for public housing programs, a larger postal deficit, and the pay raise for federal employees enacted in June 1955.

Major National Security.—Of the \$38,750,000,000 total of national security expenditures estimated for fiscal year 1956, \$34,000,000,000, or 88%, was allocated for military functions of the department of defense. This was \$1,500,000,000 less than in 1955 and \$6,300,000,000 less than in 1954. It was reported in the budget review that, despite these substantial reductions in dollar outlays, the nation's military forces would be stronger and more effective in 1956 than ever before in peacetime history. This was attributed to improved planning, better balance of forces and introduction of new weapons and techniques.

Expenditures for military functions of the Mutual Security program were scheduled at \$2,150,000,000 for fiscal 1956, or \$62,000,000 less than in the year before. Inclusive of the backlog of equipment items paid for in prior years, however, deliveries to friendly nations under the program were expected to be about the same as in 1955.

Atomic Energy commission outlays for 1956 were placed at \$1,900,000,000 in the budget report. These would be the highest in history, and \$44,000,000 above 1955.

Expenditures for the stockpiling of strategic materials in 1956 were estimated at \$700,000,000, or about \$100,000,000 less than was spent in 1955. The reduction was attributed mainly to diversions from stockpile contracts to satisfy increased private demand for materials. It did not reflect any change in procurement toward long-term objectives.

International Affairs and Finance.—Budget expenditures for international programs of the government in fiscal 1956 were estimated at \$2,121,000,000, down \$63,000,000 from 1955. The largest decrease in this category was for the economic and technical portion of the Mutual Security program, for which scheduled outlays would be reduced to \$1,750,000,000 as compared with \$1,902,000,000 in fiscal 1955. Assistance to western Europe would show a continued reduction while 1956 expenditures for the less developed areas of the world were estimated at about their 1955 levels.

Veterans' Services and Benefits.—The revised budget for fiscal year 1956 placed expenditures for veterans' programs at \$4,839,000,000. The increase of \$383,000,000 over 1955 was earmarked chiefly for disability compensation and pensions, readjustment benefits (covering principally education and training and unemployment compensation) and hospital and medical programs. More veterans were expected to become eligible for these various types of benefits. In addition, increased benefit rates for disability compensation and pensions were effective during only part of fiscal year 1955.

Welfare, Health and Education.—Expenditures for programs covering welfare, health and education were estimated at \$2,425,000,000 for 1956, or \$152,000,000 more than in 1955. Increases occurred chiefly in three types of programs—health, including medical research and the new program for polio prevention; public assistance grants to the states, which were estimated at \$1,464,000,000 for 1956; and grants for the construction of hospitals and other health facilities.

Agriculture and Agricultural Resources.—Expenditures for operating agricultural programs of the government, after rising

"IT AIN'T EASY—" a 1955 cartoon by Manning of the McNaught Syndicate

from \$2,600,000,000 in 1954 to \$4,400,000,000 in 1955, were estimated at \$3,380,000,000 for fiscal year 1956. These movements were dominated by price support outlays. At \$3,300,000,000, such outlays were at a record high in 1955 but were estimated to drop to \$2,200,000,000 in 1956. This expected reduction in net budgetary expenditures was attributed mainly to somewhat lower volume of price support loans and purchases and to an increase in receipts of the Commodity Credit Corporation from sales of commodities out of inventory.

Expenditures for agricultural programs other than price supports were estimated to rise by \$121,000,000. The largest increase was for removing surplus perishable commodities from the market and distributing them to schools and charitable institutions.

Natural Resources.—The government's programs to conserve and develop natural resources were estimated to require expenditures of \$1,023,000,000 in fiscal year 1956 as compared with \$1,075,000,000 in the previous year. Net expenditures of the Tennessee Valley authority were expected to drop from \$17,000,000 to \$42,000,000 because of declining outlays for construction and an increase in operating receipts from the sale of power. However, moderate increases were scheduled for flood control, reclamation and multiple-purpose power projects of the corps of engineers and the bureau of reclamation, as well as for most other natural resources programs.

Commerce and Manpower.—Net expenditures for administering the government's commerce and manpower programs in 1956 were placed at \$2,760,000,000—\$665,000,000 more than actual outlays in 1955. Net expenditures in 1955 had been lowered about \$400,000,000 because of the sale of synthetic rubber plants and inventories. In addition, it was anticipated that outlays for public housing would increase appreciably (because such outlays had been reduced in 1955 by receipts from private refinancing of earlier loans), that federal-aid expenditures for highways would advance to a record high, that the postal deficit would show a further rise and that increases would occur in a number of other items comprising the varied commerce

power category. On the other hand, net budget expenditures of the Federal National Mortgage association were expected to show a decline of \$459,000,000. This stemmed from estimated receipts of \$220,000,000 in 1956 as against net expenditures of \$239,000,000 in 1955.

General Government.—Expenditures for general government services and activities in fiscal 1956 were included in the budget at \$1,667,000,000, about \$500,000,000 more than in 1955. The increase was accounted for in large measure by the resumption in 1956, after a two-year suspension, of the government's payment to the Civil Service Retirement and Disability fund.

Interest.—Interest payments by the federal government were expected to rise by \$308,000,000 to a total of \$6,765,000,000 in fiscal year 1956. This increase reflected both a growth in the public debt and somewhat higher interest rates.

Great Britain.—The 1955-56 budget of Great Britain presented to the house of commons by Chancellor of the Exchequer A. Butler in April 1955 showed total receipts of £4,710,000,000, about the same as in the preceding fiscal year. (See Table II.) The budget allowed for reduction in taxation (£134,250,000), chiefly through lower individual income tax rates and higher personal allowances, or exemptions.

Total budget expenditures were expected to increase from £4,050,000,000 in fiscal 1954-55 to £4,562,000,000 in the fiscal 1955-56 period. Although Great Britain's defense costs—accounting for about one-third of total ordinary expenditures—were scheduled to advance by almost £60,000,000, the bulk of the anticipated increase in governmental outlays was civilian in character.

Despite the increase in expenditures relative to stable receipts, the 1955-56 budget provided for a surplus of £148,000,000. This was considerably smaller than the £433,000,000 surplus of ordinary receipts over ordinary expenditures in the preceding year.

In late Oct. 1955 Butler introduced a supplementary budget designed to counteract inflation. It called for both increases in taxes and reductions in governmental expenditures.

The budget proposals included a 20% rise in the purchase tax on consumer goods, as well as an increase from 22½% to 27½% in the tax on distributed business profits. Together, these measures were estimated to yield about £110,000,000 on a full year's basis. Increases in postal rates and in charges for telegraph and telephone services were expected to yield an additional £25,000,000 a year.

On the expenditure side of the budget, savings would result from a reduction in housing subsidies and from prospective economies in other public sectors, including the nationalized industries. The amounts by which government spending (as shown in Table II) would be reduced were not specified, but Butler

indicated that they would be substantial. (See also DEBT, NATIONAL; INCOME AND PRODUCT, U.S.; TAXATION; UNITED STATES.) (C. F. Sz.)

Buhl Foundation: see SOCIETIES AND ASSOCIATIONS, U.S.

Building and Construction Industry. During 1955 the building and construction industry continued to play its dominant role in the economy of the United States. New high points in construction activity were reached each month during the year and by September the aggregate value of work put in place amounted to \$31,000,000,000, 12% above the total for the nine-month period of the previous year. On the basis of the experience during the first three quarters of the year, government experts estimated that 1955 would break all previous records with the volume of construction approximating \$42,000,000,000, an amount 11% above the previous high point set in 1954 (see Table I).

Expenditures for residential construction (excluding farms) comprised almost two-fifths of the total. New dwelling units were started at the rate of 1,300,000 a year, a level second only to that reached in 1950. The dollar volume of residential building in the first nine months of 1955 was 24% higher than the volume of the January to September period of previous year, the rise being mainly attributable to the construction of more and larger houses.

The most unexpected development of the year was the reversal of the two-year downward trend in private industrial building. From a trough in the summer of 1954, new investment in industrial plants moved sharply upward during the last half of the year, held level for the first five months of 1955 and then jumped from an outlay of \$183,000,000 in May to \$210,000,000 four months later. Industrial expenditures, Jan.-Sept. 1955, were 15% higher than the total for the same period of the previous year, and the September total was 30% higher than the comparable month of 1954.

The construction of designed shopping centres in the more recently developed suburban areas proceeded at an accelerated rate. The centres were of all types—ranging from small groups of stores clustered around a food supermarket to huge developments containing a large department store and a score of smaller retail and service establishments. During the first nine months of 1955, the total outlay for the construction of new stores, restaurants and garages amounted to the staggering total of \$1,370,000,000, 48% above the amount for the same period of 1954.

Despite the boom some sections of the construction economy lost ground during 1955. Outlays for farm and railroad construction were each down 10% from the previous year. Expenditures

RESCUE WORKERS searching the debris for bodies after a section of a new sports amphitheatre under construction in New York city collapsed May 9, 1955. The concrete floor fell 22 ft. to the ground level

for public housing and for public industrial facilities dropped sharply, in part compensated by increases for military purposes and for schools. But in spite of the rise in educational construction, the U.S. office of education estimated that the nation faced a deficit of 250,000 schoolrooms at the opening of the fall semester, and unless the rate of school construction changed drastically, it appeared that the shortage would not be reduced much below 176,000 rooms by 1960. In all, however, despite some serious problems, the construction industry was in an exuberant state in 1955 and the outlook for 1956 pointed to the establishment of new records.

Construction Costs.—The protracted building boom had a classic influence on the supply of building materials and on construction costs. During the 12-month period ending July 1955, the department of commerce composite index moved consistently upward from 122 to 126 (1947-49=100), a gain of 3%. The major portion of the rise came in the late spring and early summer months when the unusually high building volume was augmented by the characteristic seasonal upturn. There was little variation in the

change in costs among the different types of construction, with commercial and factory buildings up slightly more and residences, hotels and office building up slightly less than the average increase.

Wholesale prices of building material, which had fluctuated within a very narrow range from 1951, began to move steadily upward in mid-1954. By the summer of 1955 the bureau of labor statistics price index had risen from 120.5 to 125.7 (1947-49=100), an all-time high. Commodities mainly responsible for the advance were lumber, up 6%; structural shapes, up 8%; clay products, up 8%; metal sash and asphalt roofing, each up 13%.

It was a banner year for the output of most major building materials. New postwar records were registered in the manufacture of lumber, wood, asphalt, iron, steel, portland cement and clay construction products. But despite the high levels of production, the unusual demands levied by the construction industry caused material shortages to appear in some areas of the nation, particularly in such commodities as portland cement and certain metal items. Unfilled orders for structural steel which mounted steadily from the first of the year, totalled 1,706,000 tons by July 1, 1955. In the first half of the year new orders were one-third above orders in the same period of the previous year. More critical than steel was the copper supply which received two weakening blows in the course of the year—a protracted strike which cost 5% of the annual copper consumption and hurricane floods which destroyed or delayed production in one-third of the nation's brass mills in the late summer and early fall. By the end of the year, materials supply conditions were more or less normal, but experts were predicting that the pressure on supply would cause prices to rise further during the remainder of the year and in early 1956.

Employment and Earnings.—Building and construction continued to provide an important source of employment, with more than 2,600,000 workers engaged in the industry at mid-year. Special trade contractors (plumbing, heating, electrical work, etc.) accounted for approximately half of the workers and general contractors one-third. The remainder were employed on streets, highways and other nonbuilding projects.

Table 1.—New Construction Activity, Continental United States*

Type of construction	1955		1954	First 9 months		Percent change

*Joint estimates of the Department of Commerce and the Department of Labor.
†Change of less than 0.5%.

The work week in 1955 was virtually the same as in the previous year, ranging from 35 hours in the slow winter months to 40 hours at the seasonal peak. In the late months of 1954 average hourly earnings rose from \$2.51 to \$2.59 and remained at approximately that level during the first half of 1955. This increase brought the building workers' wages to the highest point in record, exceeding \$97 per week in June 1955.

Increase in the wage scale for the organized sections of the industry served to boost the general levels. Union minimum rates rose in most cities and average hourly rates increased for all crafts (see Table II). Carpenters received the greatest rise, 12 cents per hour, while rates in other crafts went up 7 to 10 cents per hour. Proportionally, the increases ranged from 2% for bricklayers and plumbers to 5% for building labourers. At midyear organized building and construction workers were among the highest paid workers in the United States. Bricklayers were receiving \$3.47 per hour on the average, and semi-skilled labour was earning in excess of \$2.00 per hour.

Urban Renewal.—The urban renewal program passed an important milestone in 1955. The \$500,000,000 of capital grants authorized by the Housing act of 1949 was completely committed, and further commitments were made from the second \$500,000,000 approved by congress. The initial authorization was reserved for 316 projects in more than 200 communities. Grant contracts totalling \$180,000,000, covering 100 projects in 67 areas, had been authorized by the fall of 1955. Under the law the federal government might defray as much as two-thirds of project costs through direct capital subsidy.

One of the measures for preventing the further growth of slums and slums was the establishment of a federal program of attaching grants to states and metropolitan areas to enable smaller communities to do the planning necessary to arrest the spread of deterioration. The purpose of the program was to stimulate guidance and control of urban development in the fringe areas around major cities and in smaller communities where effective planning was otherwise not likely to be undertaken. Among the projects that had been financed were a regional study by the Rhode Island Development council to determine ways of reducing storm and hurricane damage to urban communities, preparation or revision of the general plans for the Atlanta, Ga., Little Rock, Ark., and Detroit, Mich., metropolitan areas and special planning studies in a number of small municipalities in the southern states. In the past there had been a tendency for the bulk of federal redevelopment aid to flow to the larger urban centres—one-third of the capital grants had gone to cities of more than 1,000,000 and three-fifths to cities of more than 500,000 population.

Other types of federal grants were made available for demonstration projects that would be useful in guiding citizens and local officials in other cities. The first of these "section 314" awards went to St. Louis, Mo., to help the city develop acceptable standards for measuring the adequacy of commercial and industrial structures comparable to those promulgated in the field of housing by the American Public Health association. In New Orleans, La., a demonstration project was to study all phases of the city's housing program ranging from the effects of code enforcement to the social and economic results of housing

and neighbourhood improvement. (See also ARCHITECTURE; BUSINESS REVIEW; HOUSING; TOWN AND REGIONAL PLANNING.) (CH. RA.)

Bulganin, Nikolai Alexandrovich (1895–). Soviet politician.

was born at Nijni-Novgorod (now Gorky), June 11. He joined the Communist party in 1917 and from 1922 held executive posts in the Higher Council of National Economy. In 1927 he was appointed director of the Moscow power station. From Jan. 1931 he was secretary of the Moscow city committee or "mayor" of the Soviet capital. In 1937 he became chairman of the council of people's commissars of the R.S.F.S.R. and during 1938–41 he was also deputy chairman of the council of people's commissars of the U.S.S.R. and head of the state bank. In 1934 the 17th congress of the All-Union Communist party elected him a member of the central committee, but he was appointed a substitute member of the Politburo only in 1946 and a full member in Feb. 1948. He first donned military uniform in Oct. 1941 as political commissar to G. K. Zhukov's army group, whose task was to defend Moscow. In 1944 his mission was to organize the so-called Polish Committee of National Liberation which he brought to Lublin as the Polish provisional government. On Dec. 22, 1944, now a full general, he succeeded Marshal K. E. Voroshilov as deputy commissar of the Soviet armed forces. He was appointed a deputy chairman of the Soviet council of ministers on March 19, 1946, and on March 3, 1947, as a marshal of the Soviet Union, he succeeded J. V. Stalin as minister of the armed forces. On March 24, 1949, he was relieved of the latter duties, becoming the chief inspector of the Soviet satellite armies. On March 6, 1953, after Stalin's death, he was appointed one of the four deputy chairmen of the council of ministers and minister of the armed forces. When G. M. Malenkov resigned as chairman of the Soviet council of ministers on Feb. 8, 1955, Bulganin succeeded him. In this capacity he presided over the signature of the treaty of mutual assistance between the U.S.S.R. and seven European satellites (Warsaw, May 14); from May 26 to June 2, together with N. S. Khrushchev and four other Soviet delegates, he paid a good-will visit to Yugoslavia; on July 18 he was in Geneva taking part in the conference of the heads of the Big Four Powers; in November and December, with Khrushchev, he made a good-will tour of India, Burma and Afghanistan.

Bulgaria. A people's republic in the eastern part of the Balkan peninsula, Bulgaria is bounded north by Rumania, west by Yugoslavia, south by Greece and east by Turkey and the Black sea. Area 42,796 sq.mi. Pop.: (1946 census) 7,022,206; (1953 est.) 7,500,000. Language (1947 est.): Bulgarian 88%; Turkish 9.8%. Religion (1947 est.): Greek Orthodox 84%; Moslem 11.5% (of which one-sixth Pomaks, or Moslem Bulgars, remainder Turks); Roman Catholic 0.9%; Gregorian Armenian 0.4%; Jewish 0.3%; Protestant 0.2%. Chief towns (pop., 1946 census): Sofia (cap.) 434,888 (1953 est., 600,000); Plovdiv 125,440 (1953 est., 150,000); Stalin, formerly Varna 77,792; Russe 53,420; Burgas 43,684. First secretary of the Bulgarian Communist party in 1955, Todor Zhivkov; chairman of the presidium of the national assembly, Gen. Georgi Damianov; chairman of the council of ministers, Vlko Chervenkov.

History.—There were no major political upheavals in Bulgaria during 1955. The communist rulers gave every indication of wishing to consolidate their regime quietly and win for it a measure of popular support. This desire was manifested notably in the resuscitation of the Fatherland front, the rehabilitation of Agrarian party leaders, the diminution of police terror and a

Table II.—Average Union Wage Scales for Selected Trades, July 1955

Trade	Low	Rate level		Increase	
		Average	High	July 1954–July 1955	Per cent

Source: Bureau of Labor Statistics.

certain improvement in the economic conditions of the peasants and the people as a whole. The country's greatest single problem remained the low level of agricultural production.

One of the main causes of inefficiency was declared to be the excessively bureaucratic and centralized administration of agriculture. An effort to remedy this was made in May when the government decreed that both collective and independent farmers would henceforth be responsible for determining the size and nature of crops to be sown, while the central authorities would decide only the general targets. Despite this deference to local initiative there was no tendency to slacken the pressure for further collectivization of farming.

Notwithstanding the admitted shortages of foodstuffs and consumer goods, price reductions ranging from 10% to 15% on a wide range of goods were announced in April.

In foreign affairs the Bulgarian government continued to follow unquestioningly the lead of the Soviet government. In May it was represented at the conference of communist countries in Warsaw and entered into new political and military agreements with the Soviet Union and the other nations of the Soviet bloc. This involved placing a section of the Bulgarian armed forces at the disposal of a joint military command with headquarters in Moscow. In September it was announced that the total number of men under arms would be reduced by 18,000.

In June the Soviet leaders N. A. Bulganin and N. S. Khrushchev visited Sofia, apparently to explain the reasons for their change of policy toward Marshal Tito. Relations, both political and economic, with Yugoslavia were noticeably improved in the latter half of the year. (See also EASTERN EUROPEAN ECONOMIC PLANNING.) (D. Fd.)

Education.—Schools (1953): nursery 5,919, pupils 264,892; (1950) primary 6,112, pupils 755,628, teachers 18,801; higher primary 2,960, pupils 308,160, teachers 12,636; secondary 218, pupils 112,633, teachers 4,624; (1952) vocational, pupils 67,679; institutions of higher education 20, students 31,512, teaching staff about 2,000.

Agriculture.—No reliable data published since 1949. Main crops (metric tons, 1948-50): wheat 1,503,000; maize 890,000; barley 249,000; rye 170,000; oats 97,000; potatoes (1934-38 average) 109,000; tobacco 20,000; sugar, raw 58,000. Wine production (1949) 426,000 hl. Live-stock (1953 est.): sheep and goats 8,400,000; cattle 1,700,000; pigs 2,074,000; horses 460,000. Wool production, greasy basis (1951) 12,700 tons.

Industry.—Employment outside agriculture, manual (1953): 550,000. Production (metric tons, 1954 est.): coal 380,000; lignite 8,400,000; electricity 1,800,000,000 kw.hr.; cement (1952) 674,000; nitrogen fertilizers 70,000; sulphuric acid (1952) 20,800; woollen fabrics (1952) 8,700,000 m.; cotton fabrics (1952) 110,000,000 m.

Finance.—Monetary unit: lev (pl. leva) with an official exchange rate, high and fictitious, of 6.80 leva to the U.S. dollar. Budget (1954 est.): revenue 18,200,000,000 leva; expenditure 17,000,000,000 leva, including 9,500,000,000 leva invested in the national economy.

Foreign Trade.—(1950) Imports U.S. \$178,000,000; exports U.S. \$133,000,000. Main sources of imports (1950): U.S.S.R. 67.4%; Czechoslovakia, Hungary, Poland and Rumania 24.1%. Main destinations of exports: U.S.S.R. 45.1%; four other eastern European countries 30.8%. In 1953, 57% of Bulgarian foreign trade was with the U.S.S.R. and 30% with the other countries of the Soviet bloc. Bulgarian trade with 17 western European countries (1953): exports 24.9%; imports 23.4%.

Transport and Communications.—Roads (1952): 13,870 mi. Licensed motor vehicles (Dec. 1950): cars 6,000, commercial 5,000. Railways (1952): 2,231 mi. Telephones (1954 est.): 61,000; radio receiving sets (1952) about 300,000, including 78,000 community loudspeakers.

Burke, Arleigh Albert (1901-), U.S. naval officer, was born Oct. 19 at Boulder, Colo., and was graduated from the U.S. naval academy at Annapolis, Md., in 1923, later taking an M.S. degree from the University of Michigan, Ann Arbor. As an ensign he served aboard the U.S. battleship "Arizona." Placed in command of a destroyer division and later a destroyer squadron in 1943, he earned the nickname of "31-Knot Burke" because of his swift and hard-hitting destroyer attacks on the Japanese fleet and merchant marine in the Pacific during World War II. After the war he was leader of the so-called "admirals' revolt" against unification of the U.S. armed forces; at the same time he op-

posed the air force's advocacy of B-36 long-range atomic bombers as the key to U.S. strategic offense and proposed instead the construction of a fleet of supercarriers by the navy. Burke was advanced to the rank of rear admiral in June 1950, serving thereafter in the Korean war. At the time of his appointment on May 25, 1955, by Pres. Dwight D. Eisenhower as chief of naval operations, Burke was commander of the U.S. navy's Atlantic destroyer staff and 93rd on the list of ranking naval line officers. His appointment to succeed Adm. Robert B. Carney was effective Aug. 16, 1955, with the rank of full admiral.

Burma. An independent federal republic on the eastern side of the Bay of Bengal, Burma lies between Pakistan and India on the northwest, Tibet on the north and China, Laos and Thailand (Siam) on the east. The republic comprises Burm proper, the Karen, Shan, Kachin and Kayah states, and the Chin special division. Area: 261,757 sq.mi. Pop.: (1941 census 16,823,798; (1954 est.) 19,242,000. Racially, the peoples of Burma are Mongoloid. Religion: Buddhist (90%). Language: Burmese (66%). Largest indigenous minorities: Karens, Shans, Kachins, Chins, etc. Largest immigrant minorities (1955 est.): Indian 600,000, divided equally between Moslems and Hindus. Chinese 350,000. Chief towns (pop., 1953 preliminary census): Rangoon (cap.) 711,520; Mandalay 182,367; Moulmein 101,720; Bassein 77,382; Henzada 60,666; Pegu 45,941; Akyab 41,589. President of the republic in 1955, Ba U; prime minister, N. U. U. Nu.

History.—Various rebellions and much ordinary dacoity continued during 1955. Papun, the last Karen rebel stronghold in the Thaton area, fell to government troops in March and November a leading Arakan insurgent surrendered in response to an amnesty offer made in October in the hope of restoring order before the general election which was due to be held in April 1956. The remnant Chinese Nationalist forces along the eastern frontier were quiescent during the year and following discussions between Burmese and Thai officials at Chiengmai in February, the Thais undertook to give Burma facilities to assist in dealing with them. The army was offered arms and equipment for a brigade as a gift by Marshal Tito of Yugoslavia during his visit in January, and these arms began to arrive later in the year.

There were a number of government changes during the year. In May a new ministry of national solidarity was formed with a Kachin at its head. This and ministerial changes increased the cabinet to 23, of whom 3 were Karens, 2 Kachins and 2 Chins. The social developments on which the government laid great stress continued, but were somewhat inhibited by financial stringency and other difficulties. The minister of co-operative speaking at the first conference of the Union Co-operative council in Rangoon on Sept. 20, reported on the difficulties encountered during the first four years of the five-year plan for co-operatives. The minister of land nationalization, on the other hand, informed the chamber of deputies in September that since 1953, 586,290 ac. of land had been distributed under the Land Nationalization act in 690 villages in 29 districts with satisfactory results.

There was continued difficulty in selling rice despite heavy falls in price. Foreign exchange reserves fell alarmingly despite measures taken on March 7 to restrict imports. The decline in reserves was checked in August and on Sept. 20 it was announced that India would make Burma a loan of 200,000,000 rupees which it was hoped would tide the country over its immediate difficulties. Efforts were made by the government to expand production of agricultural produce such as peanuts, and to restore basic Burmese export industries such as teak. It was announced in October that a British firm had been engaged to open up the Kalewa coal field which it was hoped would yield

PRIME MINISTER NU of Burma inspecting a British royal air force honour guard in London June 16, 1955. His world tour also included visits to Yugoslavia and the U.S.

10,000 tons of coal a year and a survey was begun to see if this could be brought down the Irrawaddy by boat. The budget, which was presented on Sept. 1, provided for a cut of more than one-fourth in expenditure on capital items. To offset the shortage of capital for development the government sought a loan from the International Bank for Reconstruction and Development and on June 10 issued a policy statement welcoming foreign investment in all fields except major public utilities and the manufacture of munitions, and offering safeguards against nationalization.

The government went to great lengths to emphasize its new position in international affairs. The prime minister visited a large number of countries, including China, the Soviet Union, Poland, the United States, Yugoslavia and Israel, and attended an Asian-African conference at Bandung, Indon. Diplomatic relations were established with the German Federal Republic and Czechoslovakia and there was an exchange of consulates general in Kunming and Lashio, with China. Trade agreements, mostly designed to dispose of Burma's rice surplus, were made with countries of every political complexion and on Nov. 8 an agreement was signed to permit the operation of a Burmese air line to Kunming and Canton and a Chinese line to Mandalay and Rangoon. (A. S. B. O.)

Education.—Schools (1954): state primary 6,907, pupils 755,900, teachers (1952) 10,815; secondary and middle about 477 (416 in 1952), pupils 101,300, teachers (1952) 4,612; pupils in private schools 82,200. Teachers in training (1954) 1,027. University of Rangoon and university college of Mandalay (1955): students 9,000.

Finance and Banking.—Monetary unit: kyat, with an exchange rate of 13 to the pound sterling and 4.76 to the U.S. dollar. Budget (1955): revenue 1,079,600,000 kyats; expenditure 1,348,500,000 kyats. Currency circulation (1954) 574,800,000 kyats. Deposit money 417,300,000 kyats. Gold and foreign exchange holdings (1954): U.S. \$142,400,000.

Foreign Trade.—(1954) Imports 946,200,000 kyats; exports 1,061,700,000 kyats. Main sources of imports (1953): India 27%; U.K. 26%; Japan and other sterling area 11%; continental European Payments Union countries 12%; Japan 17%; U.S. and Canada 4%. Main destinations of exports (1953): India 17%; Japan 14%; Ceylon 13%; Indonesia 12%; U.K. 9%; other sterling area 23%. Chief exports (1954): rice 2%; teak 2%; cotton 2%.

Transport and Communications.—Roads (1949): 19,955 km. Motor vehicles in use (1953): cars 12,400; commercial vehicles 9,800. Railways (1954) 2,875 km.; passenger-km. (1953) 605,000,000; freight, ton-km. (1954) 524,900,000. Telephones (Jan. 1954): 7,136. Radio sets (1952): 100,000.

Agriculture.—Main crops (metric tons, 1954): rice 5,908,000; sesame 100,000; peanuts 163,000; cottonseed 35,000; cotton, lint 18,000; sugar, value (1953) 23,000; dry beans (1953) 115,000. Livestock (June 1953, excluding Putao, Chin hills, Shan states and Karenni), cattle 13,000, sheep 30,000, pigs 467,000, buffaloes (Sept. 1953) 793,000, goats (1950) 172,000.

Industry.—Raw materials (metric tons, 1954): natural rubber (net exports) 10,100; tin concentrates, metal content 960; crude oil 176,200; zinc 9,700; tungsten 712; silver 18; salt 63,400.

Buses: see MOTOR TRANSPORTATION; URBAN TRANSPORTATION, U.S.

Business Review. The economy of the United States in 1955 was characterized by high-level activity, marked and sustained recovery from the levelling off in activity which occurred during the last two quarters of 1953 and the first three quarters of 1954, and the establishment of new high peaks in many sectors of the economy. In general, by the end of the third quarter of 1954, the economy had adjusted to the underlying changes in the structure of demand incident to the end, in mid-1953, of the post-Korean rise in defense spending, and by the end of the fourth quarter much of the ground lost during the five quarters of recession had been recovered.

During the first three quarters of 1955, in spite of the continued drop in federal government expenditures, there was rapid expansion in the economy along a broad front sparked by a diversified rise in civilian purchases which provided the expansionary force to accelerate the upward trend.

The upturn in business activity in the fourth quarter of 1954 stemmed, in part, from the continued strength in certain sectors of the economy—construction, finance, utilities and service—not much affected by the demand shift, and was accelerated as other industries which had held stable or dipped only moderately resumed their postwar expansion, and as the durable-goods industries along with the related mining and transportation industries, hardest hit by the demand shift, began to feel the stimulus of the accelerated expansion in the automobile industry and increased consumer demand for other durable commodities. By the end of the first quarter of 1955, nondurable-goods production had recovered all the ground lost during the recession, and it reached a new high peak in the second quarter. Durable-goods production expanded rapidly during the first two quarters of the year and by the end of the third quarter had advanced to a new high postwar peak.

Although employment declined from Sept. 1954 through Feb. 1955, labour income continued to rise, reflecting the increase in average hourly earnings and the lengthening of the work week in the manufacturing industries by approximately one hour. Both total personal income and disposable personal income after taxes, of which labour income is the main component, increased during the fourth quarter of 1954, and after a slight drop in Jan. 1955 expanded rapidly through July to establish a new high peak from which there was only a minor decline in August.

The upward trend in personal consumption expenditures was uninterrupted during the period of readjustment and was accelerated during the first three quarters of the year. The expansion in disposable personal income and the propensity of consumers to spend, combined with the rapid increase in gross private domestic investment, served to cushion the effects of demand readjustments in the sectors of the economy affected by the substantial drop in government expenditures for security. Consumer demand was further augmented by the rapid expansion in consumer credit, especially instalment credit which climbed to a new high peak of more than \$26,000,000,000 in August, about one-half of which was automobile finance paper.

Production of consumer goods tended to keep pace with expanding consumer demand with the result that retail prices remained substantially unchanged during the first three quarters of the year at levels only slightly below the peaks established following the rapid post-Korean war increase in 1950. Wholesale prices of commodities other than farm and food products during the first two quarters of the year were somewhat above the level of 1954, and a rapid rise during the third quarter carried them above the previous peak in the first quarter of 1951. Prices

of farm products at wholesale rose during the first four months of the year from the Dec. 1954 low, but after April the decline which had been in process since early 1951 was resumed and a new low was reached in Aug. 1955 from which there was only a slight upturn in September.

National Product.—The gross national product, the total output of goods and services, as estimated by the department of commerce, rose in the first quarter of 1955 to an annual rate of \$375,300,000,000, which was \$17,000,000,000 above the first quarter of 1954. During the second quarter of 1955 the annual rate was stepped up to \$384,800,000,000, and in the third quarter it was further increased to an annual rate of \$392,000,000,000, a new all-time high. The previous high annual rate had been \$370,000,000,000 in the second quarter of 1953.

The reversal in the fourth quarter of 1954 in the downward trend in the gross national product which had been in process since the second quarter in 1953 was primarily the result of an expansion in gross private domestic investment and an increase in personal consumption expenditures. Of the \$8,300,000,000 increase in the gross national product in the fourth quarter of 1954 from the third quarter, \$4,800,000,000 represented expansion in private domestic investment and \$3,100,000,000 expansion in personal consumption expenditures. The expansion in both private domestic investment and personal consumption expenditures continued throughout the first three quarters of 1955. In the third quarter there was some slackening in the rate of increase in private domestic investment but the rate of personal consumption expenditures continued to increase. Pri-

vate domestic investment in the third quarter of 1955 at an annual rate of \$60,700,000,000 represented an increase of \$14,800,000,000 from the third quarter of 1954, of \$6,600,000,000 from the first quarter of 1955 and of \$600,000,000 from the second quarter of 1955. Personal consumption expenditures estimated at an annual rate of \$256,500,000,000 in the third quarter of 1955 represented an increase of \$18,600,000,000 from the third quarter of 1954, of \$10,700,000,000 from the first quarter of 1955 and of \$6,000,000,000 from the second quarter of 1955.

The continued increase in the annual rate of gross private domestic investment from the fourth quarter of 1954 through the third quarter of 1955 was primarily the result of expansion in fixed investment although after the fourth quarter of 1954 there was an expansion in business inventories following the liquidation of inventories throughout the four quarters of 1954. Fixed investment in the third quarter of 1955 at an annual rate of \$57,700,000,000 was \$7,000,000,000 above the third quarter of 1954 and \$5,000,000,000 above the first quarter of 1955. The investment in business inventories at an annual rate of \$3,000,000,000 in the third quarter of 1955 was an increase of \$1,500,000,000 from the first quarter of the year although it was a drop of \$1,300,000,000 from the high second-quarter rate of \$4,300,000,000.

During the first quarter of 1955, the annual rate of government expenditures for goods and services was stepped up to \$1,300,000,000 to \$75,800,000,000, but dropped to \$74,900,000,000 during the second quarter and at an estimated \$75,500,000,000 during the third quarter.

00,000 for the third quarter as \$300,000,000 below the third quarter of 1954 and the first quarter of 1955.

National Income.—In the fourth quarter of 1954 the downward trend in the national income, or purchasing power distributed through the economy, which had been in progress since the second quarter of 1953, was reversed. The annual rate of income flow continued to increase through the first two quarters of 1955. At a seasonally adjusted annual rate of \$20,700,000,000 in the second quarter of 1955, the total was \$300,000,000 above the first quarter, \$17,500,000,000 above the fourth quarter of 1954 and \$1,800,000,000 above the corresponding quarter in 1954. The accelerating advance to mid-1955 wiped out the previous decline and carried the total to a new high, 4% above the previous peak recorded two years earlier in the second quarter of 1953. The income flow to employees continued to increase through the first three quarters of 1955. In the third quarter the Council of Economic Advisers estimated the annual rate at \$224,300,000,000, a new high \$12,900,000,000 above the third-quarter 1953 peak of \$211,400,000,000. The 1955 third-quarter total was at a rate \$11,200,000,000 above the first quarter of the year and \$4,800,000,000 above the second quarter.

Corporate profits before taxes and after inventory valuation adjustments increased steadily from the fourth quarter of 1954 through the second quarter of 1955, reflecting the expansion in production and the increased tempo of business activity. For the second quarter of 1955, the Council of Economic Advisers estimated the annual rate at \$42,200,000,000, a new high \$800,000,000 above the 1953 first-quarter peak.

Proprietors' income in business and the professions increased rapidly though moderately through the third quarter of 1955, when it was at an annual rate of \$27,500,000,000. Rental income for persons remained substantially unchanged after the fourth quarter of 1954 at \$10,700,000,000, practically the same rate that prevailed throughout 1953 and 1954.

Proprietors' income from farming including adjustments for inventory changes continued, through the third quarter of 1955, the decline which had been in process with only short-lived interruptions since the fourth quarter of 1951. Farm proprietors' income for the third quarter of 1955 was estimated by the Council of Economic Advisers at an annual rate of \$10,500,000,000, a drop of \$1,000,000,000 from the first quarter and of \$300,000,000 from the 1951 annual average of \$15,800,000,000. (See also INCOME AND PRODUCT, U.S.)

Personal Income, Spending and Savings.—Consumers' personal consumption expenditures continued to increase through the third quarter of 1955 and at a somewhat accelerated rate after the fourth quarter of 1954. The estimated rate for the third quarter of 1955 was \$256,500,000,000, an increase of \$2,700,000,000 from the first quarter, of \$15,500,000,000 from the fourth quarter and of \$18,600,000,000 from the third quarter of 1954. The Council of Economic Advisers estimated personal savings at an annual rate of \$15,500,000,000 in the third quarter of 1955, a drop of \$1,300,000,000 from the fourth

DISPLAY OF 1,001 GADGETS at the 23rd National Housewares show at Atlantic City, N.J., July 1955

quarter of 1954 and of \$5,500,000,000 from the first quarter of 1954. Personal savings during the first three quarters of 1955 averaged 5.7% of disposable personal income as compared with an average of 7.2% for the year 1954. Total personal income, which increased steadily throughout 1954, continued to increase through the first three quarters of 1955, reflecting primarily the increases in wages and salary income and in proprietors' income in business and the professions. The Council of Economic Advisers estimated the personal income flow in the third quarter of 1955 at an annual rate of \$306,000,000,000, an increase of \$15,200,000,000 from the fourth quarter of 1954, of \$13,400,000,000 from the first quarter of 1955 and of \$5,500,000,000 from the second quarter. Personal taxes in the third quarter of 1955 were estimated at \$34,000,000,000, an increase of \$1,400,000,000 from the first quarter and of \$600,000,000 from the second quarter.

Government Expenditures.—Federal, state and local government purchases of goods and services, for the first three quarters of 1955, as reported by the department of commerce, were at substantially the same level as in the last three quarters of 1954, at an average annual rate of \$75,400,000,000. Federal government expenditures for national security during the first three quarters of 1955 remained substantially unchanged from the 1954 fourth-quarter rate of \$40,500,000,000. The continued increase in state and local government expenditures throughout 1954 and the first three quarters of 1955 tended to offset somewhat the drop in federal government expenditures. State and local government expenditures at an annual rate of \$30,100,000,000 in the third quarter of 1955 were up \$1,400,000,000 from the fourth quarter of 1954 and were \$5,000,000,000 above the corresponding quarter in 1953. (See also BUDGET, NATIONAL.)

Industrial Production.—The federal reserve board index of industrial production in Dec. 1954 rose to 130% of the 1947-49 average, a gain of 6 points during the last quarter of the year. There was a further gain of 2 points to 132 in Jan. 1955 and successive gains each month thereafter through September, when the index stood at 141% of the 1947-49 average, a gain of 11 points from Dec. 1954 and of 18 points from the low point reached in Aug. 1954.

AUTOMATIC MESSAGE CONVEYOR introduced in 1955 to provide credit information within one minute after the inquiry is received. Devised by Credit Exchange, Inc., of New York city, a company maintaining credit ratings of more than 300,000 retailers in the apparel industry, the device records inquiries, transcribes them on standard forms and carries the forms to clerks for immediate checking

By the end of the second quarter in 1955 the substantially uninterrupted upward trend in nondurable-goods production which had been in progress since Jan. 1954 was halted. During the third quarter of 1955 the trend in nondurable-goods production was downward and the index in September, at 125% of the 1947-49 average, was 3 points below the level in June but was 12 points above the Jan. 1954 level. After July 1954 the trend in durable-goods production was continuously upward through Sept. 1955, when the index reached 160% of the 1947-49 average, a gain of 25 points from the July 1954 low and of 5 points during the third quarter of 1955 as compared with the 3-point third-quarter decline in nondurable-goods production.

Employment.—Total employment declined slightly in Sept. 1954, dropped sharply during the fourth quarter of 1954 and continued to drop through Feb. 1955. The total number employed at the low point in Feb. 1955, as reported by the department of labour, was 59,938,000. In Jan. and Feb. 1955, 5.3% of the civilian labour force was unemployed. During the following six-month period of 1955, March through August, total employment increased sharply, both in agricultural and nonagricultural employment. The number employed in Aug. 1955 was reported at 65,488,000, an increase of 5,500,000 from the February low, and unemployment had dropped to 3.3% of the civilian labour force.

The upward trend in total employment was checked in September by a sharp decline of 1,094,000 in nonagricultural employment; agricultural employment increased by 339,000. Thus, total employment in September at 64,733,000 was 755,000 below August. The total number in the civilian labour force declined also in September as the temporary entrants for the summer months returned to school in the fall. The August-September drop of 844,000 in the civilian labour force was greater than the drop in the number employed with the result that unemployment in September dropped to 3.2% of the civilian labour force. (See also **EMPLOYMENT**.)

Wages and Hours.—During the fourth quarter of 1954 and through the first three quarters of 1955 average hourly earnings of production and related workers in manufacturing crept up-

ward slowly but steadily, increasing from \$1.81 per hour in Sept. 1954 to \$1.90 per hour in Sept. 1955 as reported by the department of labour.

Average hours worked per week in manufacturing industries during the first three quarters of 1955 were 40.5 hours per week as compared with 39.5 for the first three quarters of 1954. The increase in hours worked per week occurred primarily in the durable-goods industries where the average for the first three quarters of 1955 at 41.2 hours per week was 1.3 hours per week greater than the average of 39.9 during the first three quarters of 1954. In the nondurable-goods industries, hours worked per week during the first three quarters of the year averaged 39.0 as compared with 38.8 for the first three quarters of 1954.

Average weekly earnings of production and related workers in manufacturing increased steadily from July 1954 through Sept. 1955 when average weekly earnings at \$77.90 per week were \$6.04 per week greater than the \$71.86 average in Sept. 1954 and were \$6.98 above the 1954 low in July of \$70.92. Average weekly earnings in the durable-goods industries rose from \$77.00 in Sept. 1954 to \$84.45 in Sept. 1955, an increase of \$7.06 per week as compared with an increase of \$3.33 per week in the nondurable-goods industries where the increase was from \$65.00 in Sept. 1954 to \$68.57 in Sept. 1955. (See also **WAGES AND HOURS**.)

Prices.—The department of labour's all-commodities wholesale price index fluctuated around 110% of the 1947-49 average during the first nine months of 1955, which was substantially the same level as in the corresponding period of 1954. However, there were divergent trends in the major components of the all-commodity index. The wholesale farm products index in Sept. 1955, at 89.3% of the 1947-49 average, was down 4.3 points from Sept. 1954 and was 24.1 points below the 1951 monthly average. The wholesale price index of commodities other than farm products and processed foods reached 118.4% of the 1947-49 average in Sept. 1955, an increase of 3.2 points from January 1954 and of 4 points from Sept. 1954. The parity ratio for farm prices, that is, the ratio of the index of prices received by farmers to the parity index based on average prices in the period 1910-14, dropped to 85 in Sept. 1955.

Consumer prices at retail were substantially stable throughout the first three quarters of 1955, fluctuating around 114% of the 1947-49 average, at relatively the same level as prevailed throughout 1954. (See also **PRICES**.)

New Plant and Equipment.—Business expenditures for plant and equipment, after declining throughout 1954 from the high annual rate reached in mid-1953, turned sharply upward at the first quarter of 1955. The department of commerce and the Securities and Exchange commission estimated expenditures for the fourth quarter of 1955 at an annual rate of \$29,730,000,000, an increase of \$3,030,000,000 from the previous 1953 high of \$26,700,000,000.

Expenditures for new plant and equipment in the manufacturing industries constituted roughly 40% of the total new plant and equipment expenditures in 1955. Beginning with the second quarter of 1955, the annual rate of manufacturing expenditures was stepped up through the fourth quarter of the year, when the annual rate was estimated at \$12,050,000,000, an increase in annual rate of \$1,880,000,000 from the first quarter of 1955, and of \$1,470,000,000 from the fourth quarter of 1954. Of the \$12,050,000,000 estimated annual rate of manufacturing expenditures in 1955, \$5,960,000,000 was attributed to durable-goods industries and \$6,090,000,000 to nondurable-goods industries. However, of the \$1,880,000,000 increase in expenditures in the fourth quarter from the first quarter, \$1,180,000,000 was attributable to durable-goods industries and only \$700,000,000 to nondurable-goods industries. Expenditures for new plant

ipment in mining, at \$920,000,000 in the fourth quarter of 1954, were substantially the same as in the fourth quarter of 1953. Public utilities expenditures in the fourth quarter, at an annual rate of \$4,680,000,000, and commercial building expenditures, at \$9,480,000,000, were up from the fourth quarter of 1953 by \$570,000,000 and \$1,020,000,000, respectively.

Construction.—Expenditures for new construction, after dipping slightly in Oct. 1954 from the new high level established in the second quarter of 1954, turned sharply upward during the last two months of the year and reached a new high level during the first three quarters of 1955. For the first nine months of 1955, the seasonally adjusted average annual rate was \$37,744,000,000 as compared with \$37,600,000,000 for the year 1954, indicating that the level of expenditures during the first three quarters of 1955 was slightly more than \$4,000,000,000 above the level of expenditures in 1954.

Private construction—residential nonfarm and business construction—constituted about 70% of the total, and federal, state and local government construction, the remainder. Total private construction in September, at a seasonally adjusted annual rate of \$30,200,000,000, was \$1,400,000,000 above Jan. 1955 and \$3,200,000,000 above Sept. 1954. Public construction in September, at an annual rate of \$11,800,000,000, was \$600,000,000 below Jan. 1955 but was \$400,000,000 above Sept. 1954, a low point in 1954. The bulk of the increase in the total of private construction was in nonfarm residential construction, which reached an annual rate of \$16,000,000,000 in Jan. 1955 and which high level it fluctuated during the first three quarters of 1955. (See also BUILDING AND CONSTRUCTION INDUSTRY; HOUSING.)

Consumer Credit.—Consumer credit continued to expand during the fourth quarter of 1954, reaching a new postwar high in December. The slight drop during the first quarter of 1955 was wiped out by the sharp increase during the second quarter, and the volume continued to rise through August when the board of governors of the federal reserve system reported the amount outstanding at \$33,636,000,000, a new all-time high. In each of the first eight months of 1955 the amount of consumer credit

outstanding was greater than in the corresponding month of 1954. Of the total consumer credit outstanding in Aug. 1955, 77% was instalment credit which at \$26,155,000,000 was \$3,719,000,000 greater than in Jan. 1955 and \$4,254,000,000 greater than in Aug. 1954. Of the instalment credit, 51% was automobile paper. Automobile credit outstanding in Aug. 1955, at \$13,547,000,000, was \$3,088,000,000 above Jan. 1955 and \$3,198,000,000 above Aug. 1954. Personal loans also increased throughout the first eight months in 1955, and the amount outstanding in Aug. 1955, at \$5,257,000,000, was \$463,000,000 above Jan. 1955 and \$638,000,000 above Aug. 1954. The amount of instalment loans for consumer goods other than automobiles outstanding in Aug. 1955 was \$5,762,000,000, or \$153,000,000 above Jan. 1955 and \$468,000,000 above Aug. 1954. Loans for repair and modernization during the first eight months of 1955 were smaller than in the corresponding months of 1954; the amount outstanding fluctuated between \$1,530,000,000 in March and \$1,589,000,000 in August.

Noninstalment credit during the first eight months of 1955 fluctuated between \$6,974,000,000 in March 1955 and \$7,557,000,000 in June, and the level was only slightly above that of 1954. (See also CONSUMER CREDIT; FEDERAL RESERVE SYSTEM.)

Commercial Bank Loans and Investments.—Loans of commercial banks as reported by the board of governors of the federal reserve system increased sharply during the fourth quarter of 1954, levelled off during the first two months of 1955 and increased sharply from March through September. For the first eight months of 1955 commercial bank loans averaged \$73,730,000,000 as compared with \$63,050,000,000 for the same period in 1954, an increase of \$10,680,000,000 in the 1955 average. Commercial bank investments in United States government securities after the first quarter of 1954 increased rapidly through October when the total reached \$70,200,000,000. From Nov. 1954 through Aug. 1955 commercial bank investments in government securities dropped steadily with only minor interruptions in April and May. By Aug. 1955 investments in government securities had declined to \$62,500,000,000, a decrease of \$7,700,000,000 from the Oct. 1954 level.

Sales and Inventories.—Manufacturers' sales, after dropping slowly from mid-1953 through Oct. 1954, increased in November and December and continued to increase through Aug. 1955. The drop in manufacturers' inventories which began late in the fourth quarter of 1953 was halted in the fourth quarter of 1954, remained relatively constant through the first four months of 1955 and increased slowly from May through August.

Seasonally adjusted manufacturers' sales in Aug. 1955, as reported by the U.S. department of commerce, at \$27,400,000,000 were up \$4,900,000,000 from the Oct. 1954 low and \$3,100,000,000 from Jan. 1955. Manufacturers' inventories in August, at \$44,300,000,000, were down \$2,787,000,000 from the previous high point in Oct. 1953 but were \$1,100,000,000 greater than in Jan. 1955. During the first eight months of 1955 wholesale sales fluctuated around \$9,500,000,000 and inventories around \$11,500,000,000. Retail sales during the same period fluctuated around \$15,000,000,000 and inventories between \$22,200,000,000 and \$23,400,000,000. The levels of both wholesale and retail sales and inventories during the first eight months of 1955 were substantially the same as in the corresponding period of 1954.

Corporate Profits.—Corporate profits before taxes and after taxes increased steadily throughout 1954, interrupted only by a slight levelling off in the third quarter, and rose sharply in the first two quarters of 1955. In the second quarter of 1955 corporate profits before taxes, as reported by the department of commerce, were at a seasonally adjusted annual rate of \$43,000,000,000, an increase in annual rate of \$9,300,000,000 from the second quarter of 1954, of \$7,000,000,000 from the fourth

STOCKHOLDERS at the 1955 meeting of Montgomery Ward & Co. in which financier Louis Wolfson unsuccessfully attempted to gain control of the mail-order institution

quarter of 1954 and of \$2,100,000,000 from the first quarter of 1955. Profits after taxes were at an annual rate of \$21,400,000,000 in the second quarter of 1955, an increase in annual rate of \$4,700,000,000 from the second quarter of 1954, of \$3,500,000,000 from the fourth quarter of 1954 and of \$1,100,000,000 from the first quarter of 1955.

Although dividend payments in the last two quarters of 1954 and the first two quarters of 1955 were at new high levels at annual rates of slightly more than \$10,000,000,000, undistributed profits rose sharply during the first two quarters of 1955. Undistributed profits and dividend payments in the first two quarters of 1955 were at the same annual rates, \$10,200,000,000 each in the first quarter and \$10,700,000,000 each in the second.

(V. B. B.)

Great Britain.—The year 1954 was one of exceptional business prosperity and the Christmas season one of the most active on record. Expenditure for the last quarter of the year was 7% higher (in 1948 prices) than in the last quarter of 1953.

The new year opened with business continuing at a high level, but the mood was not wholly complacent, and the causes of the boom were examined with some degree of anxiety. There was talk of inflation. The authorities decided that a brake should be applied, and on Jan. 27, 1955, the bank rate was raised from 3% to 3½%. This measure was not greatly heeded and was followed on Feb. 24 by a further increase to 4½%. The official diagnosis was made known in April, in the government's customary economic survey (Cmd. 9412). It admitted that production was high—the improvement on the preceding year was in fact unexpectedly large and continued so for a number of months. Less satisfactory was the way in which this production was distributed, too much for direct consumption and too little left for export. The report warned the nation that a payments crisis might be impending.

The budget which followed on April 19 confined itself mainly to a reduction of sixpence in the standard rate of income tax, which had the administrative convenience of taking large numbers of people out of the ranks of income-tax payers altogether. The budget was described as one of moderate incentives; it was also described as an exercise in electioneering—the general election was due on May 26. On the whole it showed plainly enough that the chancellor knew he was facing an inflationary situation.

The budget did nothing to improve the uneasy balance of Great Britain's economy. Consumption remained high, and though the balance of trade showed some improvement, this trend did not have time to establish itself. The balance was upset by a dockers' strike, the effects of which, aggravated by a strike of the railway footplate men, revealed the dangers to which the economy lay open. For a while overseas trade was severely diminished and it was widely felt that some of the lost exports could not be made good, although this view later proved too pessimistic. The number of working days lost through strikes was higher than in the preceding year, and the strikes occurred largely in key industries.

The inflationary situation was aggravated by the continued rise in wages. A substantial transfer of spending power undoubtedly occurred from individuals and companies who might be expected to save to those who were disposed to spend. The rise in wage rates in the first half of the year was substantially higher than in the corresponding period of 1954.

It took some time for the effect of increases in the bank rate on credit to be felt. In the first half of the year bank deposits showed a partly seasonal fall, but at the same time advances to customers grew, and at a more rapid rate than in the corresponding period of 1954. At the same time cash in hand, treasury bills and investments (mainly government paper) contracted, a movement contrary to that recorded a year earlier.

SHOW WINDOW of department store in The Hague, Neth., featuring U.S. products. In 1955 the store, De Bijenkorf, carried out an intensive promotion of the "American way of life" through the display and sales of U.S. goods in its stores in The Hague, Amsterdam and Rotterdam

The net result was a pronounced fall in liquidity. Yet the inflationary trend continued. Eventually the chancellor decided on a policy of action and on July 25 caused a letter to be addressed to the banks asking them to reduce their advances. At the same time he arranged that higher deposits should be required for the instalment purchase of certain goods. He also asked industrial undertakings to reduce their capital expenditure.

In the conditions prevailing in the first half of the year business was excellent. Unemployment remained at an extremely low level. The output of steel was about 7% higher than in the previous year; that of machine tools (in the first quarter) about 14% higher; that of motorcars about 22% higher, but it was significant that the number of cars exported did not show a similar expansion. The output of coal languished, the result partly of a drift of labour from the mines and partly of restrictive practices in the pits. But the general boom was reflected in the growth of the number of people in civil employment. (See also BANKING; INTERNATIONAL TRADE; LAW; STOCKS AND BONDS; TARIFFS; TAXATION.)

Byrd, Richard Evelyn (1888—), U.S. explorer and naval officer, was born at Westchester, Va., on Oct. 25. He was graduated from the U.S. naval academy at Annapolis, Md., in 1912, subsequently advancing to the rank of rear admiral, retired. An early naval pilot (1918), he was in command of U.S. naval air bases in Canada during the latter part of World War I. In 1925 he led the naval section of the Navy-MacMillan polar expedition. On May 9, 1926, he was co-pilot with Floyd Bennett on the first flight by man over the North Pole. (Later, with three crewmen, he was first to fly over the South Pole Nov. 29, 1929.) June 29–July 1, 1927, with three others, Byrd flew the Atlantic eastward from New York City. The plane was forced down near Ver-sur-Mer, Fr., after failing to land in Paris because of bad weather.

Byrd's greatest fame came as leader of a series of expeditions to the Antarctic, in 1928–30, 1933–35, 1939–41 and 1946–47. During the first he established the Little America camp in the Ross sea. In the second he nearly lost his life when he went alone at a weather base for five months. The third expedition

ited in the most extensive exploration of the Antarctic to date. The fourth, in addition to gathering important scientific data, was undertaken to train military personnel for combat in polar regions. More than 1,000,000 sq.mi. of new territory was mapped during the four expeditions. (See also *Encyclopedia Britannica*.)

Byrd's fifth trip to the Antarctic was announced in 1955. On March 28 he was appointed commander of an expedition to return in the fall of 1955 as part of the United States' participation in events of the International Geophysical year (1957-58). The first section of the expedition sailed from Boston on March 30. On Nov. 2 it was announced that Byrd had been placed in charge of the entire United States Antarctic program. He left for the Antarctic later that month.

California. Nicknamed the "Golden state" because of the importance of gold in its early history, California achieved statehood on Sept. 9, 1850. The state ranks second nationally in both area and population. A total area of 163,693 sq.mi. includes 1,953 sq.mi. of water area. California is situated at the southwestern corner of the United States. As of July 1, 1955, the estimate of California population indicated 12,700,000 inhabitants (1950 U.S. census, 10,586,223). Chief cities (with 1950 census figures in parentheses) were Los Angeles, 4,663 (1,970,358); San Francisco, 801,000 (775,357); San Diego, 446,000 (334,387); Oakland, 400,000 (384,575); Long Beach, 285,000 (250,767); Sacramento (the state capital), 158,000 (137,572); Berkeley, 115,000 (113,805); Fresno, 114,000 (96,669); Glendale, 113,000 (95,702); Pasadena, 110,079 (104,000); San Jose, 108,746 (95,280); Richmond, 90,000 (99,545).

History.—The state officers in 1955 remained Goodwin J. Knight, governor; Harold J. Powers, lieutenant governor; Frank Jordan, secretary of state; Charles G. Johnson, treasurer; Edmund G. ("Pat") Brown, attorney general; Robert C. Kirkland, controller; Roy E. Simpson, superintendent of public instruction. The electorate voted in 1954 to transfer the functions of state liquor control from the state board of equalization to a newly created state liquor department, with the former continuing its activities to tax equalization matters.

The year 1955 saw smog (combined smoke and fog) become a critical problem. Previously confined to southern California, it continued to spread despite attempted remedies including restrictions on backyard incinerators. Increased concern was shown because of the reported deleterious effects of smog and a \$5,000,000 smog research program was launched by the state.

Because of pressing highway construction needs the state gasoline tax was retained at 6 cents per gallon instead of reverting to 5½ cents per gallon as previously planned.

Unusually high summer temperatures accompanied by serious forest fires made it a destructive year in both forestry and agriculture. However, the farm labour program alleviated greatly the perennial Mexican "wetback" (illegal immigrant) labour problem by permitting more facile legal entry.

California stepped up its already accelerated manufacturing industry with expansion and new construction of factories.

The children of California hailed the opening of producer Walt Disney's \$17,000,000 "Disneyland."

California's uranium hunting population increased to figures which probably exceeded the number of gold seekers in 1849.

Education.—Average daily school attendance for budgetary purposes for 1953-54 was calculated at 1,618,942 for elementary school districts, at 152,277 for high school districts and at 98,927 for junior college districts. Social Insurance and Assistance, Public Welfare and Related Programs.—

As of July 1955 there were 268,750 recipients of old-age security payments with average monthly aid being \$66.05 per person (July 1954, 271,764 at \$68.97 per recipient). Aid to the needy blind program paid 12,242 persons average payments of \$83.76. An average of \$49.64 was paid for support of 150,904 needy children, while general home relief was provided for 26,719 cases involving 46,128 persons.

For the month of July 1955 the four California-administered social insurance programs compensated 85,800 unemployed or disabled claimants per week in a total amount of \$10,106,571 for the month. Total operating expenses for the state department of corrections for the year 1954-55 were estimated at \$21,147,334. Total population of California correctional institutions as of June 30, 1955, numbered 15,573, including 568 women. Inmates of youth authority institutions totalled 3,082 (as of Aug. 31, 1955), of which 315 were in its two schools for girls, 240 in its three forestry camps for boys, and 1,367 in its four schools for boys; the remainder were in other institutions or prisons.

Communications.—Final automobile registrations for 1954 were 4,984,516. Total expenditures by the state division of highways for reconditioning, resurfacing and construction of highways for 1954-55 were estimated at \$245,945,023 including \$28,619,105 in federal aid contributions (1953-54, \$242,266,603 including \$32,275,140 in federal assistance). Figures compiled in 1950 indicated 7,518 mi. of steam railways and 702 mi. of electric railroads in California. As of Dec. 31, 1953, the state had 464 airfields, including 219 public and 245 limited airports, with 8,183 planes based in California airports. At the same time there were 4,118 mi. of federal airways. As of Jan. 1, 1955, there were 4,979,840 telephone stations within the state.

Banking and Finance.—Total assets of the 138 state-licensed savings and loan associations operating in California (as of Dec. 31, 1954) were \$1,663,681,821, while 68 federal savings and loan associations had assets of \$1,678,556,732, and total bank debits reached \$133,807,080,000. As of April 11, 1955, California's 104 federal reserve member banks had total assets of \$18,081,137,000.

Estimated total state revenue for 1954-55 was \$1,397,477,165 (1953-54, \$1,271,447,494), and estimated total expenditures were \$1,473,292,706 (1953-54, \$1,381,400,475). California's net bonded debt (outstanding Nov. 30, 1954) was \$659,422,592. Per capita income for 1955 was calculated at \$2,020 and per capita tax at \$99.90, while state tax collections in 1954-55 amounted to \$1,265,718,000 (1953-54, \$1,214,788,000).

Agriculture.—California's gross cash farm income again led the nation during the year 1954, being \$2,519,398,000 (1953, \$2,643,950,000). Returns from livestock and poultry products aggregated \$905,299,000 (1953, \$971,250,000), and crop returns brought \$1,599,297,000 (1953, \$1,662,660,000). Government payments added \$14,802,000 to state farm income. Total value of truck crops for 1954 was \$330,620,000, field crops \$693,909,000 and fruit and nut crops \$511,268,000.

Manufacturing.—As of Aug. 1955, 1,157,300 wage and salary workers were employed in California manufacturing industries, being the highest figure since World War II. Approximately 424,300 were employed in production of nondurable goods and 733,000 in the manufacture of durable goods. At the midyear point total civilian employment was 5,172,000 while unemployment figures showed 166,000 not working. Preliminary estimates of 1954 retail trade indicated \$15,400,000,000 spent, marking a decrease of 0.3% from the preceding year's total. Public and private construction figures were estimated at 2% higher than in 1953, or \$4,056,000,000. (D. C. Cr.)

OPENING DAY AT "DISNEYLAND," near Anaheim, Calif., a children's amusement park designed by Walt Disney, creator of "Mickey Mouse" cartoons, motion-picture and television producer. The park was opened July 17, 1955

Salt	1,123,000	6,263,000	1,149,000	4,880,000
Sand and gravel	58,430,000	53,224,000	53,051,000	43,633,000
Silver (oz.)	1,036,000	938,000	1,100,000	995,000
Stone	14,514,000	18,479,000	14,375,000	17,697,000
Talc	126,000	1,133,000	121,000	2,868,000
Tungsten concentrate 60% WO ₃	2,000	8,907,000	3,000	11,361,000
Zinc	5,000	1,232,000	9,000	3,127,000
Other minerals	45,098,000	...	39,517,000
Total		\$1,392,883,000		\$1,215,130,000

*Values for processed materials are not included in the totals.

†Value included with other minerals.

Mineral Production.—Table III shows the tonnage and value of mineral commodities produced in California whose value was more than \$100,000, for 1952 and 1953 (preliminary). In 1953, the state led all others in output of borates, chromite, diatomite, mercury and sand and gravel, was second in cement, gypsum, petroleum, pumice, talc and tungsten, third in gold, magnesite, bromine and sulphur, and fourth in asbestos, natural gas and pyrite. The state ranked second in value of its mineral commodities, with 9.69% of the U.S. total in 1953.

Cambodia. An independent kingdom situated in the southern part of the Indochinese peninsula, on both banks of the Mekong river, Cambodia is bounded west and north by Thailand, northeast by Laos, east and southeast by the National Republic of Vietnam and southwest by the Gulf of Siam. Area: 65,958 sq.mi. Pop. (1954 est.): 4,100,000. The Cambodians are

Thai-speaking Khmers. Religion: Buddhist. Capital (pop., 1954 est.): Pnom Penh, 375,000. Ruler, King Norodom Suramarit premier in 1955 Norodom Sihanouk (former king and present king's son).

History.—The strange personality of Norodom Sihanouk dominated the political stage in Cambodia during 1955. The young king, in opposition to the Democratic party—which he had a majority in the assembly dissolved on Jan. 13, 1953, and was inclining farther and farther toward communism—put the case to the people in a referendum in Feb. 1955 and secured a majority for the monarchy of 909,000 votes against 1,740,000. Almost immediately, he abdicated in favour of his father Norodom Suramarit. On Sept. 11 elections were held for a new assembly: the Democrats got only 20% of the votes, and all 91 seats went to the Socialist Community party founded by Norodom Sihanouk, who became president of the council of ministers. On Sept. 25 he had a resolution passed by which Cambodia ceased to be an associate state of the French Union and became an independent sovereign state; votes were given to women, and each province was granted its own elected assembly. (Hu. DE.)

Canada. A member of the Commonwealth of Nations, Canada is a federal union covering all of North America north of the United States except Alaska. Area: 3,845,774 sq. miles. Capital: Ottawa (q.v.). Governor general, Vincent Massey (q.v.); prime minister, Louis Stephen St. Laurent (q.v.). Pop. (1951 census) 14,009,429; (June 1, 1955, official est.) 16,010,000.

History.—The year 1955 was a prosperous and eventful one for Canada. The mild recession recorded in 1954 already showed signs of terminating before Jan. 1955. Canada responded rapidly to increased industrial activity in the United States during the winter of 1954-55. Exports of Canadian base metals, lumber, pulp and paper to its southern neighbour rose substantially in the early months of 1955; coupled with a higher demand from Britain and Europe, the effect was to raise Canadian exports to the first third of the year to a figure 12% above 1954 and only just short of the all-time record. Once the favourable turn in the economic climate had been appraised, there was a renewed zest in capital investment. By mid-1955, industrial production was running 9% above the previous year. Employment in August reached the highest point in Canadian history. Unemployment figures were 25% lower than the year before. In September, Public Works Minister Robert H. Winters announced that

Table I.—Largest Cities of Canada

1955 would see a record of 125,000 housing units started. The thawing of the "cold war" brought warnings from the Canadian government that vigilance continued to be necessary. There was no sharp reduction in expenditure on national defense. The budget forecast of April indicated that defense expenditures, which amounted to 40% of the national budget of \$4,255,000,000 in 1954-55, would continue in the same general range (defense estimates for 1955-56 were \$1,775,000,000, or 42% of a total federal budget of \$4,362,000,000). While maintaining a level of defense expenditures far above any previous experience (except in times of actual hostilities), the Canadian government participated in negotiations looking toward an easing of international tension. External Affairs Minister Lester B. Pearson with a party of officials and newsmen left Ottawa at the end of September for a tour of ten countries, including a week in the U.S.S.R. and attendance at the Colombo conference at Singapore. While in the U.S.S.R. Pearson initiated discussions looking toward a trade agreement between the two countries. In August a party of Soviet farm executives toured Canada after a similar visit to the United States.

External relations were important in other fields. U.S. Secretary of State John Foster Dulles visited Ottawa in March and September, on the latter occasion discussing orderly disposal of North American food surpluses. On Jan. 26 the Canadian House of Commons voted 213 to 12 in favour of admitting a rearmcd Western Germany into the North Atlantic Treaty organization (NATO). In February, Canada participated in the commonwealth prime ministers' conference at London.

The annual budget was brought down on April 5. Finance Minister Walter Harris announced a deficit on operations for the fiscal year ended March 31, 1955, of about \$194,000,000, or 4.6% of the annual expenditure. A small deficit was also in sight for the year 1955-56, Harris said, with taxes at their current level. However, in view of the renewed economic expansion already very noticeable early in the year, the finance minister announced a substantial reduction in personal income taxes throughout the board, to begin July 1. The cut averaged, for the whole year, from 12% to 13% reduction, for 85% of Canada's taxpayers, with smaller percentages for those with high incomes. Finance Minister Harris also cut the corporation income tax rate by 2%, from 49% to 47%. The excise tax on automobiles was reduced from 15% to 10%, and the 10% excise tax on tires and tubes wiped out. There were no material changes in customs tariff rates. The minister justified his tax reductions in the face of an expected deficit on the ground that they would tend to encourage the restoration of the upward trend in Canada's economic activity. Even with reduced returns resulting from the tax cuts, he expected that business expansion in March 31, 1956, would bring government revenues and expenditures close to a balance.

A series of important meetings and negotiations between the federal government and the ten provinces was held on the subject of tax allocation and governmental responsibilities, the most important taking place in early October at Ottawa. During World War II, the federal government had found it necessary to collect such large sums from personal and corporation incomes taxes as to embarrass provincial collection of such levies, and a rental scheme was evolved under which Ottawa paid substantial annual sums for exclusive rental of such fields. When hostilities ended, these wartime agreements lapsed, but were succeeded by similar tax agreements freely entered into by most provinces. Nine of the ten provinces were operating under such agreements in 1955, but Quebec resolutely refused to sign, and obtained instead an arrangement for occupying a portion of these fields co-jointly with the federal government. The nine existing tax agreements were to expire in 1957. The conferences

in 1955 were to discuss, among other things, the evolution of a formula which might satisfy the nine provinces already in the scheme, and also the peculiar needs of Quebec. Considerable progress toward a more acceptable national formula was made, and the extensive discussions were scheduled to continue until 1957. Little headway was possible in the establishment of a national health insurance plan or in the close integration of national investment.

The year 1955 was not particularly eventful in party politics. The Liberal party in power at Ottawa under Prime Minister Louis St. Laurent lost an old Liberal seat in New Brunswick in a September by-election but in general retained its solid hold on power for the 20th consecutive year. In Alberta the Social Credit party in June lost its overwhelming representation in the legislature but remained comfortably in power with 37 seats (a loss of 15), the Liberals as chief opposition party gaining 11 seats for a total of 15.

The 500,000,000 bu. wheat crop was the fourth unusually heavy crop in five years. Added to a total of nearly 500,000,000 bu. still in storage at harvest time it brought the stocks on hand in September to 992,000,000 bu., the third highest mark in history. This succession of bumper harvests overtaxed storage capacity and opened up a serious problem of providing cash income for wheat farmers for grain, much of which had little prospect of moving off the farms for many months.

(Wd. E.)

Education.—In the school year 1951-52 there were 30,710 provincially controlled elementary and secondary schools with 93,694 teachers and 2,502,403 pupils; evening classes had 187,216 pupils and correspondence courses 24,524 pupils. Other provincially controlled schools included 13 schools for the deaf and blind with 311 teachers and 2,026 pupils and 112 normal schools with 1,205 teachers and 11,463 students. Privately controlled schools included 799 academic schools with 5,194 teachers and 100,614 pupils and 225 business training schools with 778 teachers and 18,901 day students and 16,167 evening students. Indian and territorial schools numbered 479 with 1,000 teachers and 28,045 pupils. There were 238 institutions of higher learning with total enrolment of 156,157 and university-grade enrolment of 63,499.

Finance.—The monetary unit is the Canadian dollar, with a par value of U.S. \$0.909 since Sept. 30, 1949. Under the exchange system introduced Sept. 30, 1951, all exchange transactions for U.S. dollars were conducted on a free market in which the value of the Canadian dollar ranged in the first 10 months of 1955 between a high of U.S. \$1.03687 (Jan. 14) and a low of U.S. \$0.99984 (Oct. 19). The federal budget for the fiscal year ending March 31, 1956, estimated revenue at \$4,202,000,000 and expenditure at \$4,362,000,000; actual revenue in 1954-55 (preliminary) was \$4,107,100,000, expenditure \$4,255,400,000. The net federal debt on March 31, 1955 (preliminary), was \$11,264,200,000 (1954: \$11,115,937,064). Currency in circulation on July 31, 1955, totalled \$1,509,000,000 (Dec. 31, 1954: \$1,548,000,000). The U.S. department of commerce estimated U.S. direct investments in Canada in 1954 at U.S. \$5,939,000,000, of which \$2,553,000,000 represented manufacturing investments and \$1,160,000,000 petroleum investments. The cost-of-living index stood at 120 in Aug. 1955 (1948=100).

Trade.—Exports in 1954 were valued at \$3,876,134,388 (1953: \$4,117,405,882); re-exports, \$65,644,868 (\$55,195,233); imports, \$4,093,196,338 (\$4,382,830,430). In the first seven months of 1955 exports were valued at \$2,380,000,000 (1954: \$2,163,800,000); re-exports, \$40,100,000 (\$36,600,000); imports, \$2,582,100,000 (\$2,391,400,000). In 1954, Canada's principal customers were the U.S. (60%), the U.K. (17%), Japan (2.5%), western Germany (2.2%) and Belgium (1.4%). Leading suppliers were the U.S. (72%), the U.K. (10%), Venezuela (4.1%), western Germany (1.1%) and Brazil (0.8%). Leading exports were newsprint (17%), wheat (10%), planks and boards (8.4%), wood pulp (7.0%) and aluminum and products (4.8%). Leading import groups were iron and steel and manufactures (32%), nonmetallic minerals and products (except chemicals) (15%), of which petroleum and products accounted for 8%), agricultural and vegetable products (except chemicals, fibres and wood) (13%), nonferrous metals and products (8.7%) and fibres, textiles and textile products (7.1%).

Transport and Communications.—The combined length of railway track in operation in 1953 was 58,695 mi. Passengers carried in 1954 totalled 28,188,777 (1953: 28,736,159), freight 156,739,694 short tons (176,751,636 tons). On Dec. 31, 1954, the merchant marine had 2,560 vessels (100 tons and over) aggregating 2,024,180 gross tons and 14,008 vessels (under 100 tons) aggregating 235,371 tons. In 1954, Canadian airlines flew 59-

319,191 revenue miles and carried 2,316,665 revenue passengers, 103,174,610 lb. of revenue freight and 22,161,523 lb. of mail. Highway mileage (Dec. 31, 1953) totalled 517,809. In 1954 motor vehicle registration increased by 213,917 to 3,644,589, including 2,682,430 passenger cars and 918,459 commercial vehicles.

On Dec. 31, 1953, Canada had 3,606,407 telephones or 24.4 per 100 population. On Nov. 1, 1954, there were 171 standard broadcast-band stations, 37 short-wave stations, 31 frequency-modulation stations and 24 television stations and at the end of 1954 over 1,000,000 television sets were in use.

Agriculture and Fisheries.—Total cash farm income in 1954 (preliminary) was \$2,377,834,000 (1953: \$2,776,003,000). Cash receipts from sales of livestock and poultry were \$841,535,000, grains, seeds and hay \$630,426,000, dairy products and eggs \$538,410,000, forest products (farm sales) \$83,336,000, fruits \$46,380,000 and furs \$12,192,000. Table III shows acreage and estimated production of principal field crops in 1954 and 1955. Livestock on farms (June 1, 1955) included horses 901,400, cattle 10,239,000, sheep 1,722,700, hogs 6,079,000, poultry 66,214,000. Production in 1954 (preliminary figures) included wool 8,480,000 lb., butter (creamery) 312,665,000 lb., cheese (cheddar) 82,127,000 lb. and milk 16,760,000,000 lb.

Sea-fish landings in 1954 (preliminary) totalled 1,900,512,000 lb. valued at an estimated \$82,762,000. In the year ending June 30, 1954, 6,275,000 pelts were taken, valued at \$19,288,000, of which fur farms accounted for a record 49%.

Manufacturing.—In 1953 Canada had 38,107 industrial establishments employing 1,327,451 persons who earned \$3,957,018,348; value added by manufacture was \$7,993,069,351 and gross value of factory shipments totalled \$17,785,416,854. Table IV shows the principal statistics of the ten leading manufacturing industries in 1953. Production in 1954 included steel ingots and castings 3,194,122 short tons, pig iron 2,213,433 tons, ferro-alloys 109,833 tons, cement 22,584,023 bbl. of 350 lb. each, electric power 69,136,584,000 kw.hr., passenger cars 282,038, commercial vehicles 68,114. Production of sawn timber was estimated at 7,300,000,000 bd.ft., wood pulp at 9,684,503 short tons and newsprint at 5,984,207 tons.

Minerals.—Mineral production (excluding pitchblende products) was valued at \$1,444,196,460 (preliminary) in 1954 (1953: \$1,336,303,503). Table V shows the production and value of leading minerals in 1953 and 1954. The length of oil pipelines was 4,656 mi. on Dec. 31, 1954, and in 1954 the flow of oil, including deliveries of foreign crude petroleum and products, was 174,421,388 bbl. Natural gas production totalled 122,854,500,000 cu.ft., in 1954. (J. W. Mw.)

Table III.—Principal Field Crops of Canada, 1954 and 1955

Crop	Acres		Bushels	
	1954	1955	1954	1955*

Canadian Literature.

Fiction.—For the second year in succession, new novelists definitely overshadowed the veterans in 1955. Whatever the reasons, the fact could not be denied. The most distinguished veteran to produce during 1955 was Nova Scotia's Will R. Bird, and he stuck to his well-loved and frequently limned home area.

Despite the title, *The Sky Yorkshirer*, many of the scenes were laid in Nova Scotia, and Bird conveyed, with his familiar pungency, the flavour of ordinary Nova Scotian life just before and after World War I. Novelist Constance Beresford-Howe surprised her following by delving into 16th-century English history for plot material for *My Lady Greensleeves*, which described an authentic divorce case of the period with a liveliness that just missed distinction. Lionel Shapiro used his World War II experiences for the background of *The Sixth of June*, which reported, with moving accuracy, the individual tensions and conflicts which punctuated human relations in wartime Britain. Jan Hilliard, like Will Bird, explored the Nova Scotian scene, and took *A View of the Town*, which, for humour, event and character, easily matched Nova Scotian experts like both Bird and Thomas Raddall. Miss Hilliard's town was Inverness back in 1781, and her view recreated it with gusto and guffaws.

But the newcomers so far overshadowed the veterans, in quantity and quality, that critics felt reassured about the future of the novel in Canada. And the newcomers were widely distributed, geographically. In New Brunswick, Stuart Trueman produced a rollicking story about *Cousin Elva* who ran a tourist home. In Quebec, E. M. Granger Bennett used the lives of Louis Hebert and his family to portray, with suspense and excitement, *Land for Their Inheritance*; Brian Moore used his Belfast background to project the inner spirit of an Irish spinster, *Judith Heurne*; Ian Stormont (pseudonym) used his personal scientific training to dream up a fantasy which foretold post-H-bomb life in Canada with *Tan Ming*, a princess who was imprisoned while in a coma. In Ontario, Magdelana Eggleson used her adolescent Alberta mining town experiences for the plot of *Mountain Shadows*, which involves the conflicts of nationalities; Gale Taylor delved into the conflicting loyalties of second-generation Canadian Doukhobors, one of whom was *Anastasia's Daughter*; Evelyn Weller used the evolution across half a century of her own Toronto street for the action of *Cardinal Road*. In Saskatchewan, Mary Hiemstra used her *Gull Farm* life for a graphic narrative of prairie pioneering from 1903 onward. In British Columbia, Hubert Evans drew on his intimate knowledge of Pacific coast Indians who find, because of racial discrimination, there is more than *Mist on the River* in the canneries.

Poetry.—The 1955 poetry crop was meager, suffering as usual from public indifference and publishing wariness. Lorne Pierce defined the talent of Bliss Carman with *The Selected Poems of Bliss Carman*; G. H. Needler did the same for John Galt with *Poems of John Galt*. Arthur Bourinot printed *Ten Narrative Poems* to round out his poetic collection to 24 volumes. L. Eugenie Perry of Vancouver collected her craft-worthy nature poems under the title *Green Timbers*.

Nonfiction.—The fascination of Canadian writers for history remained as unslackened as it was inexplicable. Such work topped the nonfiction list by the traditional margin, and the scope was no less wide than in former years. A list of titles indicates the impact of this kind of writing upon publishers' resources, library shelves and reading public: *Canada's Flying Heritage* by Frank H. Ellis, *Ottawa: Portrait of a Capital* by Blodwen Davies, *Regina: The Queen City* by Earl Drake, *The Struggle for the Border* by Bruce Hutchison, *The Barley and the Stream* (brewing history) by Merrill Denison, *Toronto Hydro Recollections* by E. M. Ashworth, *Foundations of Canadian Nationhood* by Chester B. Martin, *Done at Grand Island* (the Acadians) by Will R. Bird, *Saskatchewan: The History of a Province* by J. F. C. Wright.

An aspect of history is, of course, biography, and as usual Canadian writers leaned hard into this subject. Donald Creighton

n finished his two-tome life of John A. Macdonald with *John Macdonald: the Old Chieftain*; James S. Marshall reported Captain Vancouver's voyage with *Adventures in Two Hemispheres*; W. S. MacNutt recreated the Marquis of Lorne's governorship with *Days of Lorne*; D. G. G. Kerr did the same for *Edmund Head*. More recent Canadians were subjects in several books of unexpected merit, including *Emily Carr As I New Her* by Carol Pearson, *My Mother, the Judge* (Helen MacGill) by Elsie G. MacGill, *That's What I'm Here For* (Archdeacon McElheran) by Irene Brock McElheran, *Swim to Glory* (Marilyn Bell) by Ron McAllister. Roy St. George Stubbs, with a unique flair for capsule biography, produced a cond serving, *Prairie Portraits*, which comfortably stood comparison with his earlier *Lawyers and Luymen*.

The arctic, another perennial Canadian theme, was not overlooked in 1955, and several books described aspects of it. They included Roland Wild's *Arctic Command*, a fascinating report the voyages of the "Nascopie" among the arctic islands; Philip . Godsell's *Pilots of the Purple Twilight*, an equally thrilling report of arctic flying; Nan Shipley's *Anna and the Indians*, a graphic recital of northern missionary work; Fred Bodsworth's *First of the Curlews*, a moving description of far north wildlife.

Juvenile.—It is not unfair to say that children's books jumped in 1955. There certainly were fewer than in 1954, and in the whole, quality was down. Exceptions were Margaret Bryan's *The Trail of the Red Canoe*, recounting excitement in Ontario's Algonquin park; John Craig's *Wagons West*, recreating the 1842 migration of land-hungry, Indian-pestered pioneers from Missouri to Oregon; Marion Lineweaver's *The Wildlife*, catching the flavour of salt-water sailing; and Marianna MacDonald's *Smugglers Cove*, capturing both adventure and smugglers in New Brunswick. Other juveniles included *Buckskin Brigadier* by Edward McCourt, *Return of the Viking* by Eva-Lis Suonio, *Korean Boy* by Chong-Yong Pak and Jock Carroll, *Living in Canada* by Alex A. Cameron, Mary Quale Innis and Arnold Boggs. (C. Cy.)

French.—The best books published in 1955 were all in the field of history and biography. This, in recent times, is exceptional. Lately, the novel and poetry definitely had stood out among all literary genres in French Canada. In 1955, however, the contributions to these two creative fields of writing were negligible. Young poets published their first small collections, yet none of them made any deep impression, with the possible exception of Gérard Bessette with his *Poèmes temporels*, a collection of poems in which the main theme was the passing of time and which showed a Mallarméan taste for musical lines. Young novelists also put out their first novel, but none of them established himself as a genuine writer. The less mediocre novel of the year was probably Bertrand Vac's *Saint-Pépin*, a bomy portrayal of small town politicians. The best piece of creative writing was Jean-Louis Gagnon's *La Fin des haricots*, such in the style of Guareschi's novels, and a highly humorous and satirical short story assailing all forms of dogmatism. This short story was to be found in the first issue of the new periodical, *Ecrits du Canada français*, in which appeared also Robert L'Étranger's first play, *L'Etrangère*, which was lacking in dramatic tension.

Among the best books of the year were Auguste Viatte's *Histoire littéraire de l'Amérique française*, a general survey, more sociological than literary in approach, of French writing in Canada, the United States and the French colonies in America; Louis Lachance's *La Lumière de l'âme*, which was a popularization of St. Thomas Aquinas's theory of grace; and Laure Rièse's *Amé de la poésie canadienne française*, a much too conservative anthology in which were ignored some of the best contemporary poets.

Important biographies appeared in 1955, namely: Marcel Trudel's *Chiniquy*, the first major work on this much-discussed religious reformer; Léon Pouliot's *Mgr Bourget et son temps* (the first volume of four or five), which was not only a biography of the bishop of Montreal but also a history of the situation of the Roman Catholic Church in Montreal in the middle of the 19th century; Adrien Thério's *Jules Fournier*, which did not do justice to one of the best polemicists of the beginning of the 20th century. The success-vocalist Félix Leclerc also published a fanciful autobiography, *Moi, mes souliers*.

Much attention was paid throughout Canada to the bicentenary of the deportation of the Acadians, which was also marked by the publication of Robert Rumilly's *Histoire des Acadiens* (in two volumes) and of Bona Arsenault's *L'Acadie des ancêtres*. Gustave Lanctôt collected, in *Une Nouvelle-France inconnue*, monographs on various aspects of the early history of Canada, the most important of which was *Servitudes de l'Eglise sous le régime français*. Merrill Denison's *The Barley and the Stream* was also published in French under the title of *Au pied du courant*.

On the whole, the year's crop was poor. (See also LITERARY PRIZES.) (G. SR.)

Canals and Inland Waterways. By 1955, approximately 23,000 mi. of inland and intracoastal waterways of the United States had been improved by the federal government. Major arteries in the inland and intracoastal waterway system had minimum 9- and 12-ft. channel depths needed by modern barge navigation. The traffic passing through the waterways had grown from 8,600,000,000 ton-miles in 1929 to 75,100,000,000 ton-miles in 1953, an increase of 800% in 25 years, and to 82,500,000,000 ton-miles in 1954. Total inland water-borne commerce in the U.S. in 1954, including that on the Great Lakes, was as shown in the table.

The federal investment chargeable to these waterways totalled about \$1,900,000,000 through fiscal year 1954. It was estimated on a conservative basis that transportation savings had exceeded that amount in the same 25-year period.

The Mississippi river system is the most extensive part of the nation's inland waterway network. The system links with dependable navigable channels, the Great Lakes on the north and the Gulf of Mexico on the south. Improved tributaries of the Mississippi river extend like broad turnpikes to rich sources of raw materials and to great centres of industry.

One of the most interesting improvements under way in the fiscal year ending June 30, 1956, was on the Calumet-Sag navigation project, which, when completed, would provide a more adequate barge navigation channel between the Illinois waterway at Joliet, Ill., and Lake Michigan southeast of Chicago. In other words, it would provide a better connection between the Mississippi river navigation system and the Great Lakes.

The existing 60-ft.-wide Calumet-Sag channel, restricted by many low bridges, limited tows to only one or two barges. By widening the channel to 225 ft. and altering, rebuilding or removing obstructive rail and highway bridges, modern tows of from six to eight barges and carrying 6,000 to 10,000 tons would be able to operate. Congress appropriated \$4,000,000 for initiation of construction on the Cal-Sag improvements during fiscal year 1956. The initiating phase of the operation included dredging in the western part of the Calumet-Sag channel and work on

Atlantic coast waterways	23,091,189,000 ton-miles
Gulf coast waterways	12,479,509,000 "
Pacific coast waterways	4,317,574,000 "
Mississippi river system	42,609,492,000 "
Great Lakes system	91,174,887,000 "
Other waterways	6,075,000 "
Total	173,678,726,000

the altering of two rail bridges.

Another improvement project which was under way on the inland waterways was that of modernizing the Ohio river navigation locks and dams. The Ohio river, a tributary of the Mississippi river, had been improved by the federal government by a system of 46 locks and dams, extending from Pittsburgh to the mouth of the river near Cairo, Ill., a distance of approximately 981 mi. The project contemplated the replacement of this lock and dam system with one of 21 structures. Five of the existing structures would be retained with improvements, and 16 new replacement structures would be constructed.

During 1955 work was under way on three of the contemplated new structures: New Cumberland locks and dam, replacing existing locks and dams 7, 8 and 9; Greenup locks and dam, replacing existing locks and dams 27, 28 and 29; and Markland locks and dam, replacing existing locks and dams 35, 36, 37, 38 and 39. The new structures would comprise a nonnavigable dam and two parallel locks, 110 by 1,200 ft. and 110 by 600 ft. in size, at each of the three locations. (S. D. S.)

Canada.—The world's deepest causeway, linking Cape Breton Island to the Nova Scotia mainland, was officially opened on Aug. 13, 1955. The Canso causeway is built on 10,000,000 tons of rock fill blasted out of Cape Porcupine, a mountain conveniently situated within a few hundred yards, and runs in an elongated figure S, 4,500 ft. over water, from Auld cove to Balache point. A two-lane highway, single-track railway and pedestrian walk take up its 80-ft. width which broadens to an 800-ft. base at its widest point. About 21 mi. of railway diversion by the Canadian National railways was involved in the \$20,000,000 project, as well as the inclusion of a canal to handle ship traffic through the strait. The navigation lock is 820 ft. long, 80 ft. wide and 32 ft. deep and is crossed by a swing bridge. The Strait of Canso no longer exists, having been replaced by two landlocked bays. The canal, dug out of the shore on the Cape Breton side, serves as the connecting waterway between the Atlantic ocean and the Gulf of St. Lawrence.

Construction was begun on the St. Lawrence seaway project in Oct. 1954, with a start made on the excavation of a navigation channel and the building of a dike between the Jacques Cartier and Victoria bridges at Montreal. Subsequently, more than 20 contracts approximating \$40,000,000 were let out of the \$215,000,000 Canada had earmarked for its share of the seaway undertaken jointly with the United States. Projects under way included a canal and lock, 768 ft. long, 80 ft. wide and 30 ft. deep, at Iroquois in the International rapids section, at a cost of \$6,470,000; dredging Lake St. Louis and Lake St. Francis; and excavation of an overland part of the seaway channel in the Lachine area. The 1,200-mi. 27-ft.-deep channel, extending from the head of the Great Lakes to the Atlantic ocean, was expected to be ready for opening of navigation in the spring of 1959.

The amount of freight transported through the Canadian canals during 1954 totalled 30,070,701 short tons compared with the record of 33,373,064 tons established in 1953. Other comparative figures, with 1953 in parentheses, were: vessel passages, 25,292 (27,563); passengers carried, 116,231 (112,082). Of the vessel passages, 83.3% were of Canadian or British registry, 3,145 flew the U.S. flag and the remaining 1,081 were registered in other countries. Expenditures were \$7,793,748 (\$8,394,586); revenues, \$1,599,328 (\$1,594,890). (W. H. V. A.)

Great Britain.—The seventh annual report of the British Transport commission was submitted to the minister of transport and civil aviation on June 24, 1955. Total traffic carried on the nationalized waterways in 1954 declined by 463,000 tons to a level of about 12,250,000 tons. Slight increases in carryings of liquids in bulk to nearly 2,000,000 tons and of general mer-

CANAL IN VENICE (It.) drained in Feb. 1955 to permit the removal of refuse and silt from its bottom. Workmen are standing under the famous Bridge of Sighs

chandise to about 4,000,000 tons were offset by a decline of about 600,000 tons in coal traffic to 6,300,000 tons, 9% below the 1953 level. There was a deficit of £119,000 on waterway operating, against £83,176 in 1953. In carrying activities, the deficit was £80,000 against £35,408 in 1953.

German Federal Republic.—Clearing and restoration work was continued and the total length of navigable inland waterways was brought up to 3,465 km., consisting of 967 km. of canals and 2,498 km. of navigable rivers. Work proceeded upon the enlargement of the Dortmund-Ems canal including a scheme for dredging to 2.5 m. (by the end of 1958) to accommodate 1,000-ton ships; upon the canalization of the upper Rhine; and upon the building of the Rhine-Main-Donau (Danube) waterway. Total traffic in 1954 slightly exceeded that of 1936. On the Kiel canal alone, traffic in 1954 was double that of 1936.

Pakistan.—The Kotri barrage across the Indus near Hyderabad was opened with the objects of controlling the flow, preserving navigation and irrigating more than 2,700,000 ac. of formerly unproductive land; 43 sluice gates (each spanning 100 ft.) and a navigation lock with a pair of lifting and rotating gates were fitted into the main barrage length of 3,000 ft. The barrage was made of concrete with stone facings. It was announced that among other benefits the barrage would ensure the water supply of both Hyderabad and Karachi to be substantially increased and a reserve of hydroelectric power would become available.

Iraq.—The Ramadi barrage on the Euphrates river was brought to the ultimate stage of construction, thus completing the Habbaniya flood scheme. The main objects of the scheme were the control of dangerous floodwaters and the irrigation of desertland.

Suez Canal.—The Canal company decided to construct two bypasses immediately, one at Port Said and the other at Kab-

d also to proceed with the first section of a two-part scheme for widening and deepening the canal, with the object of making possible the passage of 45 to 50 ships a day instead of the existing maximum of 40 ships, and also to enable large tankers, averaging 36 ft., to proceed at normal speed without causing excessive erosion. It was decided to make the Port Said bypass 3 km. long, on a line nearly parallel to the main canal, by extending the Hussein basin, and to do the work at Kabret by a new excavation on a length of 3.7 km., to be dug out in the southern part of the Great Bitter lake parallel to the maritime canal. It was decided to proceed at once with widening and deepening those parts of the canal where the cross section was less than 1,256 sq.m. and to defer, for the time being, certain proposed works where the cross section was greater, but with the ultimate object of giving the canal a wetted cross section varying according to district from 1,475 to 1,550 sq.m. See also ELECTRICAL INDUSTRIES; IRRIGATION; RIVERS AND HARBOURS.) (A. H. J. B.)

Canary Islands: see SPAIN.

Cancer. The term cancer is applied to all malignant tumours and this includes sarcomas—cancers arising in connective tissues (bone, tendon, muscle, etc.)—as well as the much more numerous carcinomas originating in the skin, the tissues lining the digestive and respiratory systems and the glandular structures. Malignant diseases involving the blood-forming tissues—leukemia, Hodgkin's disease and lymphosarcoma—are regarded as closely related to cancer.

Statistical Trends.—During 1955 in the United States cancer claimed 243,000 lives, a rate of 148 per 100,000. Although the crude death rate showed an increase over the figure for the previous year, the age-standardized death rates for most types of cancer continued to decline or to show no significant change. Cancer of the lung continued its striking increase, the burden of which was borne largely by males. The favourable trends noted for cancer in general among women resulted in important measure from improved curability of cancer of the uterus, to which the nation-wide program of public education and more widespread detection methods contributed.

Financial Support.—The national anticancer crusade of the American Cancer society was supported by voluntary contributions amounting to \$24,450,000, of which 28%, or \$6,846,000, was allocated for support of fundamental and clinical research and for the training of young investigators and physicians.

The federal government appropriated \$24,828,000 for its program of research and control, of which \$16,809,000 was in support of laboratory and clinical investigations. Contributions to the Damon Runyon fund, exclusively allocated to research support, totalled approximately \$1,500,000.

Education.—Education of the public stressed the early signs and symptoms of cancer, the importance of early diagnosis and the value of periodic physical examinations. Opinion surveys disclosed that those who know most about cancer have the most realistic and least fearful attitudes toward it, while those who know least about it are, in general, the most fearful.

Facilities.—The American College of Surgeons reported the existence of 506 approved cancer consultative (diagnostic) and treatment clinics and 135 approved cancer consultative clinics. Even approved cancer hospitals were listed. About 25 radioactive cobalt irradiators were operating, most of them installed within the past two years. Research was being carried on in laboratories and hospitals, many of them associated with universities, in more than 215 institutions.

Advances.—Further experience with the vaginal cytologic method of diagnosis (smear diagnosis) confirmed its value in

disclosing cancer of the uterus, often in a very early stage when the rate of cure is as high as 80%. It became increasingly apparent that wide application of the test could sharply reduce deaths from uterine cancer, the leading cause of cancer deaths among women. Further study of cells in the vaginal secretion suggested a means of determining the best way of treating cancer of the neck of the womb—by surgery or by irradiation—in individual cases. Since the nucleus appears to control cell division, a characteristic feature of cancer, much research interest was focused on the minute chemical processes of the cancer cell, especially on how the nuclear substance is formed. Such studies made it possible to construct for the first time a model of one of the important components of the chromosomes, deoxyribosenucleic acid B. Numerous investigations of the chemical make-up of tobacco and its combustion products were undertaken and it was reported that benzpyrene, a cancer-inciting chemical, had been identified in the ash of cigarette paper.

The compound haematoporphyrin concentrates in tumour tissues (and in a few normal tissues in which cell division is active); by examining organs affected by cancer with ultra-violet light after the compound had been given to the patient, it was possible to determine with precision the extent of disease. The usefulness of carefully planned and selected ultraradical operations for extensive cancer became more firmly established. In one clinic 12% of women with advanced cancer of the pelvis untreatable by any other means were found to be alive and without evidence of cancer five years after removal of all the pelvic organs. In other clinical studies, the pituitary gland, located at the base of the brain, was removed in order to eliminate all possible sources of growth-stimulating hormones as a means of controlling rampant cancer of the breast and prostate. Some investigators held that improvement followed in about half the cases, while others were less enthusiastic.

A follow-up report on the Los Angeles county (Calif.) chest X-ray survey conducted about five years earlier disclosed that of the chest tumours discovered and operated on, 75% were removable and that 36% of this group were alive and well three years later. These figures were decidedly more hopeful than the usual experience with cancer of the lung and they gave strong support to the value of routine chest X-rays.

A review of recent developments in the chemotherapy (drug treatment) of cancer revealed that 14 chemical compounds, 4

PREPARING FROZEN TISSUE SECTIONS for cancer diagnosis at Brookhaven National Laboratory, Upton, N.Y., in 1955. The pathologist on the left is operating a freezing microtome in his left hand and a slicer, which shaves tissue thin enough for microscope use, in his right; the technician on the right is dyeing the slices so that individual cells may be easily identified

types of hormones and 5 radioactive isotopes were, with varying success, restraining the course of leukemia, Hodgkin's disease, lymphosarcoma, multiple myeloma, polycythaemia and cancer of the lung, ovary, thyroid, breast and prostate. While the results were unpredictable and usually temporary, they represented an epochal advance, the more remarkable for having been achieved in the space of 15 years. (See also BLOOD, DISEASES OF THE; SURGERY; X-RAY AND RADIOLOGY. (CH. C.)

Candy. More than 1,500 confectionery manufacturers in the United States produced approximately 2,700,000,000 lb. of candy in 1955, valued at \$1,100,000,000 at the wholesale level and almost \$2,000,000,000 at the retail level. This compares with 2,267,000,000 lb. valued at \$1,019,000,000 at the wholesale level in 1954. Almost 100,000 persons were employed in candy production and about 75,000 more in selling and distributing through wholesale channels. More than 2,000,000 retail outlets in the United States sold confectionery products.

The most significant development in the candy industry during the year was the levelling off of the cocoa bean market at the 30 to 35 cents per pound price range. This contrasted with an unparalleled fluctuation in the price of cocoa beans in the previous year, when a high of 72 cents per pound was reached.

There was no material change in candy consumption in 1955, with the American consumer buying approximately 16½ lb. of candy per person per year.

Major developments of the year were: (1) the continued increase in importation of confectionery products from abroad, especially from England; (2) the planning of a promotional campaign by the candy industry to overcome the propaganda of diet faddists; (3) continued liquidation of smaller manufacturing plants and mergers of others with larger operations in other fields; (4) interest shown by the industry in automation and automechanization of its production facilities; (5) greater interest in research and product development; (6) further emphasis on sanitation in the candy plant; and (7) continued and increasing use of hard-fat coatings.

The five-cent bar goods business again showed a decline, while ten-cent candy sales enjoyed another increase; as the year drew to a close the dime-bar business amounted to more than 30% of total bar goods sales. The sale of package goods in the price range of \$1 or more per pound remained relatively stable, showing only a 2% decrease in poundage. Sales of package goods in the retail price class of 50 to 99 cents per pound also declined.

Imports of sugar candy and confectionery into the United States increased to 20,000,000 lb. valued at more than \$8,000,000. This compares with 19,537,000 lb. with an import value of \$7,310,000 the year before. The United Kingdom accounted for approximately 70% of all candy imports. Exports of candy and chocolate from the United States continued to be negligible.

(D. Gw.)

Cane Sugar: see SUGAR.

Canning Industry. The United States and territorial pack of canned fruits, vegetables, juices, specialties, milk, meat and fish was approximately 610,000,000 cases during the 1954-55 season, according to the National Canners association. This quantity was 18,000,000 cases less than the large pack of 1953. Two of the seven groups of canned foods, canned fruits and canned fish, showed slight increases in production in 1954 compared with 1953. Each of the other major groups of canned foods registered slight declines from 1953. The pack of various canned foods from 1939 through 1954 is shown in Table I.

Production of canned baby foods in the U.S. in 1954 again registered a new high with a pack of 160,558,000 doz.—3%

above the 1953 production.

The quantity of poultry canned or used in canning during 1954 reached an all-time high of more than 230,000,000 lb.—24% above the 185,000,000 lb. canned in 1953. Poultry canned during the first six months of 1955 was 8% more than canned during 1954 in the same period.

The 1,130,000,000 lb. of fish canned in 1954 by U.S. canners was approximately one-fourth of the total catch of all fish. Ninety-nine percent of all tuna caught in 1954 was canned, 90% of the sardines and 80% of the salmon.

About 45% of the total acreage of all vegetables produced in the U.S. in 1954 was processed, and about one-fifth of the U.S. 1954 production of all fruits was canned.

The 11 major vegetables produced for processing in the U.S. in 1954 had a farm value of \$244,000,000. The farm value of the fruits canned in the U.S. in 1954 was \$133,000,000.

Canned food exports from the U.S. in 1954 totalled 788,000,000 lb. with a value of \$117,000,000. The 1954 export tonnage of canned foods was 8% above 1953 and the dollar value was 5% above 1953. Canned fruits, vegetables and juices represented 72% of all U.S. canned foods exported in 1954, compared with 67% in 1953. Exports of canned foods during the first six months of 1955 were 14% above canned food exports during the same period of 1954. Canada was by far the most important foreign market for U.S. canned fruits, vegetables and juices in 1954, taking about 17% of all U.S. exports of the commodities. The three next most important export markets for these commodities were Cuba, western Germany and the United Kingdom.

The per capita consumption of canned foods of all kinds in the U.S. during 1954 was estimated to be about 130 lb. The per capita consumption of selected groups of canned foods from 1939 to 1954 is shown in Table II.

Table I.—Production of Various Canned Foods in the U.S.
(In 000,000 of standard cases)

*Derived by U.S. Department of Agriculture from data on production and utilization from the annual supply of each food (production plus carry-over stocks plus imports) are deducted exports, government purchases and carry-over stocks. The residue is considered to be civilian consumption. This is divided by estimated population to determine per capita consumption.

†Estimated on the basis of total population, rather than on the population of children. On the basis of the number of children under the age of 3 years, consumption of foods in 1954 amounted to about 55 lb. per child a year.

‡Preliminary.

Source: U.S. Department of Agriculture, Agricultural Marketing Service.

During 1954 retail prices of canned fruits and vegetables averaged 104% of the 1947-49 average compared with 112.6% for all foods. During the first 8 months of 1955 the retail price index declined slightly to an average of 103.2% while the all foods index stood at 111.1%. Wholesale price indexes during 1954 reflected the relatively higher level of canned fruit prices compared with canned vegetables. However, during the first 8 months of 1955 wholesale prices of canned fruits and vegetables declined about 1½% while prices of canned vegetables increased slightly.

During 1955 extensive tests were conducted by the Federal Civil Defense administration in co-operation with the U.S. Atomic Energy commission and the canning industry to determine the effects of large-scale exposure of canned foods to gamma radiation. These tests revealed that canned foods on shelves or in basements about a mile from the blast were perfectly safe for human consumption immediately following a nuclear blast of nominal size. The test blast was the equivalent of 30,000 tons of T.N.T., or about 1½ times the strength of the Hiroshima bomb. Canned and glass-packed foods in houses and other structures as close as 4,700 ft. from the shot tower were substantially free of radioactivity. There was no bulging or bursting of containers from blast pressures. At 5,500 ft. canned and glass-packed foods were exposed in commercial fibreboard boxes on the ground surface with no protection. Although case surfaces at this distance were scorched and one case burned, the contents were undamaged, showed no induced radioactivity, and were found suitable for immediate use following the blast.

Tests made to determine the effects of exposure on vitamin content of canned foods exposed in shallow trenches within a fourth of a mile of the shot tower showed that niacin and riboflavin were completely unaffected in many of the products tested while sustaining only very minor losses in others. There was a loss of carotene in the vegetables and fruits tested. Nearly all of the products retained more than 80% of their thiamine and more than 90% of their ascorbic acid. The vitamin content of all the products tested was still well within the range ordinarily found in commercial production, and comparison with recommended daily allowances for each of the vitamins showed that canned foods normally considered good sources for one or more of these vitamins could still be regarded as good sources after exposure in this manner to the effects of intense radiation.

Cartography. International.—The Pan American Institute of Geography and History held its sixth general assembly in Mexico City, Mex., July 25-Aug. 3, 1955. Each country reported on recent advances and committees adopted resolutions on topographic maps, aerophotogrammetry, aeronautical charts, surveys of urban areas, and standardization of terms and terminology. A United Nations regional cartographic conference for Asia and the far east was held at Mussoorie, India, in February, attended by representatives of 19 countries and various international organizations. The role of mapping in development plans for the national economy was stressed. Standardized methods of triangulation, measurement, surveying, aerial photography and types of equipment were discussed, with countries exchanging valuable data on advances achieved.

Western Hemisphere.—The first sheets of the *National*

Atlas of the United States, showing the standard deviation of monthly average temperature, were published by the U.S. weather bureau. The Earth Sciences division, National Academy of Sciences-National Research council published "Map Standardization for a Loose-Leaf National Atlas." The U.S. Geological survey completed mapping of Kentucky at 1:24,000 scale. A map of "Uranium Deposits of the United States" at 1:5,000,000 scale proved to be a best-seller. The U.S. Coast and Geodetic survey announced completion of the arc of triangulation between Point Barrow and Demarcation Point on the Alaska-Canada boundary, thus finishing the trigonometric survey of the entire Alaskan perimeter. Rand McNally and Co. published a centennial anniversary edition of the cosmopolitan *World Atlas*. The Scripps Institution of Oceanography mapped an undersea mountain chain 500 mi. long and 100 mi. wide in water 15,000 ft. deep in the Pacific ocean between Clipperton and the Revilla Gigedo Islands.

The National Air Photographic library reported that Canada was almost completely covered by aerial photographs of which about two-thirds were vertical photographs. Maps and aeronautical charts at 1:500,000 scale provided complete coverage of that country. Noteworthy special-purpose maps produced in Canada included: "A Geological Map of Newfoundland" at 1:760,320 scale published by the province; "Mineral Map of the Province of Quebec" at 1:7,600,000 scale published by the Quebec ministry of mines; and "Principal Mining Areas and Producing Mines" at 1:7,603,200 scale published by the Geological Survey of Canada.

The National Cartographic Institute of Cuba published six topographic maps at 1:20,000 scale covering Havana. The Military Cartographic department of Mexico published 13 sheets in the Valle de Mexico and 6 sheets in the Isthmus of Tehuantepec at 1:25,000 scale. A new shaded-relief map of Honduras at 1:500,000 scale was completed by the Honduran government. Ten maps at 1:50,000 scale were printed by El Salvador: 4 sheets were in work, and 30 were planned. A fine example of shaded relief is depicted on the "Preliminary Map of the Department of Cundinamarca," Colombia, at 1:250,000 scale, published for the Bank of the Republic. A "Geological Map of the Republic of Venezuela" in four sheets at 1:1,000,000 scale was published by the government of that country.

The National Council of Geography of Brazil published a summary of technical work by the Division of Cartography. The Military Geographic Institute of Uruguay completed 37 maps at 1:50,000 scale with two being in work. A 1:200,000-scale map of Paysandu department was also produced. The Argentina National Meteorological service reported that 100 sheets of the "Climatic Atlas of Argentina" had been completed. The Military Geographic Institute of Chile reported complete map coverage of the country at 1:250,000 scale.

Europe.—Volume iii (northern Europe) of *The Times Atlas of the World* was published in April. The remaining four volumes of this outstanding contribution were to be published at the rate of one volume a year until completed in 1959. The Society of Antiquaries published two sheets of the "Tabula Imperii Romani" at 1:1,000,000 scale: sheet HI 33 Lepcis Magna and HI 34 Cyrene. The Military Geographic Institute of Belgium completed production of a new type R (rapid) series at 1:50,000 and 1:100,000 scales, compiled from old survey data and recent cultural information. The Touring Club of Italy was producing a new loose-leaf edition of the *International Atlas* to contain 175 pages of maps and a 250-page index. The date for completion was 1957. Three contoured maps of Stockholm at 1:50,000 scale were published by the National Map Service of Sweden. Recently published maps of the *Atlas of Sweden* included: 19-20, "Glaciation and Changes in Level in Quaternary

Age"; 21-22, "Striae, Terminal Moraines, Ice Recession Lines"; and 73-74, "Production and Consumption of Wheat and Rye." The Geodetic Institute of Denmark published volume 1 (Nord Jylland) of the *Atlas of Denmark* at 1:100,000 scale.

The German Democratic Republic (East Germany) was producing a special map series at 1:5,000 and 1:10,000 scales. The 1:5,000 scale experimental mapping program which began in 1952 in Hungary was officially adopted as the standard base for future mapping. The Cartographic Service of Czechoslovakia had a topographic mapping program underway to completely map the country at 1:10,000 scale. Industrial areas were to be mapped at 1:5,000 scale. New maps published in the U.S.S.R. included a physical map of the U.S.S.R. and an administrative map of the European areas of the country at 1:4,000,000 scale; and administrative maps at 1:5,000,000 and 1:8,000,000 scales of the U.S.S.R. Political and administrative maps at medium and small scale were published for Smolensk, Sumy, Chuvash, Tatar, Archangel, Kalinin, Penza, Sverdlovsk and Stalingrad. Volumes 24-32 of the *Great Soviet Encyclopaedia* included maps on the Leninabad, Leningrad, Merv, Minsk, Mogilev, Molodechno, Molotov, Moscow, Murmansk, Namangan, Nikolayev, Nizhne-amur, Novgorod, Novosibirsk, Odessa, Omsk, Orlov, Osh, Pavlodar and Penza *oblasts*; Nagorno-Karabakh autonomous *oblast*; the Mordova A.S.S.R. and Novaya Zemlya.

Asia.—A working party of the UN Economic Commission for Asia and the Far East met in Bangkok, Thailand, Sept. 12-24, 1955, to standardize hydrographic terminology.

In Israel, the ZVI Friedlander Qiryat Haiyim prepared a communications map of that country at 1:340,000 scale. Administrative divisions of Iran, as of 1953, were depicted on a 1:2,000,000 scale map made by the Iranian ministry of the interior. The harbour of Rangoon was charted at 1:3,600 scale by the board of management for the port. A land utilization map of Penang, Malaya, was published by the Malayan Survey department. A city plan of Johore at 1:6,366 scale was published by the city's survey. In the People's Republic of China, a long-term research project of field survey and mapping of the upper and middle Yellow river basin was initiated by the Institute of Geography, Academia Sinica. This organization also began a field survey of soils and water conservation in the northwestern provinces.

Africa.—The (British) Directorate of Colonial Surveys in co-operation with local survey departments was progressing in mapping Africa, as follows: at 1:50,000 scale preliminary plots in Basutoland, Nigeria, Northern Rhodesia, Nyasaland, Swaziland and Tanganyika; at 1:125,000 scale in Bechuanaland, Somaliland Protectorate and Tanganyika. Maps at 1:1,000,000 and 1:2,000,000 scales were prepared for Cameroons under U.K. trusteeship. A map of 1951 population distribution in South Africa was published at 1:1,500,000 scale by the South African government printer. The department of the surveyor-general at Salisbury published a hypsometric map of Rhodesia and Nyasaland at 1:3,000,000 scale.

Two soil maps were published: "Soil Regions of Ethiopia" at 1:4,500,000 scale by the ministry of education; and a provisional map of soils at 1:2,000,000 scale by the Mozambique Centre of Scientific Research.

Oceania.—The Australian Institute of Cartographers published the first issue of its official magazine, *Cartography*, in Dec. 1954.

The Australian National Mapping office was producing a new series of aeronautical charts at 1:1,000,000 scale covering the entire continent (as a contribution to the International Civil Aviation organization standard world aeronautical chart). A new Australian Geographical series at 1:1,000,000 scale was expected to be completed in two years; 18 out of 58 sheets had been published. Special maps had been published of Antarctica at

1:10,000,000, of Papua and New Guinea, and of Australia (four sheets) at 1:2,534,400 scale and of the Northern Territory at 1:2,000,000 scale. In the last five years, Australia had prepared basic planimetric and photomap coverage for more than 25% of the country.

The (British) Directorate of Colonial Surveys produced three sheets of a 1:50,000-scale sketch map of Guadalcanal, in the Solomon Islands.

Two sheets at 1:500,000 scale of Sarawak and Brunei were published by the Land and Survey department at Kuching.

An atlas "Indonesia Dan Dunia", was published in Djakarta. (See also COAST AND GEODETIC SURVEY, U.S.; GEOLOGICAL SURVEY, U.S.; NATIONAL GEOGRAPHIC SOCIETY.) (W. B. BR.)

Cement. In 1954, world output of cement increased 194,000,000 metric tons (213,850,000 short tons) as reported in MINERAL AND METAL PRODUCTION AND PRICES. The U.S. output was 23.8% of the total.

United States.—The accompanying table is based on U. S. bureau of mines reports. Preliminary figures for 1954 indicate

Cement Industry in the U.S.

(Millions of barrels, 376 lb. each)

	1946	1947	1948	1949	1950	1951	1952	1953	1954

that 157 plants utilizing 92% of their annual capacity produced 271,277,000 bbl. of portland cement and shipped 274,096,000 bbl. Exports totalled 4,925,714 bbl. Year-end stocks were down to 16,722 bbl. Plans announced at the beginning of 1955 were for expansion by 20,000,000 bbl. during 1955. Output in the first half of 1955, using 95% of capacity, was 11% more than the output in the first half of 1954, and shipments were 11% greater. (F. E. H.)

Census Data, U.S. The total population of the United States, including members of the armed forces overseas, was estimated at about 165,762,000 Sept. 1, 1955, by the bureau of the census. This figure represented an increase of 14,630,000, or 9.7%, from April 1, 1954, the date of the last census, and an increase of 2,818,000, or 1.7%, over the estimate for Sept. 1, 1954.

Between the 1950 census and July 1, 1955, the most recent date for which estimates of the population classified by age had been made, the population, including overseas armed forces, increased by about 14,116,000, or 9.3%, to a total of 165,200,000. The rate of growth of some of the age groups was substantially greater, however, particularly the younger age groups and the elderly. The number of children 5 to 9 years old increased by about 30%, or more than three times the average for all ages, and those 10 to 14 years old gained approximately 2

During this period. The number of persons 65 years old and over increased by about 16%. Changes in the population, including armed forces overseas, between April 1950 and July 1955, by broad age groups, are given in Table I.

Table I.—Composition of U.S. Population, by Age, 1955 and 1950

Age	Population including armed forces overseas		Change, April 1950 to July 1955	
	July 1955	April 1950	Number	Per cent
All ages . . .	165,248,000	151,132,000	+14,116,000	+9.3
Under 5 years . . .	18,305,000	16,164,000	+2,141,000	+13.2
5 to 13 years . . .	28,096,000	22,154,000	+5,942,000	+26.8
13 to 17 years . . .	9,238,000	8,435,000	+803,000	+9.5
17 to 24 years . . .	15,106,000	16,081,000	-976,000	-6.1
24 to 44 years . . .	46,946,000	45,385,000	+1,561,000	+3.4
44 to 64 years . . .	33,429,000	30,720,000	+2,709,000	+8.8
64 years and over . . .	14,128,000	12,195,000	+1,933,000	+15.9

Population by Age.—The effect of the rapid growth of the population of elementary school age was generally well known throughout the country. Of considerable importance, moreover, was the fact that there were considerably more than 18,000,000 children of preschool age (under 5 years)—one-eighth more than in 1950. Most of these children would be entering school during the next five years, and they would add considerably to the problems already facing many school administrators and local boards of education. (A rather smaller number of children would be leaving school by dropout or graduation over this period.)

Persons of high school age (14 to 17 years) showed moderate increases while the college age population (18 to 24 years) declined between 1950 and 1955. The 14-to-17-year age group increased by about 800,000, or 9.5%, from 1950, and it was anticipated that this group would continue to grow at a fairly rapid pace for several years to come. The college age group, on the other hand, was expected to show only very slight increases for the next several years. After 1960 this group would begin to grow more rapidly, as the larger number of persons born during World War II and the postwar years replaced the smaller number born in the middle and latter half of the 1930s. The population 65 years and over continued to show rapid gains, increasing by about 1,900,000 between 1950 and 1955. There were about 14,100,000 persons in this group on July 1, 1955. In comparison, there were 12,200,000 in 1950 and about 10,000,000 in 1940. At the beginning of the century this group numbered about 3,000,000.

Civilian Population of States.—Most of the states shared the 12,650,000 growth of the civilian population in the continental United States between April 1950 and July 1955. The total civilian population in 1955 was 162,284,000 as compared with 149,634,000 in 1950. (The total number in the armed forces in the United States and overseas on July 1, 1955, was about 2,964,000, but detailed information on geographic distribution of the armed forces was not available for security reasons.) The gains in civilian population were not evenly distributed throughout the country. As in earlier years, the west had the largest annual rate of growth among the major regions. Several states outside the west also had high rates of increase, while losses were indicated for seven states. In consideration of possible errors in the estimates, changes of population within 1 or 2 or three percentage points, plus or minus, as shown in Table II, should be regarded as indicating little or no change.

Population Projections.—Revised projections of the U.S. population, based on various assumed fertility rates, were published by the census bureau late in 1955 for five-year intervals from 1960 to 1975. The projected figures for 1960 were in a range of 176,500,000 to 179,400,000; for 1965, the range was from 186,300,000 to 193,300,000; for 1970, the range was from 196,400,000 to 209,400,000; for 1975, the range was from 206,000,000 to 228,500,000. In announcing the projections, the census bureau pointed out that the major uncertainty in projections of the future population was that relating to fertility. The pro-

jections for the population already born were based on expected mortality rates, while the projections for the groups yet to be born during the 1955-75 period varied according to assumed fertility rates. The projections also were based on the assumption that there would be no disastrous war, major economic depression, epidemic or other catastrophe.

Table II.—Estimates of the Civilian Population, for Continental United States, by Regions, Divisions and States, July 1, 1955*

Region, division and state	July 1, 1955	April 1, 1950	Increase (+) or decrease (—), April 1, 1950, to July 1, 1955	
			Amount	Per cent
Continental United States . . .	162,284,000	149,634,000	+12,650,000	+8.5
Regions				
Northeastern states . . .	42,393,000	39,344,000	+3,049,000	+7.8
North central states . . .	48,137,000	44,369,000	+3,768,000	+8.5

*Figures exclude persons in the armed forces stationed in each area. Each estimate has been independently rounded to the nearest thousand and from figures computed to the last digit; hence, the sums of parts shown may differ slightly from the totals shown. Percentages are based on unrounded numbers.

Population by Residence.—Almost all of the increase in the civilian population of the U.S. after April 1950 was in the population of 168 of the standard metropolitan areas of the country, according to figures from the census bureau's current population survey conducted in April 1955. Of the 11,800,000 increase in the civilian population over the five-year period,

11,500,000 were in the metropolitan areas. The civilian population in the metropolitan areas rose from 83,800,000 to 95,300,000, an increase of 13.7%. The civilian population in the territory outside the metropolitan areas increased from 65,800,000 to a little more than 66,200,000, up only $\frac{1}{2}$ of 1%. Within the metropolitan areas, the rate of growth in the outlying parts (27.8%) was seven times as rapid as in the central cities (3.8%). Growth in the outlying parts of the metropolitan areas was greatest in the territory classified as rural in 1950. The civilian population of this area increased by 5,100,000, or 46.5%, whereas the population living in urban territory outside the central cities rose by 4,500,000, or 19.1%. Undoubtedly, much of this formerly rural territory had been built up since 1950 and would qualify for inclusion as urban. In the territory outside the metropolitan areas, the urban population increased by 5.0% to 24,200,000. The rural population, on the other hand, declined by 1.9% to 41,900,000.

The total farm population in April 1955 was estimated at about 22,200,000, a decrease of nearly 3,000,000 from 1950 when an estimated 25,100,000 were living on farms.

Marital Status.—The number of married and widowed women continued to increase substantially between 1950 and

Table III.—Projections of U.S. Population to 1975

Year (July 1)	Series AA*	Series A†	Series B‡	Series C§
1960	179,400,000	177,800,000	177,800,000	176,500,000
1965	193,300,000	190,300,000	190,300,000	186,300,000
1970	209,400,000	204,600,000	203,000,000	196,400,000
1975	228,500,000	221,500,000	214,600,000	206,900,000

*Series AA projections assume continued growth to 1975 at the 1954–55 level of fertility. †Series A projections assume growth to 1975 at the 1950–53 level of fertility. ‡Series B projections assume that growth at the 1950–53 level of fertility continues to 1965, then declines to about the prewar level by 1975. §Series C projections assume that the 1950–53 level of fertility declines from 1953 to about the prewar level of fertility by 1975.

1955, but the number of single women remained about the same, according to the April 1955 current population survey. In the five years, the number of women 14 years old and over increased by 3,600,000, or approximately 700,000 per year. The increase among married women amounted to about 550,000 per year, and the increase among widows amounted to about 150,000 per year. Changes in the number of single women and divorced women were small. In April 1955 the number of women 14 years old and over was about 60,300,000, of whom about 40,300,000 were married, 7,600,000 were widows, 11,000,000 were single and 1,400,000 were divorced.

About 1,400,000 of the married women were separated from their husbands.

There were about 56,000,000 men 14 years old and over in the population covered by the survey, or about 1,700,000 more than in 1950. The number of single men declined by about 700,000 during the five years to about 13,500,000 in 1955. A very large decline of about 1,000,000 single men in the civilian age group 20 to 24 years old resulted not only from an expansion of the armed forces but also from an increase in the number of married and from the relatively small number of births in the early 1930s. The number of married men of all ages increased by 2,100,000 in five years, whereas the total number of civilian men increased by only 1,700,000. Of the 56,000,000 total for men 14 years old and over in 1955, 39,100,000 were married, 2,400,000 were widowers, 13,500,000 were single and about 1,000,000 were divorced.

Income of Individuals.—About 78,000,000 Americans, 14 years of age and over, had some income in 1954 and the average (median) income was \$2,300, about the same as in 1953, according to results of the April 1955 survey.

The average income of an estimated 50,000,000 men who had some income in 1954 was \$3,200. For the 28,000,000 women with some income, the average income figure was about \$1,200.

The average income of men, which had been rising steadily between 1945 and 1953, levelled off at \$3,200 in 1953 and 1954.

Their average income had risen about \$1,400, or 75% above the 1945 figure of \$1,800. The average income of women during the same period increased by about \$250, or 30% above a 1945 figure of \$900. One reason for the relatively smaller increase in the income of women was the fact that the effect of wage increases for women workers had been partially offset by an increase in the proportion of intermittent workers whose annual earnings tended to be low.

Between 1947 and 1954 most occupation groups experienced steadily rising levels of income. During this period, average income increased sharply for all employed men except farmers and farm labourers, whose incomes, on the average, fluctuated erratically from year to year. The greatest relative gains were made by men in one of the highest paid groups, the salaried managerial workers (\$3,700 to \$5,700) and by the most highly skilled "blue collar" group, the craftsmen (\$2,700 to \$4,300). Among women the largest relative gains in average income were recorded by the highest paid group, the professional workers (\$1,900 to \$3,000).

Income of Families.—Average (median) family income in the United States was estimated at \$4,200 in 1954. This figure was about the same as in 1953 but \$300 higher than in 1952. The increase since 1952 probably represented a significant gain in purchasing power for the average family, since prices rose only slightly during the same period.

Of the nation's 42,000,000 families, about 16,000,000, or two-fifths, received incomes of \$5,000 or more in 1954 while 8,000,000, or one-fifth, had incomes of less than \$2,000. The remaining 18,000,000 families were in the \$2,000-to-\$5,000 bracket.

The 7% gain in family income from 1952 largely reflected the continued rise in wage rates for workers in most major industries. The survey data indicated that the median wage of salary income rose between 7% and 8% from 1952 to 1954. During this period, average income from farm self-employment decreased substantially while receipts from other sources of income remained stable.

Civilian Labour Force.—The total civilian labour force, 14 years old and over, averaged about 65,500,000 during the first three quarters of 1955 with a peak of 67,700,000 in August. The total civilian labour force averaged about 64,500,000 in 1954 with a peak of about 65,500,000 in August.

In Aug. 1955 total civilian employment reached a record level of 65,500,000, according to the census bureau's "Monthly Report on the Labor Force." Through the first nine months of the year, civilian employment averaged about 62,700,000, as compared with a monthly average of 61,200,000 for the year 1954. In September civilian unemployment was estimated at 2,100,000, the lowest point since the fall of 1953. The monthly average unemployment was about 2,800,000 for the first nine months of 1955 as compared with a 3,200,000 monthly average for the year 1954.

Another peak established during 1955 was in the number of employed women and teen-age girls which in July reached 20,200,000, breaking over the 20,000,000 mark for the first time. The female employment total represented nearly 31% of the total number of all employed persons in July.

Number of Households.—There were an estimated 47,800,000 households in the United States in April 1955. This was an increase of 4,200,000, or about 850,000 a year, from 1950. In 1955 there were about 42,200,000 urban and rural nonfarm households and 5,500,000 farm households as compared with 37,300,000 nonfarm and 6,300,000 farm households five years earlier. Thus the increase for the five-year period was entirely in nonfarm areas. Farm households in the United States have been decreasing in number at an average annual rate of about

50,000 during the five years 1950-55. Nonfarm households had been increasing at a rate of about 1,000,000 yearly during the same period. The number of married couples living doubled up households with others reached a postwar low of about 1,300,000, while in 1950 about 2,000,000 and in 1947 about 2,900,000 did not maintain their own households. A survey covering the second quarter of 1955 indicated that available vacant dwelling units amounted to about 2.3% of the nation's housing compared with a rate of 1.6% in 1950.

Enrolment in Schools.—Enrolment in school at the beginning of the 1954-55 school year was a record high of 36,100,000. Elementary school enrolment (first 8 grades) was 24,400,000, high school enrolment (grades 9 to 12) was 7,700,000 and college enrolment was 2,400,000. In addition, about 1,500,000 children were enrolled in kindergarten. About 30,000,000 persons were enrolled in public schools below the college level and 1,000,000 were enrolled in private schools, including parochial schools. Growth in private elementary and high school enrolment had taken place twice as fast, percentage-wise, as in similar levels of public schools since 1948, the first year for which such census data were available. During these six years the number of public school pupils increased by 4,800,000, or 20%, whereas the number of private school pupils increased by 1,200,000, or 9%. About 856,000 persons 14 to 34 years old were enrolled in special schools, providing instruction in trade or business, outside the regular school system.

Commerce and Industry.—The growth of the manufacturing industries in the United States after World War II is shown in a comparison of statistics from the *Annual Survey of Manufactures* for 1953 with data published in the 1947 *Census of Manufactures*. Total manufacturing employment during the period rose from 14,300,000 in 1947 to 17,100,000 in 1953. Value added by manufacture rose from \$74,400,000,000 to \$121,700,000,000.

A census of manufactures was conducted during 1955, covering operations of factories in 1954, and tabulation of the results was begun in November with publication of final results scheduled for completion by midsummer of 1956.

Census of Agriculture.—By Nov. 1955 the census bureau had published preliminary data of the 1954 *Census of Agriculture* for 33 states and about 2,000 counties. U.S. summary data had not yet become available. However, indications were that the census would show a decrease of about 8% to 10% during the five years 1950-55 in the total number of farms. Part of this decrease resulted from the consolidation of acreage into larger farms. Part of the change arose from the fact that the operators of hundreds of thousands of small marginal farms had found full or part-time jobs in industry that enabled them to get a better living, and their small farmsteads had become rural homes.

Moreover, suburban residential developments had diverted land away from agriculture.

Census Improvements.—During the year, the census bureau installed its second electronic data computing system (UNIVAC) to supplement the capacity of the first such system which was specially built for census work and had been in operation for several years. Speedier publication of the results of current surveys based on sample data had been made possible by use of this equipment and addition of the second system was made to expedite the publication of data collected in the full-scale censuses. Preparations also were under way in the fall of 1955 for the expansion of the sample used in the current population survey which collects the data on which the census bureau bases its monthly estimates of employment and unemployment, as well as other items of information about the population. Ceramics. The year 1955 was significant with regard to ceramics and ceramic products. There was a more general appreciation of what ceramics encompasses, as well as an increased appreciation of the importance of ceramic developments to progress in the fields of electronics, rockets, jet engines and nuclear engines. There was more interest in and emphasis on ceramic education, ceramic research and ceramic developments. Curriculums were strengthened, numerous ceramic research laboratories were established, and many capable scientific minds were attracted to the field.

During the year, volume output and value of ceramic products throughout the world increased appreciably. These products included abrasives, cements, enamels, structural clay products, sewer pipe, refractories and white wares (sanitary ware, electrical porcelain, table ware, wall tile, floor tile and dielectrics). Competition for markets throughout the world increased, and greater impetus was given to the manufacture of ceramic products in many European, middle east, and far east countries.

Increased production of ceramics was closely allied with reconstruction programs, new building programs, road-building programs, increased population and the increase in metal production. Special developments in the field were brought about by the demands of the electronic industry, the communications and transportation industries, defense programs and atomic energy developments.

Every segment of the industry was concerned with a greater use of automatic equipment, lower production costs, the application of quality control, the improvement of quality of product and more satisfactory packaging. Improvements were made in mixing, tempering, shaping, drying and firing, with attendant step-ups in production and a lowering of costs. Although great strides were made in practically every phase of production, particular note should be made of advances in the areas of plastic pressing, injection moulding, hot pressing, dimension control and the use of electricity in melting and firing.

There was a greater than usual search for workable deposits of unique raw materials as well as for deposits of standard raw materials. Associated with this search was an ever increasing interest in the areas of beneficiation and mineral conservation. These programs, together with associated technological studies, resulted in the reconsideration of product composition and mineral utilization. Concentrated attention was given to compounds of beryllium, columbium, hafnium, lanthanum, lithium, molybdenum, neodymium, tantalum and titanium as well as to the carbides, graphite, silicides and phosphors.

A great deal of progress was made in the area of single crystal development and in the use of chemically pure compounds in body compositions. Greater attention was given to the importance of solid state chemistry and solid state physics, and significant contributions were made to the understanding of reactions involved in heating mixtures of fine powders.

The industry produced new refractories for use at temperatures above 2,000° C., refractories for use in contact with special molten metals (including titanium), specific high-temperature resistors, ceramic rectifiers, ceramic semiconductors, ceramic cutting tools, refractory coating for metals, ceramic coatings for concrete blocks and piezoelectric products.

Important developments took place in the area of lightweight products, blocks for airfield runways, prestressed ceramics, thermal-shock resistant ceramic products, cooking ware, the efflorescence of building products, larger and thinner glazed tile, improved sewer pipe joining materials, unique building blocks and facings and insulation products.

The year saw increasing use of coloured ceramic products, the application of tile to exterior walls, the acceptance of mastic for tile setting, the use of a shorter kiln in the cement industry, the proving up of aluminum enamels, concentrated studies on the properties of brittle materials, and greater advances in products made of metals and ceramics (cermets). (J. F. McM.)

Cereals: see BARLEY; CORN; OATS; RICE; RYE; WHEAT.

Ceylon. A realm of the Commonwealth of Nations, Ceylon occupies an island southeast of the most southerly point of India. Area: 25,332 sq.mi. Pop.: (1946 census) 6,657,339; (1953 census revised) 8,098,637, including 5,621,332 Sinhalese, 908,705 Ceylon Tamils, 468,146 Ceylon Moors and 984,327 Indians (mostly Tamils). Language: Sinhalese 69%, Tamil 21%. Religion: Buddhist 61%, Hindu 22%, Moslem 9%, Christian (mainly Roman Catholic) 7%. Chief towns (pop., 1953 census): Colombo (cap.) 423,481; Jaffna 77,218; Dehiwala-Mt. Lavinia 80,086; Moratuwa 58,160; Kandy 57,359; Galle 55,874; Kotte 53,862. Queen, Elizabeth II; governor general in 1954, Sir Oliver Goonetilleke; prime minister, Sir John Kotelawala.

History.—The more prominent role in Asian affairs which Ceylon had begun to play two years before was continued during 1955. This was emphasized at the Asian-African conference (q.v.) at Bandung, Java, in April. Sir John Kotelawala, the prime minister, spoke out against the threat of communist expansion, and returned to Colombo with enhanced prestige. In January and February the prime minister attended the meetings of commonwealth prime ministers in London and paid brief official visits to the capitals of Egypt, Italy, France, the Republic of Ireland, the Netherlands and western Germany. In November he visited Australia.

Civil defense plans for immediate introduction in case of emergency were completed during the year. A foreign issue of importance was that of Ceylon's admission to United Nations membership, vetoed hitherto by the U.S.S.R.

Friction with India over the status of Indians in Ceylon continued and repeated discussions took place over points in the 1954 agreement which remained in dispute between the two countries. At the end of the year agreement still appeared as far off as ever.

During the budget debate in July the prime minister claimed that Ceylon was in a better financial position than at any time during the last 25 years. The public debt, which stood at Rs. 933,000,000 at the end of Sept. 1953, had been reduced to Rs. 905,000,000 and the amount of Rs. 184,000,000 which the government then owed in treasury bills had come down to Rs. 65,000,000. The revenue for 1954-55 reached a record figure of nearly Rs. 1,200,000,000 and a development loan of Rs. 75,000,000, floated in Colombo in March, was fully subscribed.

Under these favourable auspices, and with the world prices of Ceylon's three main export commodities—tea, rubber and coconut products—remaining at remunerative levels, the Ceylon government announced its second six-year development plan. The plan was based on a total expenditure of Rs. 2,529,000,000 of which 77% would be devoted to economic projects, 16% to social services and 3½% to defense and administration.

Trade expansion was pursued and a Ceylon delegation led by S. C. Shirley Corea, minister of commerce, visited 17 European countries to seek new markets for Ceylon goods. As a result,

trade agreements were negotiated with Italy, France, Czechoslovakia and Spain. Corea later visited Peking for the renewal of the rice-rubber agreement, on terms favourable to Ceylon. Trade relations with Japan were made closer by the visits of Japanese industrial advisers and rice experts and by the introduction into Ceylon of Japanese textile looms and technical equipment for a joint fishing venture.

In response to public pressure the government agreed that Sinhalese and Tamil should become the official languages of Ceylon in place of English in 1957. As a result, extensive changes in school curriculums were planned.

To mark Buddha Jayanti, the 2,500th year of Buddhism, the foundation stone was laid for an extension to the Temple of the Tooth at Kandy. A total eclipse of the sun on June 20 drew teams of scientists from all over the world but observation was impeded by clouds. (Jo. Hn.)

Education.—(May 1954) Aided schools: English, primary 21, pupils 13,182, teachers 546; English secondary (including junior) 580, pupils 265,271, teachers 10,463; collegiate 49, pupils 30,509, teachers 1,371; Sinhalese and Tamil (day and estate schools) 5,971, pupils 1,285,221, teachers 35,020; pirivenas (centres of oriental learning) 147, pupils 5,561, teachers 593. Unaided schools 87, pupils 19,311, teachers 91. Vocational schools and colleges (including fine arts) 8. Teachers' training schools (Sinhalese and Tamil) 18, students 2,790, teachers 200; English teachers' training college, students 96, teachers 22. One university with 2,000 students and 253 teaching staff.

Finance and Banking.—Monetary unit: rupee, with an exchange rate of Rs. 4.8 to the U.S. dollar. Budget estimates (1954, 1955 in parentheses) revenue Rs. 868,200,000 (Rs. 901,300,000); expenditure Rs. 900,600,000 (Rs. 934,700,000). Total public debt (Dec. 1954) Rs. 952,000,000, which Rs. 126,000,000 sterling loan. Currency circulation (Dec. 1954) Rs. 362,000,000, (Aug. 1955) Rs. 371,000,000. Bank deposits (Dec. 1954) Rs. 601,000,000, (Aug. 1955) Rs. 606,000,000. Gold and foreign exchange (Dec. 1954) 201,000,000 U.S. dollars, (Aug. 1955) 238,000,000 U.S. dollars.

Foreign Trade.—(1954) Imports Rs. 1,397,000,000, exports 1,809,000,000. Main sources of imports (1954): U.K. 21%; India 14%; other continental European Payments union countries 10%; Burma 9%; other sterling area 14%; U.S. and Canada 4%. Main destinations of exports: U.K. 29%; U.S. and Canada 11%; India, Burma 25%; other continental E.P.U. countries 7%. Main exports: tea 62%; rubber 16%; coconut products 12%.

PREMIER OF CEYLON, Sir John Kotelawala (centre), kneeling before altar at the Knightsbridge, London, Buddhist temple during his visit to Britain in Nov. 1954

transport and Communications.—Roads (fit for motor traffic, 1955) 00 km. Motor vehicles in use (1953): cars 49,800, commercial vehicles 19,000. Railways (1955) 1,442 km.; passengers carried (1952–53) 41,940, freight carried (1954) 1,620,000,000 metric tons. Air transport (1953): 1,468,000 km. flown; passenger-km. 20,089,000, freight 000 ton-km.; (1954): 1,620,000,000 passenger-km., freight 144,000,000 ton-km. Telephones (Jan. 1954) 22,855. Licensed radio receivers 53): 77,000.

Agriculture.—Main crops (metric tons, 1953; 1954 in parenthesis): tea 19,000 (166,300); rice 572,000; millet 22,000; copra 236,800; coconut 237,000; rubber 100,200 (94,000); cocoa beans (exports) 2,800; sweet potatoes and yams (1952) 50,000; cassava (1952) 223,000. Livestock (Sept. 1954): cattle 1,276,000; sheep 94,000; pigs (1953) 170; buffaloes (1953) 655,558; goats (1953) 498,977. Industry.—Manufactured gas (1954): 8,280,000 cu.m. Electricity 163,000 kw.hr. Production (metric tons, 1953): cement 65,900; salt 100. Graphite: value of output (1952) Rs. 7,500,000.

Chemistry. By the beginning of 1955, the chemical industry stood fourth among all manufacturing industries in the United States. Claiming more than \$15,000,000,000 in total assets, it was outranked only by petroleum and coal, primary metals, and food and beverages. Sales of chemical and allied products during 1954, totalling \$20,400,000,000, ranked fourth (after food and beverages, petroleum and coal, motor vehicles and parts and nonelectrical machinery). Sales were expected to reach \$22,000,000,000 or more in 1955—double the 1945 level.

Expiration of the excess-profits tax after 1953 and accelerated depreciation of defense-supporting facilities permitted earnings to rise at a faster rate than sales. A typical cross section of chemical firms, for example, showed an average 17% gain in sales during the first half of 1955 over the corresponding period of 1954, while net earnings rose an average of 31%.

But retained earnings together with depreciation reserves are not enough to pay for new facilities. In 1955, for the fourth successive year, capital expenditures exceeded \$1,000,000,000, and perhaps a third or more of the money was obtained from new financing.

Mergers.—The year was marked by a number of mergers, continuing a trend that makes it more difficult year by year to determine with any degree of precision which firms are indeed chemical firms. The drive toward diversification had caused many nonchemical corporations to acquire chemical companies. Examples in 1955: Borden Co. (food) acquired American Monomer Corp. and Monomer Polymer, Inc.; Merritt-Chapman & Pratt (construction) acquired Tennessee Products and Chemical Corp.; Monsanto Chemical Co. acquired Lion Oil Co. (petroleum).

Foreign Trade.—Meanwhile, trends were evident in the U.S. foreign chemical trade. Chemical exports in 1954 totalled about \$1,000,000,000, almost 25% above the 1953 total, while imports fell to \$245,000,000, or about 15% below those of the previous year. Preliminary figures for 1955 indicated, however, that the trend may have halted, that exports may have levelled off as imports turned up.

Foreign Resurgence.—The reasons for a narrowing trade gap are not hard to find. The German industry, traditional rival of the U.S. industry, had climbed into third place (behind the U.S. and Great Britain) as a chemical exporter, with about 12% of the world's total chemical exports. Having garnered about as much European business as they could, German industrialists are driving for markets in the underindustrialized nations of

South America, Africa and Asia.

The Japanese industry, too, built up since World War II, had become a factor to reckon with in world trade. Its chemical exports to Argentina and Brazil, for example, while still small, \$2,300,000 and \$3,700,000, respectively, were 230% and 570% above 1953 totals.

In Great Britain, as in the U.S., chemical growth had outpaced manufacturing in general. The output had increased about 65% over 1948, and was expected in 1955 to be 10% over the 1954 level.

Canada's industry, only one-twentieth the size of that in the United States, had nevertheless grown proportionally faster in recent years, and Canada was exporting 22% of its chemical production as compared with 5% for the U.S. There was reason to believe that Canada would become an increasingly important factor in world chemicals as further utilization was made of the Alberta oil and gas fields, of Canada's abundant salt, lime and coal reserves, its newly discovered potash deposits, and its low-cost hydroelectric power.

Less industrialized nations like India, Pakistan, Egypt and the Union of South Africa had started to manufacture their own chemical products, and would therefore buy less from the U.S. and Europe.

Research.—Research spending by the United States chemical industry had risen about 10% a year each year since 1952, and in 1955 totalled about \$300,000,000. During the year about \$38,000,000 of new research facilities were planned or were under construction.

A result of this emphasis on research was that about 20% of the 1955 chemical output was of products introduced since 1939. More than 80% of the agricultural chemicals trade, for example, was in products that were not commercially available 10 years before, and 90% of the drug prescriptions were for drugs that did not exist 15 years earlier.

Estimated Growth of the Chemical Industry, U.S.

Products	1953 sales volume	1935–50 growth (% per year)	1952–60 growth (% per year)
Plastics and resins	\$1,410,000,000	15	14.5
Man-made fibres	1,195,000,000	12	9
Fertilizers	1,096,000,000	9	5
Synthetic rubber	529,000,000	*	6.5
Medicinals	409,000,000	19	12.5
Antiknock agents	250,000,000	13	9.5
Dyes	168,000,000	3	6
Surface-active agents	145,000,000	34	7.5
Agricultural pesticides	119,000,000	8	7.5

*Not available.

New Drugs.—Perhaps the two most dramatic health achievements during the year were the introduction of the Salk vaccine for poliomyelitis and the extension of the use of drugs for the mentally ill. The vaccine is a biological rather than a chemical development, but the drugs for the emotionally disturbed, the usefulness of which were discovered in 1954, are within the purview of the chemical industry.

The two most promising drugs were reserpine, an alkaloid extracted from an Indian plant, and chlorpromazine, a synthetic compound.

One advance of the year was the discovery (by Chas. Pfizer & Co. chemists) that reserpine could be extracted from a more readily available Central American shrub. Pfizer, S. B. Penick & Co., and Syntex, S.A., were believed to be making it from this source. Another advance was the isolation of other promising alkaloids from the mixture present in the plants. Rescinamine was isolated by Riker Laboratories; canescine, by Sandoz, Inc.; raunormine (possibly identical with canescine), by S. B. Penick; and deserpidine, by the Ciba Co.

Possibly more significant was the synthesis by Wm. S. Merrell Co. (division of Vick Chemical Co.) of α -(4-piperidyl) benzhydrol hydrochloride, trade-named Frenquel. In preliminary

trials the drug blocked hallucinations in 60% of schizophrenics and alcoholics, showed value in postsurgical confusion states, and appeared to be particularly effective in the early, acute stage of schizophrenia.

Since more than half the nation's hospital beds had been given over to mental patients, and since it cost more than \$1,000,000,000 of taxes to care for them for one year, developments in this field were of economic as well as scientific and humanitarian interest.

Another alkaloid advance was the synthesis by Eli Lilly & Co. of lysergic acid, an intermediate useful in the synthesis of ergot alkaloids. These, in turn, are used in the treatment of high blood pressure and migraine headache. Although the synthesis was difficult, it might well prove economic since the natural alkaloids were selling for \$60,000 per pound.

Several new antibiotics, clinically promising but still not commercialized, were unveiled during the year: anisomycin (Chas. Pfizer), active against fungi and protozoa but not bacteria; PA-105 (Pfizer), active against Gram-positive bacteria; celesticetin (Upjohn), against Gram-positive organisms and, to a limited extent, fungi; fungichromin and fungichromatin (Sharp & Dohme), against fungi; pleomycin (Sharp & Dohme), against Gram-positive and -negative bacteria, but irritating to tissue; spiramycin (Rhone-Poulenc, France), against Gram-positive organisms; etamycin (Bristol Laboratories), against tuberculosis bacillus; griseoviridin and viridogrisein (Parke, Davis), against broad-spectrum antibiotics with proved value in animals but no published data on human therapy; and puromycin (Lederle Laboratories), synthesized from D-xylose.

Cycloserine, an antibiotic developed by Commercial Solvents Corp. and also studied by Eli Lilly & Co., appeared to be a potent weapon against tuberculosis. It improved 36 out of 37 severely ill pulmonary tuberculosis patients in a New York hospital, but its toxicity (in four of the cases) might be a barrier to general use.

Hormone therapy for arthritis and numerous other diseases took forward strides. Schering Corp. synthesized metacortandracin and metacortandralone, which are three to five times more active against rheumatoid arthritis than cortisone and hydrocortisone, and they were made commercially available during the year. American Cyanamid Co. researchers determined the structure of ACTH (adrenocorticotrophic hormone), paving the way toward learning how ACTH, cortisone and similar hormones work and also toward synthesizing the biologically active portions thereof.

Aldosterone, the chief adrenal hormone, was totally synthesized by scientists of the Swiss firm Ciba Ltd. The 30-step method might prove to be the best way to obtain the compound, which is particularly useful in treating Addison's disease.

A cortisone derivative, 9- α -fluorohydrocortisone, appeared to be too toxic for use against rheumatoid arthritis, but extremely small doses were found effective against Addison's disease.

Potentially significant was the discovery at the University of Wisconsin of a compound named kinetin which causes mature cells to divide like young cells. Elucidation of the mechanism might permit the development of kinetin antagonists that would prevent cells from dividing. The significance of this, of course, is that cancers grow as a result of undisciplined division of body cells.

Agricultural Chemicals.—Systemic insecticides received a great deal of attention from the U.S. department of agriculture as well as from many industrial firms. These are materials that are taken up by plant or animal tissue, rendering the organism toxic to insect pests.

One of the latest products, O,O-diethyl S-ethyl mercaptomethyl dithiophosphate, gave cotton plants four to nine weeks'

protection against boll weevil, cotton leaf perforators, spider mites and cotton aphids. It was applied to the seeds as an adjuvant dust.

Other compounds were given orally or subcutaneously to cattle to evaluate their usefulness against cattle grubs, ticks and stable flies. Grubs are a particularly difficult problem since they live for months under the animal's hide, often escaping detection and ruining much of the meat and hide. Because of their high toxicity, these compounds were under close scrutiny by the U.S. department of agriculture and the Food and Drug administration. The latter agency would eventually have to set residue limits for crops or meat treated with these materials.

Nematodes are another kind of plant parasite, which cause more damage every year than insects. The U.S. department of agriculture estimated the annual toll at \$500,000. A nematocide introduced experimentally during the year by Stauffer Chemical Co. was Vapam, sodium N-methyldithiocarbamate dihydrate; it was expected to be commercially available before the next crop year. Other firms were readying other compounds for the market.

Ethyl Corp. evaluated a series of new agricultural fungicides. The products were *s*-triazine derivatives, of which the most effective member, 2,4-dichloro-6-(*o*-chloroanilino)-*s*-triazine, was well against early and late tomato blight, apple scab, celery early blight, muskmelon leaf spot, tomato anthracnose, potato late blight, dollar spot, turf diseases, onion foliar diseases and leaf diseases of ornamentals.

Plastics.—In polymer research, heretofore largely empirical, a trend was evident toward probing more deeply into fundamental molecular structure and using this new knowledge to design new polymers. Three paths were followed: (1) inserting definite chemical groups at specific places in the polymer chain; (2) attaching special branches to the chain; and (3) using energy (heat, radiation, etc.), chemical reagents and carefully controlled polymerization conditions to vary the spatial configuration of the chain.

Already resulting from this new, more scientific approach were a superior polystyrene (from Milan Polytechnic Institute, Italy), polyurethane rubber (Goodyear), heat-stable wire enamel (Westinghouse), fluoroacrylate rubber (Minnesota Mining & Mfg.) and a stronger and more heat-resistant polyethylene (from Institute for Coal Research, Germany).

This polyethylene, developed by Karl Ziegler, was one of many advances in making this fastest-growing plastic material. Phillips Chemical Co., by a different process, achieved a similar result, *i.e.*, a product that was more rigid, denser, softened at higher temperature, and had higher tensile strength and molecular weight than conventional polyethylenes. Also, General Electric brought on the market a new irradiated polyethylene designed for electrical insulation; incorporation of an oxidant inhibitor permits use of the film continuously at 125° C.

Polystyrene was faced with a potential competitor as Dow Chemical and American Cyanamid revealed test results with polymethylstyrene. The new plastic, somewhat costlier than the styrene product, appeared to be superior in resistance to impact and to high-temperature distortion, and to give better results in styrene-butadiene synthetic rubbers, latex and renated-alkyd paints.

Goodrich-Gulf researchers succeeded in making natural rubber synthetically, and late in the year the company decided to build a pilot plant in order that the synthetic "natural" rubber could be evaluated on a large scale.

The government-owned synthetic rubber facilities were sold during the year to private industry. Most of the plants were bought by the same firms that had operated them for the government.

Monsanto Chemical made a deal with Massachusetts Institute of Technology and published a booklet, *Plastics in Housing*, which presented a detailed analysis of each of the major plastics in terms of present and possible future applications in the construction industry. The aim of the plastics industry was to establish better communications with the construction industry, provide it with more engineering data, and endeavour to break down additional architectural constraints so that plastics might be more widely employed as structural materials.

Man-Made Fibres.—The year was marked by adaptation of existing man-made fibres to new uses rather than the development of new fibres. Union Carbide and Carbon's Dynel and du Pont's Orlon, for instance, began to find wide use in the manufacture of imitation

coats resembling sheared beaver, mouton and seal.

Two new fibres were Celanese Corp.'s Arnel, a cellulose triacetate that was said to excel conventional acetate rayon in resistance to heat, sunlight, saponification and wet stretching; and vinylon, an insolubilized polyvinyl alcohol fibre developed by Kurashiki Rayon Co. (Japan).

Industrial Products.—A host of new materials were designed to fill old and new needs in various segments of industry. American Cyanamid's AM-955, a mixture of acrylamide and N-methylene-bisacrylamide, for civil engineering applications, prevents moisture seepage in permeable soils. Possible uses were in dam construction, tunneling, oil well drilling and irrigation canals.

Stepan Chemical Co. introduced a new solvent, dimethyl, which had possible applications as an antifreeze, a paint remover, an ethylene solvent, in fibre spinning, in petrochemical and fatty acid purification, and as a reaction medium.

Westinghouse developed a series of silicone lubricants, as did General Electric, for use in jet aircraft as well as in industries requiring high temperatures—steel, glass, ceramics, etc. Southwest Research Institute, Victor Chemical Works, Monsanto, and Virac-Carolina Chemical were researching phosphate esters for similar applications; carboxylic diesters were being studied by Am & Haas, Emery Industries and the Texas Co.; and Monsanto was investigating silicate esters.

Consumer Products.—Few of the industry's products were sold directly by the general public, and fewer still were of noteworthy novelty. But there were some.

Antiseptic soaps now accounted for a fifth of all bars sold. Pampers-Palmolive during the year test-marketed a new Palmolive bar containing a bacteriostat.

Man-made fibres had gained popularity largely because they required little or no ironing. During 1955 textile mills were placing much emphasis on chemically treated cottons that had the same desirable characteristic. Among the leading chemical treatments were urea-formaldehyde resins (du Pont, Monsanto, Am & Haas) and melamine-formaldehyde resins (American Cyanamid), together with a water-repellent.

PLASTIC "BUBBLE," a stage in the manufacture of Saran Wrap, transparent household wrapping material developed by the Dow Chemical Co. The photograph was made at a production plant opened in 1955

Designed to give fluffier, easier-ironing laundry were cationic softeners which were added to the rinse water. Many smaller firms had marketed such products with limited success, but in 1955 two major firms introduced products—Corn Products Refining Co. and A. E. Staley Mfg. Co.

Aerosol-packed products—the familiar push-button cans—reached new record output in 1954: 185,000,000 units of \$190,000,000 retail value. The gain was 32% over 1953, and additional growth was indicated for 1955.

New Processes.—Of less immediate obvious significance was the development of new processes, which promised nevertheless to provide ultimately new or lower-cost products.

One of the more promising rocket fuels is dimethylhydrazine, and during the year four firms readied processes for making it—Olin Mathieson, Food Machinery & Chemical, Aerojet Engineering and Metaelectro Corp. The first three oxidize dimethylamine, each by a different method, but the latter oxidizes ammonia, urea or an alkylamine with a special oxidizing agent.

Itaconic acid is a potentially useful intermediate for a host of products, but it had been too expensive. Chas. Pfizer & Co. developed a fermentation process that promised a reasonable cost.

Zone melting, a technique wherein a moving molten zone of a material sweeps impurities along in its path, enabled General Electric to produce high-purity silicon for use in transistors, the small, simple devices that replace vacuum tubes in radios, television receivers, etc.

General Electric also captured newspaper headlines by making synthetic diamonds from carbon at extremely high pressures and temperatures. The real significance, however, was in the equipment, which could be used for potentially more promising research into the behaviour of materials under extreme heat and pressure conditions.

Utilization of hydrogen chloride as a chlorinating agent, in a process devised by Aaron Teller, held out hope for lower-cost chlorination—a step required in the manufacture of DDT,

paradichlorobenzene, and many other important commercial chemicals.

Ammonia is usually made from natural gas, but a plant being built in Alabama by Ketona Chemical Co. was to employ low-temperature fractionation—one of three possible methods—to obtain hydrogen from coke-oven gas.

A synthetic zeolite (a doubly hydrated silicate of aluminum and either calcium or sodium) was discovered by Linde Air Products to be a "molecular sieve," absorbing molecules of one size and letting larger ones go past. It can separate *n*-hexane from isohexane, *n*-heptane from methylcyclohexane, etc. Uses were foreseen in hydrocarbon fractionation, drying and purification of liquids, and many similar operations.

Titanium, "wonder metal" of the past few years, lost some of its luster. Military needs proved smaller than anticipated, and the government was re-examining subsidization of new plants. But if the short-term outlook was dubious, the long-range picture was still bright—brighter, in fact, as a result of newly developed processes: electrolytic titanium processes, in the research stage at a number of company laboratories; a new, direct fluid-bed process developed by du Pont to make titanium tetrachloride (which in the Kroll method is reduced with magnesium to produce titanium metal); and a new process developed by U.S. Industrial Chemicals Division of National Distillers Corp. to make high-purity sodium (used alternatively instead of magnesium to reduce the tetrachloride).

Experts predicted that titanium output, now only about 10,000 tons a year, might eventually reach 1,000,000 tons.

Nuclear Chemistry.—The most exciting area of chemical process operation during the year was nuclear chemistry. From the refining of uranium ore to the utilization of radiation and fission by-products, the chemical industry was intimately concerned with nuclear science.

Several firms—chemical as well as others—banded together to form Industrial Reactor Laboratories, which would carry out research for the member companies. Meanwhile, Upjohn Co. was already using a Van de Graaff electron accelerator for production-line sterilization of pharmaceutical products. Atlantic Refining Co. used a 1,000,000-electron-volt resonance transformer to accelerate electrons and throw them at petroleum fractions to "crack" them into high-octane components. This was still a research project.

A score of chemical firms were investigating radiation catalysis; *i.e.*, the use of radiation (from radioisotopes, fission products or particle accelerators) to promote and influence the course of such chemical reactions as polymerization, halogenation, oxidation, nitration, cyclization, etc. Russian scientists obtained high yields of phenol, for example, by a radiation-induced reaction of benzene with water; and Rumanian chemists reported a high yield of the desirable isomer of benzene hexachloride by chlorination of benzene in the presence of gamma radiation.

Many chemical firms were also interested in process heat from high-temperature nuclear reactors. It was estimated, for example, that use of atomic heat could slash 9 cents from the 15-20-cent cost per 1,000 cu.ft. of synthesis gas manufacture. (Synthesis gas is a mixture of carbon monoxide and hydrogen derived from coal and steam.)

Most intriguing, of course, was the imminent development of economical nuclear power, for that would extend manyfold the use of nuclear fission. And that, in turn, would intensify the challenge to the chemical processing industry of winning uranium (and perhaps thorium) from its ores, separating and purifying the isotopes, operating the reactors under optimum conditions and utilizing to the fullest efficiency the fission products, heat and radiation therefrom. This was probably the

greatest challenge of the ensuing decade. (See also BIOCHEMISTRY; CHEMOTHERAPY; FOREIGN INVESTMENTS; PHYSIOLOGICAL CHEMISTRY; PLASTICS; VITAMINS AND NUTRITION.) (H. C. E. J.)

Chemotherapy. The year 1955 saw continued interest in the development of antibiotic substances from the higher plants. It also witnessed the development of synthetic drugs useful in the treatment of mental disease.

Allium Oils.—Bulbs belonging to the allium (garlic) family yield oily substances with significant activity against the tubercle bacillus organism. An oil extracted from *Allium schoenoprasum* showed activity slightly less than that of an equal quantity of streptomycin. The oil of *Allium cepa* was but one-fifth as active as streptomycin.

Plant Extracts as Antiviral Compounds.—At the University of Texas (Austin) extracts obtained from 22 of 44 plants prolonged the life of chick embryos injected with one of the following viruses: vaccinia, influenza, meningopneumonitis and reovirus. These viruses had become egg-adapted strains by repeated inoculation into embryonated eggs through the yolk sac. Extracts from three plants, *Allium helleri*, *Ambrosia aptera* and Sensitive plant, successfully inhibited three of the four viruses.

Plant Extracts as Tumour Inhibitors.—The same workers reported that an extract of *Anemone decapetala* proved to be the most effective in inhibiting growth of a tumour cultured in the yolk sac. A relatively nontoxic extract of *Liatris punctata* was the most active inhibitor of tumour growth in mice and in tissue cultures.

Polylysine and Polyvinylamine.—Both of these basic polypeptides proved to be virus inhibitors in tests performed upon virus growths in the chick embryo. The viruses shown sensitive were influenza B virus and mumps virus. Polylysine was more effective compound and about one-fifth as toxic as polyvinylamine.

Mycostatin.—The antibiotic Mycostatin, known also as fungicidin, proved successful in the control of fungus diseases. It prevented death when inoculated into mice previously infected with *Coccidioides immitis*, *Sporotrichum schenckii* and *Cryptococcus neoformans*.

Fungichromatin and Fungichromin.—Fungichromatin and Fungichromin were isolated from a strain of *Streptomyces cellosae*. As their names indicate, these antibiotics are antifungal in character.

Spiramycin.—Spiramycin was isolated from a new species of molds, *Streptomyces ambofaciens*. Chemically and biologically it was found to be similar to the previously isolated antibiotics erythromycin and carbomycin. It has an antibiotic spectrum exhibiting activity chiefly against gram-positive bacteria.

Griseoviridin and Viridogrisein.—These antibiotics were recently isolated. They proved to have a broad spectrum against both gram-negative and gram-positive bacteria and rickettsiae. Tested in animals, the antibiotics were found to be tolerated well when applied locally or given orally or by injection in mice and dogs.

Pyrimidine Derivatives.—Three types of pyrimidine derivatives were shown to inhibit the growth of disease-causing bacteria in the test tube, but required testing in animals before use in human disease could be contemplated. They included 2,4-diamino-pyrimidine, aminoanthrapyrimidines and 5-phenylthiouracils. A fourth type, the tetrahydropyrimidines, showed ability to restrict the growth of fungi.

Oxamycin—Cycloserine, PA94.—This new antibiotic was isolated from a new species of actinomycetes, *Streptomyces garyphalus*. Its chemical structure was established as D-4-amino-3 isoxazolidone, a zwitter ionic, crystalline substance of

molecular weight. Oxamycin was demonstrated to be highly diffusible and to have a broad antibacterial spectrum. When tested experimentally induced bacterial infections of animals it proved capable of controlling gram-negative and gram-positive bacterial infections and rickettsial diseases. It did not show significant antituberculosis effect in mice. Apparently the antibiotic was more effective in living animals against infectious bacteria than was indicated by test tube experience, and despite the experience in mice it showed considerable promise in tests against tuberculosis infections of human beings.

Coliformin.—This new antibiotic was isolated from *Escherichia coli*, a common organism found in the human lower intestinal tract. Coliformin was found to be exclusively active against fungi causing plant, textile and leather damage as well as types causing animal and human disease. The human fungi which were found sensitive to the antibiotic included *Candida albicans*, *Candida krusei*, *Candida tropicalis*, *Hormodendrum pedrosoi*, *Microsporium gypseum*, *Sporotrichum schenckii*, *Torulopsis neoformans*, *Trichophyton mentagrophytes* and *Trichophyton tonsurans*.

Biallylamicol (Camoform).—Although synthesized several years earlier, Biallylamicol was demonstrated in 1955 to have amoebic properties. Chemically the substance was shown to have the formula 6,6'-diallyl- α,α' -bis(diethylamino)-4,4'-bi-*o*-resol, dihydrochloride. When the drug was given to animals experimentally infected with *Endamoeba histolytica*, the causative organism of human amoebiasis, it demonstrated slight effect against acute amoebiasis of rats, moderate effect against amoebic enteritis in dogs and good effect against liver amoebiasis of msters.

Gallic Acid.—In tests upon monkeys, aged gallic acid was found to protect all monkeys after experimental inoculation with poliomyelitis (type I) virus. Freshly prepared acid failed to demonstrate similar protective powers. The protective substance was believed to be a polymer or an oxidative product of gallic acid produced by aging. Experimental work was proceeding in an attempt to isolate the active principle.

Ataractic Agents.—This term had come to be applied to a new class of drugs developed during the previous two years. This group of therapeutic agents favourably altered the state of patients suffering from various forms of agitated, excited and hallucinatory mental disease. The term ataraxia was derived from the Greek, and it means freedom from confusion, peace of mind. The term was suggested by Alister Cameron, a classicist of Cincinnati (O.) to Howard Fabing, a neurologist.

The use of these drugs enabled psychiatrists to release mental patients considerably earlier than formerly and reduced the nursing and domiciliary care problems in mental institutions. Patients were made calmer, more amenable to psychiatric approach, ate better and were better able to attend to their personal needs as a result of treatment.

Agents of this type introduced into medicine during the year included Frenquel, alpha-(4-piperidyl)diphenyl carbinol hydrochloride, which is chiefly an antihallucinatory agent. It also demonstrated effectiveness in blocking the action of experimentally induced psychoses in normal persons caused by use of hallucinatory agents such as lysergic acid diethylamide (LSD), mephedrine and mescaline. Meproamate, known as Miltown and guanil, also was introduced for use in this field. It proved to be useful chiefly in the relief of anxiety syndromes and tension states, tension headaches and in the treatment of alcoholism. It was shown to have a structure similar to a muscle relaxant, mephedrine; chemically it was shown to have the formula, 2-ethyl-2-n-propyl-1,3-propanediol dicarbamate. (See also ALERGY; BACTERIOLOGY; CANCER; PSYCHIATRY; VITAMINS AND NUTRITION.)

Cherries: see FRUIT.

Chess. Nicholas Rossolimo of Paris, Fr., was named winner of the United States open championship after tying with Samuel Reshevsky of Spring Valley, N.Y., in the 1955 tournament at Long Beach, Calif., in August. Each finished the competition with a record of 10-2, but the tourney committee declared Rossolimo the victor on points, 62½-61½. The points consisted of a median of the sums of their opponents' scores. Both Reshevsky and Rossolimo were undefeated, their minus points coming from four draws each.

Gisela Kahn Gresser, New York city, and Nancy Roos, Los Angeles, Calif., finished in a tie in the U.S. women's tournament ended Sept. 5, at the Marshall Chess club in New York city. Each tallied 9-2 and the two were named co-holders of the title for 1955.

Clinton Parmalee of Newark, N.J., took top honours in the national amateur championship May 22, at Lake Mohegan, N.Y. He had a tally of 5½-½. A cup was awarded to Kathryn Slater, New York, for leading the women players. Awards for best scores also went to Victor Guala, New York, in Class A and Eugene Salome, New York, in Class B.

Among the features of 1955 was the interzone tournament that brought together many of the world's leading players at Göteborg, Swed., in September. As a result of the event, nine players qualified to compete in the challengers' tourney leading to the world championship in 1956. Five soviet stars, headed by David Bronstein who scored 15-5, were among those selected. Others chosen were Paul Keres, 13½-6½; Efim Geller, 12-8; Tigran Petrosian, 12½-7½; Boris Spassky, 11-9; Oscar Panno of Argentina, 13-7; Laszlo Szabo of Hungary, 12-8; H. Filip of Czechoslovakia, 11-9, and Herman Pilnik of Argentina, 11-9. Another master, Vassily Smyslov of Moscow, who was seeded, also was scheduled to compete in the tourney to determine a challenger for the crown held by Mikhail Botvinnik of Leningrad.

Spassky won the world junior title competition ending Aug. 8, at Antwerp, Belg., with Edmar Mednis (New York state champion of 1955) of the Marshall Chess club finishing as runner-up. Masters from seven countries took part in the annual congress at Hastings, Eng., early in the year with two soviet representatives sharing premier group laurels. Smyslov and Keres each scored 7-2, Smyslov having 5 triumphs and 4 draws while Keres won 6, drew 2 and lost one. Among the premier reserves, Istvan Bilek of Hungary was top man with a count of 7-2. Boris Ivkov of Yugoslavia, with 13-4, triumphed in the jubilee tourney at Buenos Aires, Arg., in May.

A team of U.S. masters visited Moscow in July for a series of matches with a Soviet union team and bowed, 25-7. However, the trip had a bright side for U.S. chess followers as the world champion, Mikhail Botvinnik, was defeated by Samuel Reshevsky, leading player of the U.S. (T. V. H.)

Chiang Kai-shek (1887-), president of the Republic of China with its capital in Taipei, Formosa, who had been, during three decades in a period of China's changing history, hailed first as conqueror of the Chinese warlords and symbol of the national revolution and resistance against Japanese aggression, and then driven out of the mainland and regarded as the arch enemy of the Central People's Republic—remained during 1955 the generally accepted Chinese Nationalist leader in fighting communism and a target of attack by those who wrote off the cause of the Chinese Nationalists. Chiang's position became increasingly difficult as the communists' campaign of peaceful co-existence won wider response and support. Nevertheless he looked to international

(P. L. W.)

"—AND MY POP CAN LICK YOUR POP," a cartoon of 1955 by Haynie of the *Greensboro Daily News* (N.C.)

action to prevent communist expansion and repeatedly warned the west to beware of the pitfalls of the communist peaceful gestures. While the fighting along the offshore islands opposite the mainland was intensified and the Chinese-American mutual defense treaty was about to be concluded, Chiang stated on Nov. 23, 1954, that the Chinese Communists would not try to invade the Nationalist held islands if the U.S. announced its participation in the joint defense of these islands. He also advocated extending the southeast Asia defense system to include Nationalist China, South Korea and Japan. In a message to Secretary of State John Foster Dulles in connection with the signing of the Sino-American defense treaty on Dec. 2, 1954, Chiang also called it "a necessary link in the Far Eastern defense." The interpretation and ratification of the treaty by the U.S. senate and the United States' position relative to the defense of Quemoy and Matsu Islands in the light of the communist threat brought a number of distinguished Americans including Secretary of State Dulles, Army Secretary Robert T. Stevens, and Adm. Arthur W. Radford to Formosa to consult with Chiang during 1955. Prior to the Geneva conference of the heads of the Big Four Powers Chiang declared again on July 17 that his government and people would never agree to any cease-fire arrangement with the Chinese Communists, nor relinquish the sacred duty of recovering the mainland and liberating the Chinese people from communist tyranny. (H. T. CH.)

Chicago.

Second largest U.S. city, a port of entry and the county seat of Cook county, Ill., Chicago lies at the southwest corner of Lake Michigan. Its population in the 1950 census was 3,620,962, and for the six-county Chicago metropolitan area 5,495,364. It was estimated that the 1955 population was 3,876,000 in the city and 6,185,000 in the metropolitan area. The mayor, elected in 1955, was Richard J. Daley.

Employment in 1955 rose from the slump of 1954 by about

80,000 persons, and unemployment decreased by a nearly equal amount over the same period. Bank clearings in Chicago for the first nine months of 1955 increased 9.3% to \$39,091,674,000 from \$35,752,873,000 in the same period of 1954. New investment in industrial plants in the Chicago metropolitan area for the first nine months of 1955 amounted to \$258,970,000, an increase of 41% over the same period of 1954. The dollar volume of industrial production in 1955 was expected to exceed \$19,000,000,000, an all-time record, compared with a production volume of \$17,000,000,000 in 1954. Retail sales in 1954 were estimated at \$7,400,000,000 for the Chicago metropolitan area, approximately 6% more than in 1954.

Steel production in the Chicago metropolitan area in the first nine months of 1955 broke all previous records with 16,046,000 tons of steel produced. It was estimated that production would approximate 21,000,000 tons for 1955, as against the record of 20,628,100 tons produced in the record year of 1953.

O'Hare field, Chicago International airport, opened for commercial aviation late in the year, is the world's largest commercial airport, encompassing approximately 6,500 ac. of land. The total number of passengers carried by the Chicago Transit authority in the first eight months of 1955 was 412,820,225, a decline of 3.4% from the 427,217,493 carried in the first eight months of 1954.

All types of construction contracts awarded in the first eight months of 1955 increased spectacularly to \$882,449,000, from \$487,808,000 in the first eight months of 1954, an increase of 81%.

School enrolment in Chicago in the fall of 1955 amounted to approximately 315,000 public and 240,000 parochial elementary pupils, plus 91,000 public and 48,000 parochial high school students. The total public assistance expenditures in Cook county for the first eight months of 1955 approximated \$56,861,837, an increase of 15.8% over the same period of 1954. A monthly average of 149,796 persons were receiving relief during the first eight months of 1955, which compared with 131,581 persons in 1954. The average monthly allowance per person obtaining some form of assistance in Cook county was \$47.45 in this period of 1955, which may be compared with the \$46.73 average for the same period of 1954.

The 1954 total appropriations for current operations of the six governments that cover Chicago in whole or in part were: city of Chicago, \$475,725,000; Cook county, \$101,208,000; Cook county forest preserve district, \$6,358,000; Chicago board of education, \$181,853,000; Chicago sanitary district, \$45,097,000; and Chicago park district, \$48,695,000.

The total 1954 property tax rate (tax paid in 1955) for the combined six taxing authorities in the city of Chicago was \$3.768 per \$100 of assessed valuation for all of the city north of 87th street. The rate for the city south of 87th street was \$3.792, which includes the southern Cook county mosquito abatement district. Total assessed real property valuation for 1954 taxes was \$8,703,599,431 within the city limits.

Total bonded debt, applicable to the city of Chicago, for the general obligations of these same six governments, as of Jan. 1, 1955, amounted to \$403,769,073. In addition, these same six governments had \$184,665,000 in revenue bonds outstanding as of Jan. 1, 1955.

The 42-story Prudential Insurance Company building was completed late in the year. A new Inland Steel building, a 19-story structure, was started, as was a 14-story building for the America Fore Insurance group.

Notable among public works projects under way was the authorization of \$246,000,000 to accelerate the construction of the expressway system radiating from the central business district to outlying areas, and the construction of the last nine city

FLAMES POURING THROUGH WINDOWS in Barton hotel fire Feb. 12, 1955, in Chicago. Twenty-nine persons died

built public garages. Passage of enabling legislation by the state permitted completion of plans for construction of a \$30,000,000 lake-front convention hall. The legislation was also enacted for preliminary studies on the \$288,000,000 Fort Dearborn project, which was to be erected in an area north of the main Chicago river, replacing obsolete property with apartments, offices, governmental buildings and recreational plazas.

The Calumet-Sag channel project received an appropriation of \$4,000,000 from the federal congress, and work was started on the widening of the western three miles of the channel. This project, coupled with the development of a deepwater port in Lake Calumet and the St. Lawrence seaway project, was expected to revitalize Chicago's position in inland waterway shipping.

(L. LN.)

Child Labour. **United States.**—Employment among youth 14 through 17 years of age continued downward in the year ended June 1955, dropping to 2,100,000—nearly 150,000 below 1954. This decrease was entirely the result of the decline in the employment of out-of-school youth, especially those 16 and 17 years old. Figures compiled by the U.S. bureau of the census showed that nearly 1,000,000 boys and girls 16 and 17 years of age were out of school in 1954 and only half of them had jobs.

The increasing lack of employment opportunities for young people who had dropped out of school before completing high school was causing particular concern among education officials and others connected with the welfare of youth. The special problems of those dropouts led to the holding of hearings on youth employment by the U.S. senate committee on juvenile delinquency and to recommendations for improving the situation.

Progress was made in reducing child labour in agriculture and narrowing the gap in schooling between rural and urban children. Between 1951 and 1954 enrolment of children 10 through 15 years of age in rural farm areas rose from 94% to 97% while in urban areas the school enrolment figure of 99% remained the same. This gain for rural youth followed the strengthening of the child-labour provisions of the Fair Labor Standards act in 1950, prohibiting the employment of children under 16 years of

age in agriculture during school hours.

About one-third of the states amended their child-labour or school-attendance laws in 1955. Improvements included strengthening hazardous occupations provisions in Ohio, Maine, Nebraska and Tennessee. New York set a maximum 40-hr. week for minors under 16, instead of its former 44-hr. week. California provided that employment certificates could be revoked for minors of 16 and 17, as well as for those under 16, if the health or education of the minor was jeopardized. A minimum-wage provision was passed in Delaware for minors under 16; it set 75 cents an hour (60 cents if the children are attending school), but permitted a lower wage if the parent consented in writing. Illinois increased its minimum-school term, while South Dakota and Montana tightened the exemptions under which children under 16 may leave school to go to work.

On the other hand, a number of states lowered their child-labour or school-attendance standards. In Utah the basic minimum age for work in factories at any time or in most employments during school hours was reduced from 16 to 14, and the minimum age for work outside school hours in agriculture or as caddies or newsboys was lowered to 10. The night-work provisions were relaxed in Oklahoma for minors 15 and over employed in theatres, and in Delaware for minors under 16 in street trades. In Delaware also the night-work prohibition for girls 16 and over was repealed. The South Carolina school-attendance law was repealed.

New York and Massachusetts each extended for one year their acts authorizing relaxation of certain labour laws for minors 16 and over during emergencies.

Other Countries.—No conventions or recommendations dealing specifically with young workers were considered at the 1955 International Labour conference. However, the governing body of the International Labour organization, at its 128th session, decided to ask member governments whether they favoured the adoption of international instruments in the form of conventions or recommendations on various aspects of the conditions of employment of fishermen, including minimum age for employment and medical examination. During the year, various child-labour conventions were ratified: no. 5, 14-year minimum age for employment in industry, by Bolivia; no. 58, 15-year minimum age for employment at sea, by Argentina and Denmark; no. 59, 15-year minimum age for employment in industry (as revised in 1937), by Cuba; no. 60, 15-year minimum age for nonindustrial employment (as revised in 1937), by Cuba; no. 77, medical examination of young persons in industry, by Argentina; no. 78, medical examination of young persons in nonindustrial employment, by Argentina and Cuba; no. 79, night work of young persons in nonindustrial employment, by Argentina and Cuba; no. 90, night work of young persons in industry (as revised in 1948), by The Netherlands. (E. S. J.)

Great Britain.—Juvenile labour continued to be in keen demand, and consequently a wide range of work was available for school leavers. Between Jan. 1954 and Jan. 1955 the youth employment service placed 221,000 boys and 228,000 girls in employment, a slight decrease on the 1953 total. Of these, 240,000 were school leavers entering their first situation, 4,000 less than in the previous year. The ratio of young persons (aged 15–18) to the total of employees remained practically constant, the number of boys being 5% of the total of male employees, and the number of girls about 9½% of the total of female employees. The largest increase during the year was in distributive trades (+6,000 boys and +9,000 girls) and there was also a substantial increase in textile industries. The number of boys entering employment in mining and quarrying fell from 12,758 to 11,743. The comparative scarcity of young people between 15 and 18 underlined the importance of the vocational guidance,

placing and "follow-up of progress" carried out by the youth employment service, and of the encouragement given to industries and firms to develop systematic recruitment and training schemes for young workers. Ten new national schemes of recruitment and training were agreed by the industries concerned, bringing the total to more than 90. In placing juveniles, youth employment officers paid particular attention to the type of training and facilities for further education offered by employers. A survey of training arrangements in six selected industries, completed during 1954, showed that the local application of agreed schemes was uneven, and that much could still be done to improve the standard of training given to young workers. In regard to the release of young workers for part-time classes, the survey revealed that the local provision of such classes was generally adequate, but that there was still some reluctance on the part of employers to release their young workers as well as some failure on the part of young workers to realize the benefits of further education.

Under the special aptitudes scheme grants were awarded to 1,100 young persons to enable them to take up work suited to their abilities in other areas. (See also CHILD WELFARE; JUVENILE DELINQUENCY.) (W. O. L. S.)

Children's Books. A profusion of children's books were published in the United States during 1955. Informational material, attractively presented, predominated, with helicopters (*Helicopters: How They Work* by John Lewellen), electronics (*Electronics for Young People* by Jeanne Bendick) and atoms (*Atoms Today and Tomorrow* by Margaret O. Hyde) among the complex subjects made simple and appealing. Uniform editions continued strong, as established series added new titles and new series were launched.

Picture books were bold and original in design. Dr. Seuss's new fantasy, *On Beyond Zebra*, and Virginia Kahl's *The Duchess Bakes a Cake* evoked hearty laughter. *Poppy Seeds* (Clyde Bulla) pictured the heart-warming faith of a Mexican village boy. Louise Fatio presented another tale of her gentle adventurer in *The Happy Lion in Africa*. Forgetfulness rather than timidity troubled the engaging hero in *Theodore Turtle* by Ellen MacGregor. An elusive gentleness captivated little children who were read *Play With Me* by Marie Ets and a dreamlike quality pervaded Ruth Krauss's *Charlotte and the White Horse*. An old Scottish ballad provided material for a delightful picture book by John M. Langstaff, *Frog Went a-Courtin'*. German folk tales provided material for two others: *The Traveling Musicians* (J. L. K. and W. K. Grimm) and *Hinkeldinkl* (Frank Jupé).

Many rich collections distinguished the year's output of books for children. *The Illustrated Treasury of Children's Literature* by Margaret Martignoni made available in one volume classics suitable for children of preschool age to 12. *The Magic Listening Cap* (Yoshiko Uchida) retold 14 Japanese folk tales; *Welsh Legends and Folk-Tales* (Gwyn Jones) made days of magic and knighthood live again. *French Legends, Tales and Fairy Stories* (Barbara Picard) and *Fables of India* (Joseph Gaer) brought treasures from still other countries. Corydon Bell's *John Ratling-Gourd of Big Cove* was rich with stories and legends of the Cherokee Indians.

Fantasies had wide appeal. Parents and children chuckled together over Meindert DeJong's *The Little Cow and the Turtle*, Frances and Richard Lockridge's *The Cat Who Rode Cows*, Walter Edmonds' *Uncle Ben's Whale* and George Plimpton's *The Rabbit's Umbrella*. Hard luck changed to soft luck in Marjorie Rawlings' *Secret River* and Lee Kingman's Finnish story, *Mikko's Fortune*. A lively, suspenseful fairy tale was Margot Benary-Isbert's *The Wicked Enchantment*. A beautiful friendship between a boy and his grandmother was told in the English

fantasy, *Children of Green Knowe* by L. M. Boston. Strands from various folk tales combined in the fabric of *The Wonderful Lamp* by Max Voegeli. Imaginative children welcomed the distinguished fantasy, *The Borrowers Afield* by Mary Norton. Magical happenings appeared on every page of C. S. Lewis' *The Magician's Nephew*.

Family fun was shared in Pamela Brown's *The Windmills of My Family* (English), Adèle and Cateau De Leeuw's *The Expatriate Browns* and M. L. Chastain's *Fripsey Fun*.

Pet and animal books were favourites. Lois Lenski's *A Dog Came to School* delighted little children. An airedale reformer in his family in Anne H. White's *Junket*. A book of beauty, *The Littlest Mouse*, pleased Dorothy Lathrop's many readers. A otter escaped the hazards of the deep in *Amikuk*, a tale of sea life about the Aleutian Islands by Rutherford Montgomery.

Nature was treated in many fine volumes for young children: *The Pond Book* (Albro Gaul), *Seashores* (H. S. Zim and Lester Ingle) and *See Through the Sea* (Millicent Selsam and Betty Morrow) among them.

Science subjects were treated in a lively, understandable manner. Several new titles in the "First Book Series" were notable contributions. In *Men, Microscopes, and Living Things* Katherine Shippen showed the progress of man's understanding of living matter from Aristotle to the present, through lives and work of great biologists. Irving Adler's *Time in Your Life* vividly established the significance of rhythm in living things. The past concerned writers of informational books: *Nefertiti Lives Here* by Mary Chubb (Egyptology), *The Story of Our Ancestors* by May Edel (anthropology) and *Dinosaurs* by Marie H. Bloch.

Other lands provided the setting for many outstanding contributions of the year. From Mexico came the long-cherished story of a miracle in Helen Parish's *Our Lady of Guadalupe* and an on-stage story of a Mexican fiesta, *The Fabulous Fireworks Family* by James Flora. From Guatemala came the material for the distinguished character portrayal in A. N. Clark's *Santia*. There was a fairy-tale quality in *Philomena*, a story of an eight-year-old Bohemian girl by Kate Seredy. *The Twins in South Africa* (Daphne Rooke) was a captivating story for the child of eight to ten. The South Pacific provided its share of background material: William Lipkind's *Boy of the Islands* took readers into a Hawaiian boy's life and Denis Clark wrote beautifully of the Australian bush country in *Boomer*.

Adapting to new environments was a prevailing note in much of the fiction writing. Through reading *The Golden Name* by Jennie D. Lindquist, children saw American life enriched by the rich contributions of another country. A war-orphan cousin from Italy is absorbed into the New York Leoni family in *Big Little Island* by Valenti Angelo. In a cheerful story *Bronko*, Rosa Eichelberger told the adventures of a boy coming from the concentration camps of Europe to a new home with his mother on New York's east side.

The year saw the publication of several fine biographies for children's enjoyment. *Prairie-Town Boy* (Carl Sandburg) was a shortened version of his *Always the Young Strangers*, a story of his growing up. Explorers were subjects of several fine biographies. Two handsome picture books about Columbus were Aldagliesh's *The Columbus Story* and Ingri and Edgar Pap d'Aulaire's *Columbus*. Vivid biographies for the child of eight to ten were *Henry Hudson* by Ronald Syme and *Captain Cook Explores the South Seas* by Armstrong Sperry. *The Silver Swallow* was a sensitive story of Elizabeth Barrett Browning's romance by Constance Burnett. Elizabeth Ripley presented *Ripbrandt*, including excellent black and white reproductions of his work. An able contemporary English author, Geoffrey Trevelyan chose his subjects for *Seven Kings of England* for the dramatic quality of their lives. Hedvig Collin's *Young Hans Christ*

Andersen fittingly punctuated the 150th anniversary of the Danish author's birth.

Historical fiction provided engrossing reading for older boys and girls. *Triumph for Flavius* (Caroline Snedeker) was a story of a Roman conqueror's son and his friendship for a Greek slave. *The Great Axe Bretwalda* (Philip Ketchum) was an excellent story of ancient Britain, King Alfred, knights and ladies. Notable among works of fiction based on American history were *Stampede for Gold* (Pierre Berton), *A Spy in Williamsburg* (Isabelle Lawrence) and *The Mighty Soo* (Clara Judson).

Among adventure stories of the sea that enticed readers were *Ice to India* by Keith Robertson and *Captain Cook Explores the South Seas* by Armstrong Sperry. Nicholas Monsarrat's *The Boy's Book of the Sea* was a rich collection of sea episodes.

Mystery prevailed in *Crystal Mountain* (Belle Ruth), in which an American and an English boy were sleuths in Beirut, Lebanon. Modern Edinburgh with its legend-haunted alleys provided the backdrop for *The House of the Pelican* (Elisabeth Kyle).

New editions of old favourites included Frank Stockton's *Ting-a-Ling Tales*, F. H. Burnett's *Little Lord Fauntleroy* and S. M. Gruenberg's *Favorite Stories Old and New*. H. C. Andersen's *The Ugly Duckling* was presented separately in soft colour.

No discussion of the year's output of books for children would be complete without comment upon *The Art of Beatrix Potter*, a historical study of the work of the author-artist long loved on both sides of the Atlantic, with a foreword by Anne Carroll Moore. Annis Duff's *Longer Flight* delighted readers of *Bequest of Wings* for its sensitive, sound observations on introducing young people to the delights of reading. (See also BOOK PUBLISHING AND BOOK SALES; LITERARY PRIZES.) (S. Wr.)

Child Welfare. Evaluations of child welfare needs and resources during 1955 were far-reaching. World-wide or regional studies were begun or continued by specialized agencies of the United Nations or other international bodies. Conferences of professional workers directed attention to the problems of seriously handicapped children, especially the mentally retarded. There was a decrease in relief programs under international auspices but a marked increase in long-range planning toward a social climate conducive to child welfare.

International Services.—The tenth Pan American Child congress in Panamá, Feb. 6–12, 1955, dealt with education and social service but concentrated its attention in the field of health. Nutrition and related subjects, including the production of milk and protection of milk by pasteurization and manufacture of powdered milk, were considered in the light of various projects sponsored in recent years by the Pan American Sanitary bureau, which is the regional unit of WHO (World Health organization) for the Americas. The needs of crippled children were discussed, with emphasis upon rehabilitation. Juvenile delinquency was a matter of major concern in all of the 21 American republics. Those assembled considered measures for the prevention of delinquency, including the strengthening of family life, and for the improvement of the juvenile courts, institutions and other agencies serving juvenile delinquents. The need for adequate child welfare facilities and services in rural areas was recognized and recommendations included proposals for the special training of social workers for service in rural areas. Inadequacies of vital statistics were another concern and steps were urged toward developing uniform statistics, already begun by the American International Institute for the Protection of Childhood and co-operating organizations within the UN.

The World Child Welfare congress in Zagreb, Yugos., held late in 1954, emphasized the importance of helping children before their problems became acute and, toward this end, the

strengthening of family life. Findings of the conference included recommendations for the centring of social planning and social services upon the family, with children given preference over others within the family; supplementary wages which would allow employed mothers to work no more than half time outside the home; education for parenthood during the years of common-school education and military service; care for handicapped and sick children, wherever practical, in the home or in hospitals where the mother may be with her child; facilities in the home and community for treatment, education and vocational training of mentally deficient children; and special protection for the child born out of wedlock and children from broken homes. It was agreed that in case of war or other catastrophe children should be separated from their families only when physical survival requires, and that the family should be preserved as a unit, whatever its customary standards may be.

The sixth world congress of the International Society for the Welfare of Cripples, held in 1954 at The Hague, Neth., agreed that popular understanding of the purposes, methods and content of programs for rehabilitation of the crippled is essential to their development.

The United Nations Children's fund (formerly the United Nations International Children's Emergency fund and still officially designated as UNICEF) was expanded in 1955. Seven governments which contributed to the fund for the first time brought the total participating to more than 70, with probable pledges and receipts of about \$20,000,000 for 1955. For the fiscal year 1955 the United States congress appropriated \$12,500,000. About 90% of the fund's support had been from governments, the balance from voluntary organizations and individual contributors.

During 1955 UNICEF expected to exceed its goal of approximately 32,000,000 children and pregnant or nursing mothers as beneficiaries of its principal health and nutrition programs. The number to be vaccinated with BCG (*Bacillus-Calmette Guérin*) in the fund's antituberculosis campaign promised to be more than 15,000,000. Since the fund's campaign against tuberculosis began in 1948, about 140,000,000 persons had been tested to determine their susceptibility and about 60,000,000 treated with vaccine. Other objectives of UNICEF programs in 1955 were to protect approximately 7,000,000 from malaria with DDT; to give daily rations through maternal and child welfare centres and school lunch programs to 4,000,000; emergency feeding, 4,000,000; treatment for control of yaws, 1,200,000; treatment for control of trachoma, 900,000. Cumulative services in the control of yaws, including 1955 and the previous years, consisted of about 23,000,000 children and mothers examined and 5,000,000 treated.

United States.—The Salk vaccine for poliomyelitis, which became available during 1954 to a limited control group of children, was made available by the federal government during 1955 to all children under ten years of age. For several months the distribution of this vaccine was held up because the output from certain laboratories seemed to be related to the development of the disease in a number of cases. With supplies of vaccine tested under government supervision and the adequacy of remaining stocks assured, the campaign of inoculation was resumed and expanded. A similar campaign against polio was conducted in Canada.

Another important discovery in the field of child health tended to reduce blindness among infants. Reduction in the supply of oxygen administered to premature babies, in a study including several hundred infants, showed that less than half as many developed retrolental fibroplasia as were victims when the larger supply of oxygen in routine treatment was provided.

Other highly publicized child welfare developments pertained

INDOCHINESE ORPHANS, removed from communist-held Haiphong to Saigon by the Vietnamese government in collaboration with the U.S. Operations mission and French authorities, enjoy an improvised picnic aboard the U.S.S. "Marine Serpent" April 16, 1955

to mentally retarded children and delinquent youth. Councils of parents of mentally retarded children were operated in more than 40 states as affiliates of the National Association for Retarded Children. The efforts of such groups of parents and other interested citizens and professional workers were concentrated on services to the mentally retarded at home, at school and in training schools, with special emphasis upon the rehabilitation of those who previously received little or no training. Several states began studies of the facilities and services within their borders. In some, as in Massachusetts, laws were passed assuring more adequate provisions for children thus handicapped.

The number of children coming before juvenile court authorities on account of delinquency increased for the sixth year in succession, according to a report from the children's bureau of the department of health, education and welfare. The bureau's division of juvenile delinquency, established in 1954, continued studies begun in 1953 by a subcommittee of the U.S. senate. There was general agreement that a substantial reduction in juvenile delinquency could be expected if there were a general increase in the stability of families. As never before there was a tendency for schools, social agencies and law enforcing bodies to recognize that emotional disturbance must be detected more frequently and at earlier ages if steps for reducing delinquency were to be effective. This was one of the findings of a conference on health services and juvenile delinquency held in Washington, D.C., May 19-21, 1955.

Progress in the control of child labour was especially noticeable in its application to children of migrant labourers. State officials and local communities, assisted by national religious bodies, the National Child Labor committee and federal authorities, were obtaining co-operation as never before from industries which employed migrants. Educational, religious, recreational and health services were being provided. Another concern of child labour authorities was the need for additional controls in the employment of teen-age boys in bowling alleys, often at hours when they should be asleep and for periods long enough

to produce excessive fatigue.

Conferences contributing to the welfare of children included the National Conference on the Churches and Social Welfare, Cleveland, O., Nov. 1-4, 1955, and the White House Conference on Education, Washington, D.C., Nov. 28-Dec. 1, 1955.

A decline in the number of orphans in the United States was reflected in the U.S. census. The number of full orphans dropped from 750,000 in 1920 to 66,000 in 1953. In 1920 the proportion of children who had lost one or both parents was 1 in 6, in 1953 it was 1 in 20. Increasingly the children in need of foster care in family homes or institutions were from homes broken by desertion, divorce or separation. The U.S. census (1955) showed 260,429 persons under 21 years of age living in all types of institutions. The total in institutions for dependent and neglected children was 95,260.

Outstanding among publications was the pamphlet *Infant Care* produced by the federal children's bureau. In 1954 and 1955 more than 1,000,000 copies were sold. Since its original publication in 1914, 35,000,000 copies of this guide to child health have been sold or circulated without charge. (See also CHILD LABOUR; INFANT MORTALITY; JUVENILE DELINQUENCY; RED CROSS; SOCIAL SECURITY; TUBERCULOSIS; WORLD HEALTH ORGANIZATION.)

Chile. A republic extending along the southern Pacific coast of South America for about 2,600 mi., Chile has an average width of 110 mi. It is bounded on the north by Peru on the south by the Antarctic ocean, on the east by Bolivia and Argentina and on the west by the Pacific ocean. It has an area of 286,396 sq.mi. and a population of (April 1952 census) 5,930,809; (1955 est.) 6,560,000. Santiago, the capital, including suburbs has 1,348,283 inhabitants (April 1952 census). Other leading cities of more than 50,000 are Valparaíso, 218,829 inhabitants; Viña del Mar, 85,281; Concepción, 119,887; Antofagasta, 62,272; Talca, 55,059; Temuco, 51,497; Chillán, 45,576; Talcahuano, 54,782. Religion: Christian, mainly Roman Catholic. President in 1955: Gen. Carlos Ibañez del Campo.

History.—President Ibañez and the Chilean congress failed to agree on a program to curb the inflation that threatened in 1955 to upset the national economy. The soaring cost of living (the June 1955 index was 78% above that of June 1954) activated a wave of strikes, most of which resulted in wage increases which sent prices higher.

Effective governmental action was inhibited by strife between the executive and legislative branches. The opposition-controlled congress refused to grant President Ibañez extraordinary powers to deal with the economic situation, and accused him of dictatorial ambitions. Cabinet shake-ups occurred frequently, and paralysis spread to the judiciary in October, when the supreme court endorsed the mass resignation of Santiago justices and court employees who were dissatisfied with their salaries.

The Central Labor organization (Confederación Unica de Trabajadores Chilenos) called a 24-hr. general strike on July 1 to emphasize the workers' demands for a 60% pay increase and other benefits. An estimated 1,000,000 persons took part in a nation-wide demonstration. The cabinet negotiated assiduously to prevent a threatened recurrence of the general strike,

ailed to stop 50,000 government employees from temporarily walking off the job in August at the instigation of Clotario Blest, head of the Central Labor organization. Many persons were arrested for violation of the controversial "Law for the Defense of Democracy," which prohibited strikes in the basic public services and outlawed the Communist party in Chile. President Ibañez declared a state of siege (martial law and suspension of civil liberties) in five provinces in September in order to halt a strike at the giant U.S.-owned Chuquicamata copper mine. He was empowered to issue such a decree because congress was in recess at the time of the emergency. Important labour conflicts also occurred in the transportation, communication and textile industries.

Export earnings rose in 1955, reflecting the demands of U.S., British and West German industry for Chilean copper. Copper production responded to a more favourable tax law adopted by the Chilean government in May, which provided for a basic tax (50%) on the operating income of the large U.S.-owned copper mines, plus a 25% surtax which would gradually be reduced as production increased. Previous assessments amounted to about 35% with no special incentive for higher output. More attractive export exchange rates were set for both copper and nitrate industries. Such concessions to foreign capital prompted the announcement of several substantial expansion programs. Production of nitrates was good and moderate advances were noted in the steel, paper, petroleum and cement industries.

Higher yields of major crops (including wheat, barley, oats, rice, corn, beans and potatoes) in the 1954-1955 season enabled Chile to reduce imports of some commodities. Considerable surplus wheat was nevertheless purchased from the United States.

International disagreements centring on questions of sovereignty occasionally diverted the attention of Chileans from domestic problems. Like Peru and Ecuador, Chile claimed jurisdiction over its coastal waters to the 200-mi. limit. A U.S. suggestion that the matter be submitted to the International Court of Justice for adjudication was rejected. Chile likewise rejected an offer by Great Britain to place conflicting claims to territory in the antarctic region before the International Court of Justice. (See FOREIGN INVESTMENTS.) (R. HN.)

Education.—In 1951, 5,064 primary schools had an enrolment of 721,179 pupils; 332 secondary schools (1952) had 86,652 pupils. University education was available at the state university of Chile (7,451 students in 1951), the Catholic university of Santiago (1,754 students), the University of Concepción (1,419 students) and the Catholic university of Valparaíso (637 students). Public education was scheduled to receive 1% of government expenditures in 1955.

Finance.—The monetary unit is the peso, valued at 0.91 cents U.S. currency, official rate, and at 0.49 cents, principal rate, during 1955 and at 0.15 cents, free market rate, on Sept. 16, 1955. The 1955 budget, as approved by congress in Dec. 1954, estimated revenue at 91,640,078,917 pesos and expenditure at 91,639,948,917 pesos; a supplemental budget of 12,000,000,000 pesos was submitted to congress in Aug. 1955. The 1956 budget, as submitted to congress in Aug. 1955, estimated revenue at 131,580,000,000 pesos and expenditure at 153,460,000,000 pesos. In 1954 ordinary revenue was 74,416,000,000 pesos; expenditure, 82,932,000,000 pesos. The funded external debt on Dec. 31, 1953, was £17,440,974, 1106,595,500 and 85,832,400 Swiss francs; the direct internal debt, 10,163,370,454 pesos. Currency in circulation (March 31, 1955) totalled 16,851,000,000 pesos; demand deposits (Nov. 30, 1954), 49,440,000,000 pesos. The U.S. department of commerce estimated U.S. direct investments in 1954 at \$633,000,000, of which mining and smelting investments accounted for \$407,000,000. The cost-of-living index (Santiago) stood at 199 in Aug. 1955 (1948=100). National income was estimated at 498,130,000,000 pesos in 1954.

Trade and Communications.—Exports in 1954 (excluding gold) amounted to \$403,100,000; imports, \$343,000,000. Leading exports were copper (59%), nitrate of soda (17%), metallurgical products (5%), timber and forest products (4%) and agricultural products (3%); leading imports, industrial oils, chemical products and paints (16%), machinery (15%), transport materials (12%), raw cotton (8%) and petroleum and products (7%). Chief customers were the U.S. (46%), the United Kingdom (14%), Argentina (9%), Germany (7%) and Italy (4%); chief suppliers, the U.S. (41%), Argentina (15%), Germany (8%), Peru (7%) and the U.K. (5%).

The railway system totalled 5,434 mi. in 1949, of which 3,859 mi. were owned by the government. In 1951 there were 31,215 mi. of highways. On Jan. 1, 1955, there were 45,882 automobiles, 38,565 trucks and 1,951 buses. According to *Lloyd's Register of Shipping*, the merchant

marine had 99 vessels (100 tons and over) aggregating 210,592 gross tons on June 30, 1954. Telephones (Jan. 1, 1954) numbered 145,139, 69% of which were automatic and 56% of which were located in Santiago.

Agriculture.—Production of the principal crops in the crop year 1954-55 was estimated as follows (in metric tons): wheat 1,078,000; barley 89,000; oats 108,000; rice 93,000; maize 102,000; potatoes 617,000. Livestock included (1954) cattle 2,363,700, (1951) 650,000 pigs, 6,500,000 sheep, 830,000 goats and 600,000 horses. Wool production in 1954 (clean basis) was 9,000 metric tons.

Manufactures.—Production estimates (1954) included steel 320,949 metric tons; pig iron 305,145 tons; wheat flour 619,200 tons; cement 775,200 tons; woven cotton fabrics, about 47,000,000 metres; caustic soda 4,000 tons; sulphuric acid 20,000 tons; tires 192,000 units; manufactured gas 151,200,000 cu.m.; electric energy 2,265,000,000 kw.hr. In 1954 there were about 198,000 cotton spindles and 8,026 looms and 81,100 wool spindles and 1,320 looms. The index for manufacturing industries averaged 148 in 1954 (1948=100).

Minerals.—Production in 1954 included copper 363,655 metric tons; nitrate of soda 1,574,309 tons; iodine 1,147 tons; iron ore 2,199,039 tons (exports 1,719,893 tons); coal 2,267,329 tons; silver 1,489,000 fine oz.; gold 125,000 oz. Petroleum production on Tierra del Fuego totalled 227,000 metric tons (about 1,740,000 bbl.).

China. China borders Korea, the U.S.S.R., Outer Mongolia, Afghanistan, Nepal, Burma, Indochina and the Pacific ocean. The area is approximately 3,911,209 sq.mi. including Manchuria, Sinkiang, Tibet and Formosa. In Nov. 1954 the Peking government announced that as of June 30, 1953, the total population was 601,938,035 including more than 19,000,000 outside the mainland.¹ Politically the country remained divided in 1955 into two entities each claiming jurisdiction over the other: (1) the People's Republic of China on the mainland plus Hainan and other islands under the Central People's government in Peking with Mao Tse-tung (q.v.) as its chairman; (2) the Republic of China on Formosa and the Pescadores plus some off-shore islands under the National government in Taipei with Chiang Kai-shek (q.v.) as its president.

The People's Republic of China consisted of 26 provinces and the autonomies of Inner Mongolia, Tibet and Sinkiang-Uighur region, the establishment of the latter being announced in Sept. 1955. The three largest municipalities remained under the direct administration of the Central People's government: Peking, Tientsin and Shanghai with populations in 1954 estimated at 2,900,000; 2,700,000; and 6,200,000, respectively. Other cities with more than 1,000,000 population in 1952 were: Chungking, 2,000,000; Mukden, 1,790,000; Canton, 1,210,000; Wuhan (Hankow and Wuchang), 1,090,000; Nanking, 1,020,000; Port Arthur and Dairen, 1,010,000; Harbin, more than 1,000,000.

History.—The People's Republic of China celebrated its fifth anniversary on Oct. 1, 1954, with greater confidence and triumphant fanfare and significantly with the presence and participation of an important Soviet delegation including such Russian leaders as Nikita S. Khrushchev, Nikolai A. Bulganin and Anastas I. Mikoyan. Although the internal political, economic and social difficulties confronting the Republic found no easy solutions, its government showed greater determination and flexibility to win respectability and recognition as a great world power and the sole government for China. "Liberation of Taiwan" and peaceful coexistence with other countries continued to be a central theme in Peking's propaganda and an inseparable policy in Peking's military activities and diplomatic negotiations and manoeuvres. Early in 1955 Peking's move and threat to take the offshore islands and Formosa caused uncertainties and anxiety in many of the capitals of the world and particularly a storm of controversy in the United States that underscored the policy debate and division in the United States and the free world over the problem of China. Thus, in 1955 the tension in the Formosa straits sharpened fundamental questions relating to Formosa's legal status and the future of the Nation-

¹ The total population figure, which is more than 100,000,000 greater than any previous, is generally regarded with considerable reserve.

alist government.

In 1955 major political developments on the mainland of China included the intensified campaign against the counter-revolutionaries and the purge of the once all-powerful head of the northeastern provinces (Manchuria), Kao Kang, and of his alleged coconspirator Jao Shu-shih, former boss in east China and chairman of the Chinese Communist Party's Organization bureau. A national conference of the Chinese Communist party held in March 1955 adopted resolutions on the liquidation of the Kao-Jao group and on related questions. In early April the Seventh central committee of the party, which held the real power, approved these resolutions. The second session of the first National People's congress was held in July to approve the reports on Kao-Jao affairs and the final text of the five-year plan and to hear Premier Chou En-lai's report that in conformity with the principle of easing international tension and settling disputes through negotiations, Peking had taken a series of steps to improve relations with the United States.

The decision to re-examine the five-year plan and to tighten the food ration reflected economic conditions during 1955 in continental China. The plan launched in 1953 with Soviet economic aid and an emphasis on the development of heavy and defense industries and on socialization of agriculture apparently fell behind schedule, and on the basis of the discussion at the national conference of the Chinese Communist party the central committee was instructed to make revisions and submit the plan to the second session of the National People's congress for adoption. In outlining the plan to the congress Vice-Premier Li Fu-chun, head of the State Planning commission, concluded that it would still take another 15 years or more to carry out a "Socialist transformation" of China and about 50 years to achieve a "high degree of Socialist industrialization," and that despite the difficulties encountered in agricultural collectivization Peking would not change its course.

Food shortage on the mainland of China was reportedly acute partly because of floods and droughts. As an attempt to increase food production and reduce the number of urban mouths to feed, the government took effective steps in July to send large sections of the population in Shanghai and other large cities back to their native villages to take up farming.

Somewhat parallel with the "new look" in Moscow, Peking emphasized in 1955 a foreign policy of peaceful coexistence. While it continued to strengthen its ties with the Soviet Union and friendly Asian countries, Peking relaxed its anti-American campaign and aloofness from other western powers. Formal diplomatic relations had been established between the People's Republic of China and Denmark, Sweden, Finland and Switzerland before the 1954 Geneva conference.

Later Peking and London exchanged chargé d'affaires with diplomatic status and Peking agreed to formalize its relations with Norway and the Netherlands. Diplomatic relations between Peking and Belgrade were established in January 1955, five years after Yugoslavia had offered recognition to Peking. A series of agreements on greater trade and closer relations were concluded between the People's Republic of China and Asian countries friendly to Peking: Indonesia, Burma, Vietnam, North Korea and Outer Mongolia. In January and August 1955 Peking established formal diplomatic relations with Afghanistan and Nepal, respectively.

During his visit to Indonesia in April, Premier Chou and the Indonesian premier signed a treaty whereby persons with dual Chinese and Indonesian citizenship had to choose a single nationality within two years. By implication the treaty gave Indonesian support to Peking's claim to Formosa and control of overseas Chinese. For the purpose of strengthening trade and diplomatic relations, Premiers Nehru of India and U Nu of

Burma paid a return visit to Peking in October and November 1954, respectively, and Premier Ali Sastroamidjojo of Indonesia and Pres. Ho Chi-minh of Vietnam visited Peking in June and July 1955. As a result of their visits joint communiques were issued reaffirming the principles of peaceful coexistence and relaxing international tensions. Subsequently the spokesmen of India and Burma made special efforts to convince the United States of Peking's peaceful intention on the one hand and the other strongly supported Peking's claim to Formosa and seat in the United Nations in a number of international pronouncements.

Peking's active diplomatic efforts in 1955 were in line with a joint declaration of Oct. 11, 1954, issued in Peking containing seven agreements and statements of policy arrived at in negotiations between Peking and Moscow. Concerning China-Soviet future relations Moscow agreed to evacuate Port Arthur by May 31, 1955, to provide additional economic aid to speed up Chinese industrialization, and to dissolve four joint Soviet-Chinese stock companies. With regard to international situation the joint declaration condemned "United States occupation of Formosa," the continued partition of Korea and the creation of "an aggressive block" in southeast Asia; called on Japan to normalize its relations with Peking and Moscow; and pledged close co-operation on all the far eastern issues. It stressed the policy of peaceful coexistence and the need for international discussions among the great powers to settle differences, and considered the exclusion of the People's Republic of China from the United Nations as untenable.

Just three days before the opening of the southeast Asia security conference in Manila on Sept. 6, 1954, Peking stepped up its attack on the offshore islands held by the Nationalists. November fighting between the Communists and Nationalists in the Formosa straits was intensified and it was officially announced that negotiations between the United States and the Republic of China for a security treaty were soon to be concluded. On Dec. 2, 1954, the Chinese-American mutual defense treaty was signed in Washington, D.C., by Foreign Minister George Yeh and Secretary of State John Foster Dulles. While the treaty explicitly committed the United States to defend Formosa and the Pescadores, the exchange of notes clearly indicated that the United States would not support a Nationalist landing on the mainland unless the United States gave its prior consent and that the Nationalists could only attack the mainland in self-defense. On Jan. 15, 1955, the Legislative Yuan of Formosa ratified the Chinese-American defense treaty unanimously. On Jan. 29 Pres. Dwight D. Eisenhower signed a congressional resolution overwhelmingly endorsing his request and authority to defend Formosa and the Pescadores at the risk of war. The U.S. senate approved on Feb. 9 the treaty by a 64 to 6 votes.

While the debate and speculation over the position of the United States in relation to the offshore islands continued, Peking concentrated heavy air attacks on the Tachen group. The Nationalists finally agreed to evacuate Tachen but failed to receive a more definite public guarantee from the United States to defend Quemoy and Matsu. On Feb. 7 the U.S. 7th fleet arrived off Tachen to evacuate Nationalist civilians and troops totalling more than 30,000 persons. The withdrawal from Tachen group reduced the Nationalist outer ring defense to Quemoy and Matsu groups.

The detention of U.S. servicemen and civilians in China came an important issue between Peking and the U.S. On Nov. 23, 1954, when final negotiations on the Chinese-American defense treaty were under way, Peking radio announced that two airmen and two civilians from the United States had been sentenced to long prison terms as spies. President Eisenhower s

delegates to a trade union congress in Canton in March signing an "appeal to the peoples of the world" against the use of atomic weapons

that the jail sentences just imposed on the 13 Americans were intended "to goad us into some impulsive action in the hope of dividing us from our allies." Consequently the United States in early December proposed that the United Nations general assembly act promptly and decisively to bring about the release of the prisoners of the Korean war. Following the adoption by the general assembly on Dec. 10, 1954, of a resolution condemning as contrary to the Korean armistice agreement the trial and conviction of prisoners of war illegally detained after Sept. 1953, Sec. Gen. Dag Hammarskjöld immediately proposed a meeting with Premier Chou in Peking. On Jan. 5, 1955, Hammarskjöld and his aides arrived at Peking. It was reported that during their talks Premier Chou voiced fear of invasion of the China mainland by the United States. Upon his return Hammarskjöld stated on Jan. 16 that he was planning to send a message to Peking clarifying the United States commitments to Nationalist China under the Chinese-American treaty and that the chances for the ultimate release of the U.S. airmen and other UN prisoners would be improved when Peking learned the exact meaning of that treaty.

A significant change of attitude by Peking toward the U.S. took place at the Asian-African conference opening on April 18, 1955, in Bandung, Indonesia, from which Nationalist China was excluded. By adopting a conciliatory attitude Peking created a tremendous impression at the Bandung conference. On April 23 after a luncheon with the leaders of Asian countries Chou En-lai released a statement indicating the willingness of his government to enter negotiations with the U.S. government to discuss the question of relaxing tension in the Formosa area. In a responsive statement the U.S. state department suggested that the Nationalists should participate as an equal in any discussions affecting the Formosa area. In his closing speech at the Bandung conference, April 24, Chou remarked that any negotiations with the United States should not affect his government's sovereign rights in "liberating Taiwan." In a resolution supporting Peking's position, the Bandung conference called for the withdrawal of U.S. forces from Formosa and the Pescadores and for a 10-power conference as previously suggested by Moscow to settle the Formosa question.

After the Bandung conference a *de facto* cease-fire existed insofar as Peking and the U.S. were concerned. At the Geneva conference of the heads of the Big Four Powers the Formosa issue was informally discussed. Shortly after that meeting Peking and the U.S. jointly announced on July 25 that "talks" on an ambassadorial level would be conducted to discuss: (1) the question of repatriation of civilians; (2) "certain other practical matters now at issue between both sides." In announcing the date and place for the meetings of Ambassadors U. Alexis Johnson and Wang Ping-nan, the state department declared that these talks did not involve diplomatic recognition.

Just before the talks began in Geneva on Aug. 1, Peking announced that the 11 airmen were being released. Negotiations on the release of civilians dragged on as Peking insisted on a proposal for having India screen Chinese nationals in the United States whom Peking believed had been detained from going back to the mainland. On Aug. 19 Nationalist Foreign Minister Yeh declared that the United States had no right to surrender Chinese residents in the United States to Peking or to any third nation as they were not prisoners of war but under legal protection of his government. Finally a compromise was reached on Sept. 10 when Peking agreed to set free all 41 U.S. civilians and the United States reaffirmed the right of any Chinese in the United States to return to mainland China and agreed to have India to assist any Chinese who might need such assistance. Although by Sept. 20 only 9 of the 41 civilians were free to return to the United States, it was announced that talks

would continue to take up both items on the agenda simultaneously. On the same day the 10th session of the general assembly by a vote of 42 to 12 with 6 abstentions adopted a United States proposal, which was introduced in reply to a Soviet resolution to seat Peking, deferring the consideration of China's representation in the United Nations for another year. (See also COMMUNISM; FORMOSA; UNION OF SOVIET SOCIALIST REPUBLICS.)

Education.—According to a Peking announcement there was a record enrollment of about 3,500,000 in secondary schools and 55,500,000 in primary schools on the mainland in Sept. 1955 as compared with 3,000,000 and 53,000,000 respectively, in 1953. In Sept. 1955 there were 289,000 college or university students, as against 220,000 in 1953.

Defense.—In order to further the building up of the Chinese People's Liberation army, Peking introduced stricter compulsory military service in 1955. Its regular army was estimated at 3,000,000 to 4,000,000 men supplemented by a few millions of home defense militia. Peking's air force was reported to consist of about 2,000 planes including 850 jets and 380 bombers, mostly of Russian origin.

The Nationalist army, estimated at 600,000, was being gradually fashioned into a modern fighting force with U.S. assistance, and by conscription of Formosan recruits the average age of the Nationalist army in 1955 was brought down to 25 years from nearly 30 in 1953. The combat strength of the Nationalist air force was estimated at less than 500 planes, including a good number of jets. Under the wing of the U.S. 7th fleet, the Nationalist navy of more than 100 small vessels became a defensive and harassing force in the Formosa straits.

Finance.—To improve the currency system on the China mainland a new Yuan was made of 10,000 old Yuan on March 1, 1955. All prices were adjusted according to this official rate, and foreign exchange remained unchanged in value (roughly U.S. \$1=2.4 Yuan and £1 sterling=6.8 Yuan). On the basis of the new currency and according to the official report, the 1954 revenue and expenditure were 30,745,830,000 and 24,632,440,000 Yuan respectively. About 69% of the 1954 revenue came from state and joint state-private enterprises. Economic construction counted for more than 50%, national defense 23.6% and education and culture 14% of the total expenditure in 1954. The 1955 budget estimates were: revenue, 31,192,520,000 Yuan; expenditure, 29,736,720,000 Yuan. More than 60% of the 1955 budget would go to construction and social services, while over 24% would be devoted to national defense.

Trade and Communications.—According to Peking's finance minister the total volume of foreign trade registered an increase of 4.5% in 1954 and imports and exports in the main balanced each other. In 1954 more than 80% of Peking's foreign trade was with the Soviet Union and People's Democracies compared with 75% for the previous year. Trade with India, Burma, Indochina, Ceylon, Pakistan, the United Kingdom and Japan was expected to increase. Peking signed an important trade agreement with Egypt in Aug. 1955.

During 1955 there were more than 16,000 mi. of railways in operation on the mainland. Nearly 500 mi. of railways were completed during 1955 and another 500 mi. were to be built by the end of 1955. The most important railway opened to traffic during 1955 was the Chinese section of the Tsining-Ulan Bator railway of about 200 mi. When the Mongolia section was finished, the direct rail route from Peking to Moscow would run through Ulan Bator, shortening the distance by about 600 mi. During 1955 there were about 86,000 mi. of highway in operation (66,700 mi. in 1953) including about 6,000 mi. of new roads built during 1949-54. Outstanding among the new roads were highways to Tibet.

Agricultural and Industrial Production.—According to official percentage figures, the combined total of industrial and agricultural output on the mainland in 1953 increased 14.4% over 1952, and the total value of industrial output for 1955 was expected to increase by 7.7% over 1954. Taking 1952 as 100, the 1954 production index figures for certain heavy industries, mostly state owned and operated, were: steel 165; pig iron 156; electricity 151; coal 126; oil 184; machinery 200; cement 161. The value light industry in 1954 produced three times that of 1949, and on the basis of 1949 production the 1954 output of cotton and flour industries increased by 300% and 200% respectively, and paper and sugar industries by 350% and 100% respectively. Under the five-year plan the target figures for major industrial products by 1957 as compared with 1952 were released in 1955 as follows: (1) steel, 4,120,000 tons against 1,350,000 tons; (2) electricity, 15,920,000 kw.hr. against 7,260,000 kw.hr.; (3) coal, 113,000,000 tons against 63,530,000 tons; (4) cement, 6,000,000 tons against 2,860,000 tons; (5) machine processed paper, 650,000 tons against 370,000 tons; (6) cotton piece goods, 163,720,000 bolts against 111,630,000 bolts; (7) machine processed sugar, 666,000 tons against 249,000 tons.

The 1954 agricultural production was said to be higher than that of 1953. The total value of agricultural output for 1955 was expected to increase 6.4% with grain output up 5.3%, cotton 20.6%, tobacco 38% and sugar cane 16%. The 1955 grain production was officially estimated at 180,000,000 tons. Under the five-year plan, grain production would reach 192,800,000 tons in 1972 or an increase of 17.6% as compared with 1952.

Chiropractic. Chiropractic is a system of therapeutics based on the premise that most malfunction and disease result from lack of normal nerve function. The doctrine

of chiropractic, by general manipulation and specific adjustment of the structures of the body and the use of clinical nutrition, physiotherapy and psychotherapy, as indicated, seeks to restore normal nerve function, thereby enabling the protective and restorative powers of the body to function normally.

The 60th anniversary convention of the National Chiropractic association was held in Atlantic City, N.J., July 4-8, 1955. The convention agenda included a series of scientific symposia covering important developments in diagnostic procedure, adjusting technique, X-ray interpretation, poliomyelitis, physiotherapeutic practices and public health problems. National councils on roentgenology, public health, physiotherapy, hospitals and sanitariums, psychotherapy, research, education and military chiropractors met at the same time. Minimum standards of four academic years, totalling 4,000 hrs., are required in the eight nonprofit colleges accredited by the National Council on Education. The 1956 convention was to be held at the Morrison hotel in Chicago, July 1-6. The second annual Chiropractic Conference on Polio was held in Chicago Nov. 1-5, 1955.

Mexico in 1955 granted licensing regulation to doctors of chiropractic.

A new sound motion picture, in colour, titled *How Do You Stand?*, depicting the relationship of posture, health and spinal hygiene, was released by the association for showing on television.

A series of full-page advertisements designed to inform editors throughout the United States that chiropractic is the second largest healing profession and is officially classified as one of the four major healing professions by the executive office of the president of the United States was published in six leading communications mediums.

Official publications are *Healthways Magazine*; the *Journal of the National Chiropractic Association*; the *National News*; *Chiropractic—A Career*. Headquarters: National building, Webster City, Ia. (L. M. R.)

Chou En-lai (1898-), Chinese Communist leader, was born at Hwaiyin in Kiangsu province. He studied at Waseda university in Japan and at Nankai university in Tientsin. In 1919 he led a student rebellion at Tientsin which led to his arrest and imprisonment. In 1924 he joined Sun Yat-sen's republican movement and was named director of political training at Whampoa Military academy, Canton. During Chiang Kai-shek's anti-Communist campaign of 1927 Chou was captured but escaped. He went to Moscow where he stayed from 1928 to about 1931, and served as a delegate to the sixth congress of the Russian Comintern. In 1936 he and Chiang buried their differences to form a united front against the invading Japanese. Their truce barely survived the end of World War II, at which time the Communists began their drive for control of all China. By 1949 they had practically achieved this aim, and Chou became prime minister and foreign minister of the new Central People's Republic of China. He signed the Sino-Soviet treaty of alliance and mutual aid at Moscow on Feb. 14, 1950.

Following the end of the Korean war in 1953 and particularly the end of the Indochinese conflict in 1954, Chou emerged as a political figure of world importance. At the Geneva (Switz.) conference on far eastern problems in April-July 1954, he demanded the withdrawal of all non-Asiatic powers from Asia. Returning to Geneva in July, he approved the final terms of the Indochinese truce between France and the Communist Vietminh, signed at Geneva, July 21.

Early in Jan. 1955 Chou received Dag Hammarskjöld, secretary general of the UN who had been delegated to ask China to free 11 U.S. fliers sentenced to prison for "espionage." At the Bandung (Indonesia) conference of Asiatic-African nations in

April Chou adopted a more conciliatory attitude toward the western nations, declaring that China was "friendly to the American people" and proposing that direct talks be held on outstanding Chinese-U.S. disputes. These talks began in semisecrecy at Geneva, Switz., on Aug. 1, 1955, between the U.S. ambassador to Czechoslovakia and the Chinese ambassador to Poland. The same day China announced the release of the 11 fliers. Two days before, Chou had proposed a collective peace pact between the U.S. and nations of the Pacific-Eastern Asia region.

Christian Science. Expanded use of radio and television broadcasting was a notable feature of activities of the Mother Church, the First Church of Christ, Scientist, in Boston, Mass., during 1955.

The new filmed television series "How Christian Science Heals" featured documented accounts of spiritual healing. Two guests told of their own religious experiences on each 15-min. program. A moderator gave brief comments of an inspirational nature, designed to show how everyone can rely on God's help effectively in problems of daily life.

Healings of cancer, alcoholism, asthma, migraine headaches, brain tumour, broken bones, spinal meningitis and other ailments were recounted by those who claimed they had experienced them. They also gave actual examples of how many other types of human problems—relations with others, business difficulties, character problems, and so forth—could be solved through spiritual understanding of God.

The denomination's radio programs, which also carry the series titled "How Christian Science Heals," were heard over about 800 radio stations in the United States, Canada, South America, South Africa and continental Europe. Testifiers on both radio and television programs included men and women from all walks of life from many parts of the world. More widespread acceptance of divine healing was reported during 1955 by many departments of the Mother Church.

Hundreds of insurance companies recognized the services of Christian Science practitioners, nurses and sanatoriums, during the year, it was reported. A growing number of companies added special Christian Science riders to their automobile, medical expense, health and accident, and general liability insurance contracts.

Continued growth in church membership was reported. As of the annual meeting in June, the Mother Church had 3,161 branch churches and societies in 46 countries.

Thirty-one new branches were recognized during the year. Included were those in Salzburg, Aus.; Upper Hut, N.Z.; Freemantle, Austr.; Aarhus, Den.; Kyoto, Jap.; Heidelberg, Ger.; and Caracas, Venez.

New translations of certain of the writings of Mary Baker Eddy, the discoverer and founder of Christian Science, into French, Greek and seven other languages were announced.

Circulation of the Christian Science periodicals and publications continued to rise during the year. New advertising records for the *Christian Science Monitor*, the denomination's international daily newspaper, were also announced.

During the year 17 Christian Science chaplains were on active duty with the armed forces of the United States in Austria, Japan, Korea and at major bases in the United States and on board navy ships. (W. B. Ds.)

Christian Unity. The negotiations of the last few years for a union of three American Presbyterian bodies came to a conclusion in 1955. Two of the bodies, the Presbyterian Church in the U.S.A. and the United Presbyterian Church of North America, recorded themselves as overwhelmingly in favour of the proposal. The third, however, the

Presbyterian Church in the U.S. (south), decided at its general assembly in Richmond, Va., June 2-7, 1955, that, in view of the failure of three-quarters of the presbyteries to approve, no further efforts in behalf of the union should be made at this time. The project for the three-way merger was therefore dropped for the present. The general assembly of the United Presbyterian Church, meeting in Monmouth, Ill., voted on June 15 to work toward union with the Presbyterian Church in the U.S.A. but no draft of a plan was put forth.

In the Lutheran circle two different projects were being considered. The most immediate of these was the plan for the union of the American Lutheran Church, the Evangelical Lutheran Church, the United Evangelical Lutheran Church and the Lutheran Free Church. If consummated, the result would be a denomination of about 1,800,000 members. All of the bodies had accepted the plan except the Lutheran Free Church. Since the Lutheran Free Church is congregational in its form of government, final ratification waited on a referendum which was under way in the local churches in the latter part of 1955. An affirmative vote by three-fourths of the congregations was required. In voting to conduct the referendum the annual (1955) conference of the Lutheran Free Church stipulated, as a condition of joining the merger, that the Augsburg college and seminary (both in Minneapolis, Minn.) should continue under the control of its congregations.

A more inclusive proposal for Lutheran union registered progress when the Augustana Lutheran Church in its annual synod in St. Paul, Minn., June 14-19, voted to join with the United Lutheran Church in America in extending an invitation to all Lutheran bodies to enter into discussions concerning union. The synod also authorized its commission on ecumenical relations to begin negotiations with the United Lutheran Church and any other bodies that might accept the invitation. Another Lutheran body, the American Evangelical Lutheran Church (which is of Danish background), at its annual convention in Kimballton, Ia., in August voted to participate in these discussions. It took this action after rejecting an earlier proposal to become a constituent linguistic synod of the United Lutheran Church in America.

The proposed union between the Congregational Christian Churches and the Evangelical and Reformed Church moved a long step ahead. After a long delay resulting from legal action in the courts by opponents of the plan, official conversations between the two denominations were reopened. Decisions were made by both groups to consummate the merger on June 25, 1957. The name of the new body, which would have 2,000,000 members, was to be the United Church of Christ.

Two groups of Friends (Quakers) completed a union which had long been in process, the Religious Society of Friends of Philadelphia and Vicinity (Arch Street Meeting) and the Philadelphia Yearly Meeting of the Religious Society of Friends (Race Street Meeting). The name of the combined unit is the Philadelphia Yearly Meeting of the Religious Society of Friends.

The plans for eventual union of the Unitarians and the Universalists moved forward slowly. The American Unitarian association at its annual meeting in Boston in May voted to take "more time" to study the matter in the local churches. The two denominations formed a Council of Liberal Churches in 1953, which federated their departments of religious education and public relations and was expected to be a first step toward a fuller union.

A commission of 12 members, 6 from each denomination, was appointed at the meeting of the council in Aug. 1955 to propose concrete plans for a merger.

In Canada the discussions between the United Church of Canada (made up of Methodists, Congregationalists and Pres-

byterians) and the Anglican Church in Canada were somewhat revived, after a period of inaction, by a vote of the general synod of the latter body in September calling for "continuing conversations" with the United Church of Canada and other Christian groups in the dominion.

In Great Britain the chief development was the action of the Anglican church assembly, in London in July, in widening the degree of intercommunion between the Church of England and the Church of South India. The Church of South India, formed in 1947, represented the most advanced outpost of church unity thus far. Anglican, Methodist, Presbyterian, Reformed and Congregational groups joined in bringing it into being. The question of relations between the united body and the Church of England had been a matter of much debate, because the ministry of the Church of South India during its early years included men not episcopally ordained, though with an agreement that after the first generation all clergy should be episcopally ordained. The Anglican church assembly decided that any bishop or ordained presbyter of the Church of South India might celebrate Holy Communion in a parish of the Church of England at the invitation of the rector, with the permission of the bishop of the diocese. Communicants of the Church of South India were authorized to receive Communion, when they were in England, in the Church of England.

In addition to this step in relation to the Church of South India, the Anglican church assembly voted to seek closer relations with the Methodist Church, looking toward the possibility of eventual union. The resolution called specifically for the opening of conversations only with the Methodists, but the archbishop of Canterbury stated that the Church of England was ready to engage in similar discussion with any of the other free churches desiring it. The Anglican proposal was promptly welcomed by the Methodist general conference which was in session at the same time.

In north India and Pakistan, where hopeful negotiations for a united church which would include Anglicans, Baptists, Methodists, Presbyterians and Congregationalists had long been in process, a setback was experienced. The committee representing the five denominations voted to delay final decision for "five or six years."

Questions were raised (from the Anglican side) about proposed arrangements for unifying the various ministries. Other questions were raised (from the Baptist side) about the proposal to make infant baptism and believer's baptism alternative practices. Apparently the recommendation that these questions be studied further meant that there was no prospect of a consummation of the union before 1960 at the earliest.

In Ceylon a plan for union among Anglican, Methodist, Presbyterian and Baptist bodies was receiving favourable attention. It provided for optional modes of baptism and solved the problem of the ministry by proposing that the newly elected bishop would lay hands on all the ministers but without implying a denial of the validity of previous ordination.

In various areas several other projects of union were being considered with more or less seriousness but no early achievements were in sight.

The movements herein described all contemplate actual union of separated churches. In the wider fields of co-operation between churches much greater progress was evident. New councils of churches, both national and local, were formed. Existing councils found their support strengthened. The World Council of Churches, following its second assembly (held in Evanston, Ill., in Aug. 1954) reorganized its work in three divisions of operations: the division of interchurch aid and service to refugees, the division of studies and the division of ecumenical action.

Chronology: see CALENDAR OF EVENTS, 1955, pages 1-16.

Churches of Christ. Churches of Christ continued to grow rapidly during 1955 with an estimated increase of 500 churches in the United States alone. Since these churches are strictly congregational in government, it is difficult to obtain exact figures on growth. The published estimates gave a United States membership of 1,600,000 in 15,000 churches. Contributions during the year were estimated at \$45,000,000 for all causes. These churches have no denominational organization or headquarters since they are composed of members who are pleading for undenominational Christianity.

In 1955 increased emphasis was placed on Sunday Bible study and approximately 10% more people began attending during the year. The year marked an increase in mission work in the United States and abroad. About 120 workers were being supported in 50 other nations by churches in America. A nationwide broadcast, *Herald of Truth*, was started in 1952 and grew to about 300 stations with an estimated 3,000,000 listeners weekly. This program was being produced by the Highland Church of Abilene, Tex., with other churches assisting voluntarily.

Individual members of the church organized a nonprofit corporation, Gospel Press, in Dallas, Tex., during 1955 and the first advertising in national magazines was scheduled to begin in Nov. 1955.

Fifteen orphanages and homes for the aged were supported by the churches during the year. The Broadway Church of Christ in Lubbock, Tex., began a new home for homeless children, the Children's Home of Lubbock, in 1953. In 1955 it completed its fourth cottage and was caring for 54 children.

Members were also supporting 18 Christian schools and colleges. Abilene Christian college at Abilene, Tex., celebrated its 50th anniversary in the 1955-56 school year. A new college was organized at York, Neb., to begin operations in 1956. Other new schools were being planned for Lubbock, Tex.; Philadelphia, Pa.; and Indiana. (M. N. Y.)

Churchill, Sir Winston Leonard Spencer

(1874-), British statesman, was born at Blenheim palace, Oxfordshire, Nov. 30. For his biography, see *Encyclopædia Britannica*. In April 1953 he was invested K.G. by Queen Elizabeth II. The following December he represented Great Britain at the three-power conference with the United States and France held at Bermuda. In an effort to ease world tension he flew to Washington, D.C., in June 1954 with Anthony Eden for talks with Pres. Dwight D. Eisenhower and John Foster Dulles which led to a joint declaration of principles, known as the Potomac statement. His 80th birthday celebrations in November included presentations to him by the queen, parliament and the public.

On Jan. 31, 1955, Sir Winston Churchill opened the commonwealth prime ministers' conference in London. Speculation about his retirement reached its peak on April 4 when he entertained Queen Elizabeth and the duke of Edinburgh at dinner at 10 Downing street. The following afternoon he tendered his resignation to the queen at Buckingham palace. He left for Chartwell on April 6 and was not present in parliament when tributes were paid to him by members as one of the greatest prime ministers and the last survivor of those who had served in the house under Queen Victoria. Sir Anthony Eden, his suc-

cessor, spoke of his outstanding faculty of seeing problems in terms of human values rather than as abstract concepts.

On April 12 Churchill arrived in Syracuse, Sicily, for his first holiday as a private person since he had assumed office in 1939. In the general election of May 26 he was re-elected M.P. for Woodford.

Several statues and paintings of Churchill were unveiled during the year. On May 4 a bust of him, purchased by national subscription, was unveiled in Copenhagen, Den., during Danish May day celebrations. A statue by Oscar Nemon commissioned by the court of common council was unveiled at Guildhall on June 21 in his presence, and on Sept. 7 he attended the meeting of the Court of Brotherhood and Guestling at Hastings, Sussex, at which he was presented with a portrait of himself as warden of the Cinque Ports. On Sept. 15, with Lady Churchill, he left London for a holiday in southern France, and he did not return to attend the Conservative party conference in October.

Church Membership. The latest information in 1955 concerning church membership in 255 religious bodies in continental United States, appearing in the *Yearbook of American Churches for 1956* (New York, 1955), indicated that there were 97,482,611 persons in 300,056 local churches or congregations. The figures were mainly for years ending in 1954. This compared with 94,842,845 members reported in the *Yearbook* a year earlier. There were 81 religious bodies reporting more than 50,000 members each (see Table I), and their total membership was 95,957,565, or more than 98% of all members of religious bodies.

The remaining 2% were found in about 175 smaller bodies of the nation.

Church membership, officially reported, had been increasing for many years, as had also the proportion of church membership in the total population. In 1954 church members were about 60.3% of the population. Since 1926, the date of the last adequate census of religious bodies made by the bureau of the census, church membership had increased more than 80%, while the estimated population increased about 40%.

However, nothing was known about church attendance or other participation, or the proportion of church members con-

tributing money.

The Church of Christ, Scientist, does not report membership because of a regulation of that body which forbids the numbering of the people and the reporting of such statistics for publication.

In 1954 about 58% of church members in the U.S. were classified as Protestant, 33% Roman Catholic, 6% in Jewish congregations and 3% in all other bodies including Eastern Orthodox and Old Catholic. (B. Y. L.)

Principal Religions of the World.—Most religions, apart from Christianity, do not keep even approximate statistics for their membership. For the first time Table II has depended upon a Moslem estimate for their membership. Oriental religions generally are not exclusive in their demands upon their followers, so they sometimes give allegiance not to one only but to two, or even more. Obviously, therefore, these figures are for the most part only estimates.

Protestant Christianity is the only group that counts on those who "join" the church, as distinguished from Roman Catholicism which numbers all who have been baptized by the church. (C. S. B.)

Civil Aeronautics Administration.

In the fiscal year ending June 30, 1955, commercial aviation in the United States showed marked gains over the previous fiscal year in almost all categories.

Scheduled Operations.—Revenue passenger-miles flown by domestic scheduled carriers increased 17%, from 15,600,000,000 in fiscal 1954 to 18,300,000,000 in 1955. Revenue passenger-miles flown by international scheduled carriers also increased 17% in this same period, from 3,500,000,000 in 1954 to 4,100,000,000 in 1955.

In 1955, the domestic scheduled carriers showed an increase of 16% in ton-miles of express carried, a decrease of 3% in ton-miles of freight carried, and an increase of almost 10% in ton-miles of U.S. mail, compared with 1954. In international operations, for the same period, express and freight ton-miles increased nearly 4%, while mail ton-miles increased 60%.

A total of 4,232 aircraft were manufactured in fiscal 1955 compared with 3,685 in fiscal 1954, an increase of nearly 15%. There was an increase in the dollar value of the aircraft manufactured, 57%, from \$35,326,000 in 1954 to \$55,686,000 in 1955. (S. AIRCRAFT MANUFACTURE.)

Airports.—During the fiscal year ending June 30, 1955, airports totalling \$22,245,200 were made to 192 airports under the Federal-Aid Airport program. The program announced for the year starting July 1, 1955, involved a total of 205 grants, amounting to an allocation of \$20,000,000, which would result in a total expenditure of approximately \$40,000,000 by the federal government and local communities.

An additional authorization of \$42,500,000 for the fiscal year was included in the

amendment to the Federal Airport act approved by the president on Aug. 3. Programming of this money was expected to be completed by the end of 1955. The new law further authorized a level of \$63,000,000 for federal grants for each of the following three fiscal years, which would enable sponsors to present long-range airport plans and permit earlier programming of each fiscal year's authorization.

Airways and Air Traffic Control.—During the year ending June 30, 1955, the length of "Victor" airways, those based on the use of very-high-frequency omnidirectional radio ranges (VOR or omniranges) was increased 12,000 mi. to 74,000 statute miles of primary airway, and alternate "Victor" airways were increased 2,800 mi. to 25,000 statute miles.

A total of 27 new omniranges, ten instrument landing systems, five airport surveillance radars, and 64 distance measuring equipment facilities were installed during the year. A long-range surveillance radar commissioned at New York covered a radius of about 100 mi.

The increased use of direct radio communications between pilots and controller personnel in air route traffic control centres, and of radar as a traffic control tool, further expedited the handling of arriving and departing aircraft. Two additional military/civil radar approach control centres were commissioned, making a total of 3 in a program of 18.

Aircraft Developments.—Expansion of the scheduled air carrier industry continued during the year. The Vickers Viscount, of British manufacture, was the first turboprop powered aircraft to be used in United States scheduled service. Viscounts began scheduled runs between Washington, D.C., and Chicago, Ill., and Washington, D.C., and Norfolk, Va., on July 26. New larger and faster aircraft such as the Douglas DC-7 and the Lockheed Super Constellation were delivered to replace older and obsolete equipment.

Important Court Decision.—Perhaps the most important legal decision during the year which affected aviation was in the Cedarhurst case, in which the validity of government regulations was upheld on the basis that congress pre-empted the airspace necessary for the flight of aircraft. An ordinance of the Village of Cedarhurst, N.Y., restricting low-altitude approaches to New York International airport, was voided as being in conflict with the paramount federal authority to regulate minimum flight altitudes.

Technical Developments.—The Cincinnati Air Route Traffic Control centre was moved to Indianapolis, Ind., to complete the installation phase of the Airways Operations Evaluation centre. This side-by-side arrangement of an operating and experimental centre permitted the evaluation and implementation of new air traffic control procedures and equipment on a more expeditious basis.

The centre's analyzer for determining the effectiveness of an aircraft fire extinguishing system in flight was applied to the B-36 aeroplane with satisfactory results. Facilities were erected at the centre for the conduct of full-scale fire tests on helicopters and for the investigation of explosion hazards associated with jet engine installations.

Publications.—Three important studies were published during the year. "The Airplane at Work for Business and Industry" presented statistical data on all civil flying except that performed by the scheduled airlines. "Federal Airways Air Traffic Activity Calendar Year 1954" gave basic statistics on the operations of the federal airways system. "Air Commerce Traffic Pattern Calendar Year 1954" covered the actual aircraft departures from each scheduled air carrier station in continental and territorial United States and the loads put aboard the aircraft at the station during the year.

International Technical Assistance.—During the 1955 fiscal

year, 20 Foreign Operations Administration/Civil Aeronautics Administration missions and groups with a total personnel of 56 specialists were operating or scheduled to begin operations in 19 countries. An average of 110 foreign nationals representing approximately 25 foreign countries receive specialized aeronautical training each year in the United States. The CAA had been authorized to purchase aeronautical ground facilities amounting to \$4,662,000 for eight countries in Europe, the near east and Asia, under the Foreign Operations administration (now the International Cooperation administration) program. (See also AVIATION, CIVIL.) (B. M. St.)

Civil Defense, U.S. The Federal Civil Defense administration has the responsibility "to provide an orderly and continuing means of assistance by the Federal Government to States and local governments in carrying out their responsibilities to alleviate suffering from major disasters" of any kind.

During 1955, in planning for 1956, the Federal Civil Defense administration (FCDA) assumed that: (1) potential enemies had and were capable of delivering on targets thermonuclear weapons with the destructive power of millions of tons of T.N.T.; (2) the most logical targets continued to be from 90 to 100 U.S. cities holding industrial and military concentrations in 70 critical target areas; (3) any or many of these targets could be largely destroyed with a single weapon; (4) ground bursts of multimillion-ton weapons, creating enormous clouds of radioactive material that would fall back to earth in lethal concentrations over thousands of square miles, would make the entire nation vulnerable; but (5) an effective defense to save millions of lives was possible.

Such a defense would require the efficient practice of these techniques: (1) evacuation of critical target cities, moving populations outside a circle 12 to 15 mi. from any presumed aiming point; (2) shelter for all those evacuated and for all who were embraced by the cigar-shaped area of radioactive fall-out down wind from a ground burst; (3) care and feeding for all dispersed individuals in predetermined reception areas; and (4) full rescue, support and recovery efforts by all areas remaining unaffected by bomb blast, fire and fall-out.

Tests conducted in many cities had shown that evacuation, first key to survival, was feasible even with the one-hour aerial attack warning time that was likely. Increased warning time of four to six hours, expected to be achieved with completion of the upper trans-Canada Distant Early Warning radar picket line, would greatly increase the percentage of the population that could be saved in any city.

Older and more familiar defense tactics could be employed against the chemical and biological warfare that might be expected to supplement atomic attack.

Civil Defense in 1955.—FCDA's release in 1954 of the film *Operation Ivy*, revealing the awesome power of the hydrogen bomb, was followed on Feb. 15, 1955, by the Atomic Energy commission's disclosure that fall-out from this detonation covered an area of 7,000 sq.mi. The defense problem of 70 critical target areas at once became a problem for the whole nation since the patterns of fall-out from high-yield ground bursts, determined solely by the direction and velocity of upper-air winds, are unpredictable.

During Operation "Alert 1955," the second continental defense exercise (June 15-17), when more than 50 mainland cities were presumed to have been hit by bombs ranging in power from 20,000 to 5,000,000 tons of T.N.T. equivalent, fall-out patterns were long fingers of disaster, probing far from the cities.

Operating cadres of 31 key government agencies moved to relocation sites from 30 to 300 mi. from Washington, D.C., at

Above: TWO ASPECTS of the nation-wide mock atomic alert, June 15, 1955. Left, Herald square, New York city, in the heart of the shopping district, virtually deserted after the alarm had sounded; right, Pres. Eisenhower (second from left, seated) and members of the cabinet in a secret retreat near Washington, D.C., after an "evacuation" of the nation's capital

Above: RADAR ISLAND being towed out of Boston, Mass., harbour to a point about 100 mi. off the New England coast where it was to be permanently anchored to serve as a station in the continental defense system

Left, and below: THREE VIEWS of a small bomb shelter manufactured by a U.S. manufacturing firm in 1955. Left, lowering shelter into hole prepared for it. A platform about 10 X 22 ft. was required for the shelter; below, left, a youngster being helped into entrance hatch; below, right, interior view. The shelter was designed to maintain a family for three to five days. The $\frac{3}{4}$ -in. steel would protect against both blast and radiation. Facilities included a gasoline generator, chemical toilet, air filter for removing radioactive particles, first aid supplies and food

the first "attack" warning. The government functioned. Some "target cities" held partial or theoretical evacuations. Exercise evaluations indicated that 8,500,000 persons would have died in such an attack, but 2,500,000 would have been saved from the few cities ordering evacuation. Another 8,000,000 would have been fatally stricken, many by radiation.

Congress subsequently appropriated \$10,000,000 to FCDA to begin survival studies of critical target cities and their environs. These were to determine evacuation feasibility, corrective construction necessary to speed evacuation, relocation sites, shelter availability and related subjects.

The first cities for study were selected in mid-September and in mid-October it was announced that evacuation of Washington, D.C., would be mandatory on warning of probable attack.

Natural Disasters, 1955.—Local civil defense volunteer organizations were increasingly called upon to deal with widely varied emergencies, and uncounted lives were saved. But property damage, public and private, was unusually heavy.

During 1953 and 1954, under 32 declarations of major disasters by the president, FCDA had allocated \$12,680,000 to 24 states and 1 territory from the president's emergency fund of \$25,000,000. Disasters were caused by hurricanes, tornadoes, floods, earthquakes, forest fires and a volcanic eruption. Drought and dust bowl relief, separately financed, required \$28,000,000 in 20 states and 1 territory. During 1955 this increased to \$35,000,000.

In the first half of 1955, for the emergency repair of public facilities, four states and a territory were allocated \$821,000 in disasters caused by tornado, flood and cloudburst.

In August two hurricanes lashed the middle Atlantic coast and New England, and resulting flood damage was expected to approximate \$500,000,000.

FCDA allotted \$6,500,000 of its dwindling funds and, under its natural disaster responsibilities, brought a score of federal agencies into an all-out relief and rehabilitation program, with total U.S. aid expenditures expected to approach \$100,000,000. Worst hurt states were Connecticut, Massachusetts, Rhode Island, Pennsylvania, New York, New Jersey and North Carolina.

With rehabilitation in progress, disastrous flooding was repeated in early October, nullifying much of the work that had been done and greatly increasing total damage to public facilities and private properties.

Administration.—FCDA's 1956 fiscal year appropriation, in addition to the special Survival Study fund, was divided: \$12,125,000 for operations, \$12,400,000 for contributions (matching funds with states), \$32,650,000 for stockpiling of emergency supplies and equipment and \$1,005,000 for financing delegations to other departments.

Val Peterson, former governor of Nebraska, was administrator of FCDA, which has its national headquarters in Battle Creek, Mich. (See also CIVIL AERONAUTICS ADMINISTRATION; MUNICIPAL GOVERNMENT.) (V. PN.)

Civil Rights: see LAW; NEGROES, AMERICAN.

Civil Service. **United States.**—When the administration of Pres. Dwight D. Eisenhower took office in Jan. 1953, there were approximately 2,600,000 federal employees. During the first year the number was reduced by about 180,000 and by June 30, 1954, the federal government employed 2,346,000 persons. On June 30, 1955, the total employment was 2,397,000.

A large number of bills were passed by the 84th congress which benefited federal employees. Late in June, President Eisenhower signed a pay raise bill for classified employees which

gave each an increase of at least 7.5%. Another bill gave an average pay increase of 8.1% to the nation's 500,000 postal employees. Federal departments were given discretion to raise the maximum travel allowance for employees from \$9 to \$12 per day. Approximately 300,000 civil service retirees and survivors were given increases on 12% of the first \$1,500 and 8% on the annuity in excess of \$1,500. A ceiling of \$4,104 was written into the bill so that no payment could be made to raise an annuity above that figure. Congress provided that the government pay all costs of surety bonds for employees required to be bonded. In 1954 congress passed a group-insurance plan for federal employees. In 1955 a bill authorized the government to take over an estimated 135,000 life insurance policies which were issued by nonprofit employee beneficial associations. The associations must go out of the life insurance business and the policyholders must continue to pay premiums, but to the government. On July 1, the civil service commission cancelled all maximum age requirements in examination announcements in accordance with a rider on the bill authorizing the commission's appropriation for 1956.

Two important court decisions were made in 1955 that involved the federal loyalty-security program. On June 6, the supreme court ruled 7 to 2 that the loyalty review board had exceeded its authority in reopening the case against John P. Peters after he had been cleared twice by agency loyalty boards. Peters was a part-time consultant with the public health service. The case was argued on the constitutionality of testimony by unnamed or secret informers and both sides urged the supreme court to rule on that point. The court, however, held in favour of Peters on other grounds. Because these and other unsettled problems continued to arise concerning the operation of the security system, the senate government operations committee on June 17 unanimously approved a resolution calling for a 12-member commission to investigate the security program. The commission was to report to congress by Dec. 31, 1956.

The U.S. court of appeals in Washington, D.C., upheld by a 2-to-1 decision a 1953 presidential order which extended the security program to all federal jobs. The order permits government agencies to dismiss summarily any employee when a security issue is involved. The court concluded that the basic law authorizing the security program makes no distinction between sensitive or policy-making jobs and other jobs.

The Commission on Organization of the Executive Branch of the Government, established in July 1953 (popularly known as the Second Hoover commission) transmitted its report with respect to federal personnel activities and policies in mid-February.

The report declared that the greatest weakness in government was the need for improved expert management. Some recommendations made to overcome this problem were: the establishment of a "senior civil service"; creation of more noncareer executives to take over political and partisan jobs; modification of layoff procedures to give more job retention rights to nonveteran career employees; limiting appeal rights of veterans after five years; establishment of comprehensive training programs; abolition of present performance rating system and substitution of once-a-year reports for only those employees who are doing exceptional work or unsatisfactory work; salary increases for top executives; more use of prevailing wages in setting pay; codification of laws and rules affecting personnel; development of new criteria for determining which jobs are policy making; review of "conflict of interest" regulations; extension of merit system to cover U.S. marshals and some other positions; and changes in classification of certain positions.

State and Local.—State and local governments had a total of 4,774,000 employees in April 1955, compared with 4,735,000

in April 1954. This increase, however, was not as great as the growth in all other years since World War II. For several years the increase had been at the rate of about 200,000 per year.

No significant civil service legislation was passed by U.S. cities in 1955, but two states revamped their personnel programs and three passed important amendments. The Illinois personnel code, which would become effective July 1, 1957, created a personnel department of cabinet rank headed by a personnel director appointed by the governor and confirmed by the senate. Assisting the personnel director would be a bi-partisan advisory board of nine members and a civil service commission of three members. An unusual feature of the Illinois law was that there would be three separate areas of jurisdiction, under which, for example, it would be possible for a position to be under the personnel department for purposes of classification, pay and working conditions but not for purposes of hiring or dismissal.

Florida provided a statutory basis for the existing merit system council which had been operating on the basis of a mutual agreement between the state departments participating in the grant-in-aid programs administered in co-operation with the federal government's department of health, education and welfare. The same act also gave the governor power to extend the jurisdiction of the merit system council to other state departments. It therefore became possible for a state-wide personnel system to be established at any time in the future.

In New York, the civil service commission was given the power to direct the reinstatement of an employee to his former position if it finds he was improperly dismissed. In Minnesota, the state personnel director would still be appointed by the civil service commission from a list of three to five names submitted by a special examining committee, but the appointment would be subject to confirmation by the senate and would be for a term of six years instead of providing permanent status. After that he might be reappointed by the commission and reaffirmed by the senate. California removed from the civil service law the provision that when the state personnel board is considering an appeal by an employee from a disciplinary action "it shall be a presumption that the statement of the causes (for the action) is true." Pressure was brought by employee organizations for this change on the ground that it violated the American attitude that a person is presumed innocent until proved guilty. (E. R. BN.)

Great Britain.—On Oct. 1, 1955, there were 636,098 non-industrial civil servants, as compared with 638,176 a year previously.

Negotiations on the National Whitley council, initiated with the approval of the chancellor of the exchequer, led to an agreed scheme for the gradual introduction of equal pay for nonindustrial staff. Women doing equal work under equal conditions with men would have their rates of pay brought up to the men's level by seven equal annual instalments. For typists and certain analogous grades the new common rates of pay, on which men would in the future be recruited and which women would ultimately obtain, were slightly lower than the men's present rates. The scheme was put into force on Jan. 1, 1955. Nonindustrial staff would therefore obtain full equal pay by Jan. 1, 1961. Arrangements for the recruitment of clerical staff were modified to include provision for the recruitment to permanent posts of men and women between 40 and 60 years of age. This was significant of the changes of recruitment policy called for by full employment and the changing age structure of the population. (See also GOVERNMENT DEPARTMENTS AND BUREAUS, U.S.)

(E. E. Bs.)

Civitan International: see SOCIETIES AND ASSOCIATIONS, U.S.

Cleveland. Cleveland, O., had a population of 914,808 in the federal census of 1950. Cuyahoga county which includes the city and most of its suburbs, had a population of 1,389,532. The county's estimated population 1954 was 1,509,000.

Mayor Anthony J. Celebrezze, first man of foreign birth to be elected to that office, clinched re-election in the Oct. 4, 1955 nonpartisan mayoralty and councilmanic primary when he polled more votes than all of the other four candidates combined. Under a city charter amendment adopted two years earlier when a mayoralty or councilmanic candidate obtains more than 50% of the total primary vote, only his name is printed on the ballot in the November election. Mayor Celebrezze, an independent Democrat, received 55.7% of the primary vote; State Senator Joseph W. Bartunek, the regular Democratic organization candidate, 20.1%; City Councilman Kermit K. Neely, Republican organization candidate, 13.1%; Alexander H. Marti Jr., an independent Democrat and first Negro candidate for mayor in the city's history, 8%; and former assistant Law Director Robert E. Sweeney, independent Democrat, 3.1%.

The city's \$8,000,000 port development bond issue, which would enable it to prepare for the additional maritime traffic expected with the opening of the St. Lawrence seaway, was approved by the voters in the November election. So was Cuyahoga county's \$10,000,000 highway issue which would open the way for a new county highway and elimination of four railroad grade crossings. Democrats won 22 seats in city council to the Republicans' 11. The city's long-planned rapid transit system came into being in 1955. The east side section was opened March 15 and the west side section began operations Aug. 1. Built at a cost of more than \$30,000,000, the electric transit line extends 13.3 mi. from Windermere station in East Cleveland to Madison Avenue and W. 117th street. A two-mile westerly extension to Lorain Avenue and W. 143d street was approved by the Cleveland Transit System board. Fare increases on other transit lines were increased July 23.

After voters disapproved an operating levy at the Nov. 1954 election, Cleveland's budget for 1955 was cut to \$42,997,270. Revenue in 1955 exceeded estimates by more than \$1,000,000. The city administration was able to increase its spending to little more than \$44,000,000. With city employees demanding wage and salary increases and other costs rising, Mayor Celebrezze in July appointed a 25-member committee headed by Birkett L. Williams to recommend a solution to the city's financial dilemma. This committee reported in November, recommending that a 1.5-mill real estate tax increase be submitted to the voters at a special election; that no city income tax be considered; that fees for various city inspections and services be raised; that relief payments be limited; and that the administrative management of certain city departments be reviewed to make sure that maximum efficiency is maintained.

A 10-year program for expansion of the size of the Cleveland Hopkins airport neared its end as the city council approved legislation to condemn 15 parcels of land, the last of 600 needed. Construction of an \$8,000,000 terminal building was nearing completion. (P. By.)

Climate: see METEOROLOGY.

Clothing Industry. The apparel industry in the United States maintained its relative importance in the country's economy during 1954 and 1955. Approximately 900,000 workers were employed (80% women) in factories located mostly east of the Mississippi river.

Men's and Boys' Apparel.—As a whole, production of men's apparel declined approximately 10% in 1954 as compared

with 1953. This decline was noticeable in all items of men's apparel, such as suits, coats, shirts and work clothes. Only in slacks (separate pants) was production maintained in 1954 at approximately the same level as in 1953.

In 1955, however, there was a sharp reversal in the trend, and production in all categories of men's apparel increased approximately 15% as compared with 1954.

Table I.—U.S. Apparel Industry Sales, 1954, at Wholesale Prices

Type of clothing	Number of Firms	Total sales
Men's and boys' tailored clothing	1,037	\$1,416,000,000
Men's furnishings and work clothes	980	1,572,000,000
Sports outerwear and rain outerwear	414	377,000,000
Women's wear		
Dresses	3,544	2,900,000,000
Coats and suits	1,350	1,250,000,000
Intimate apparel	1,144	1,100,000,000
Total	8,469	\$8,615,000,000

Because of the huge increase in the birth rate during the post-war years, the boys' apparel industry had shown a remarkable upsurge in demand (up to 30% in the smaller sizes), and it was expected that this increasing demand would grow to include students' sizes and finally to reach the college age.

Stylewise, at the end of 1954 there was a definite trend toward dark shades, particularly charcoal tones; in the first half of 1955 about 75% or more of the men's and boys' clothing sold was in the darker shades rather than light or medium colours. Toward the end of the year, however, there was some return to medium and light grays and tans. Conservative models were in greatest demand during 1955, the single-breasted suit being popular in both men's and boys' sizes.

Sportswear was conservative in type of garment and in colour. The tailored sport coat was being worn in preference to the loose leisure jacket. Slacks continued to grow in popularity, and it was estimated that approximately 55,000,000 separate trousers would be made in 1955.

There was growing use of the man-made fibres blended with other materials, such as Dacron and wool, Orlon and wool, Dacron and rayon. Suits and coats made of some of these combinations could be washed rather than dry cleaned; the number of "wash and wear" garments was small but increasing.

In 1955 dress shirts (long sleeves) represented approximately one-third of total shirt production, and sport shirts (short sleeves) constituted the balance. This was in accordance with the general trend throughout the apparel industry toward less formal garments.

Women's Wear.—In the women's wear industry, the same trend noted in the men's wear industry, namely, increased popularity of informal items of apparel, was noticeable during 1954 and the first half of 1955. Production of women's coats declined approximately 5% in 1954, as compared with 1953. Women's dresses of all types maintained approximately the same rate of production in 1954 as in 1953. Of particular interest, however, was the fact that cotton fabrics assumed increasing importance

Table II.—Women's Apparel—Value of Shipments in Selected Industries

Industry	First half 1955	First half 1954
Total, selected industries	\$1,527,000,000	\$1,419,000,000
Coat and suit industry	353,000,000	345,000,000
Unit-price dress industry	698,000,000	642,000,000
Dozen-price dress industry	202,000,000	196,000,000
Blouse industry	168,000,000	150,000,000
Skirt industry	106,000,000	86,000,000

in the women's dress field, and that dresses of man-made fibres declined in relative importance.

Skirts and blouses, especially blouses made of cotton fabrics, increased in popularity in 1954 as items of informal wear. Women's suits in wool and blended fibres were popular, but the suits made of all rayons declined in importance.

TOUAREGS OF THE SAHARA DESERT clutching at the dress of a fashion model in Paris, Fr. The tribesmen and their wives, given a trip to Paris after assisting in the filming of a motion picture in Africa, had never before been away from the desert

For the first half of 1955, as compared with the corresponding period of 1954, production of all categories of women's apparel except coats increased to higher levels. This was in accordance with the trend already noted that more informal garments, such as suits, dresses, blouses and skirts, were increasing in popularity.

Labour.—Labour relations between management and the two unions dominating the apparel industry in the United States continued on a satisfactory basis. Over a period of years, the employers in the women's wear field had established an amicable arrangement with the International Ladies' Garment Workers' union, and strikes had been almost nonexistent in this industry.

The Clothing Manufacturers Association of the U.S.A. (covering men's and boys' clothing) had a long-term labour agreement with the Amalgamated Clothing Workers of America, and both had conducted their labour negotiations on a national basis to their mutual satisfaction. (H. A. CN.)

Coal. The 19 countries producing about 98% of total world output in 1954 (as in 1953) are shown individually in Table I, compiled from data at the U.S. bureau of mines. Four of these countries supplied 54%. The 1954 output was 7,000,000 tons under that of 1953 but was still the highest of the rest of the decade.

United States.—Details of the coal industry in the United States, given in Table II and state totals in Table III, also are based on U.S. bureau of mines data. Outputs of both anthracite and bituminous coal declined further in 1954 from 1953. Open-pit mining in the anthracite field increased percentage-wise in 1954, but exact figures were not available by the close of 1955.

In the first nine months of 1955 output of anthracite declined about 7.9% and bituminous increased about 20%, compared

*Revised. †Preliminary.

with the first nine months of 1954. One reason for the great difference in the bituminous outputs was that 1954 was so low compared with 1953 and earlier years—back to 1938, the lowest figure in years. Also steel strikes and other industrial strikes in 1954 pulled it down. Moreover, overseas exports (excluding Canada) were also down. In 1955, industrial activity picked up and this increased the demand for coal. Even 1955 overseas exports increased 15,000,000 tons in the first nine months of 1955 compared with the 1954 period.

In 1955, the state legislature of Pennsylvania and the U.S. congress passed bills appropriating \$8,500,000 each, or a total of \$17,000,000, to be used to alleviate serious water problems of the Pennsylvania anthracite industry. (F. E. H.; B. B. M.)

Coast and Geodetic Survey, U.S. During 1955 this bureau of the department of commerce continued its surveying and charting

program in the United States and Alaska for the promotion of marine and air commerce, for the development of the nation's natural resources and for the compilation of certain basic engineering and scientific data. The bureau is under the administrative direction of a director, an assistant director, and an assistant director for administration, with headquarters at Washington, D.C. District offices are maintained at a number of coastal ports and at several interior cities in order that close contact may be had with the needs of commerce and industry. Survey functions are performed by a field organization operating from ships and shore bases, under the direction of the Washington office where computation and analysis of field observations are made and the results compiled in the form of charts and other publications.

Seventeen ships and two shore-based parties were engaged along the coasts of the U.S. and Alaska during 1955, making basic hydrographic surveys and obtaining other information essential for the production of nautical charts. A new survey of the Gulf of Maine was begun. The application of electronics to hydrographic surveying had greatly increased the accuracy of the results and the efficiency of operations. A maximum distance of 550 statute miles from shore had been attained.

The photogrammetric mapping program of the bureau is designed to provide data for aeronautical charts, including charts of airports, and for the construction and maintenance of nautical charts. Basic photogrammetric mapping was continued in the U.S. and Alaska, and chart revision photography was taken in sections of the Atlantic coast, and of a number of harbors along the Gulf and Pacific coasts. As part of the airport obstruction plan program, 40 airports were photographed for compilation of new plans and for the revision of existing ones.

A chain of control tide stations was maintained at selected places along the coasts to provide the fundamental observations for tide predictions, for charting and mapping, and for other engineering uses, such as the study of long-period changes in sea level. Special reports on tide surveys of San Francisco bay, Delaware bay, and Puget sound were completed. Analysis of data and preparation of reports on surveys of currents at New London, Portsmouth harbour, Delaware bay, Key West harbour, Puget sound, and San Francisco bay were completed.

The geodetic networks of control in the U.S. and Alaska were expanded during 1955 to provide exact geographic positions and elevations for use in the national mapping program and for other engineering requirements. In the United States, an arc triangulation was established along the Gulf coast for use in connection with offshore oil operations. First-order leveling was done in various parts of the country to determine the extent and magnitude of subsidence due to gradual changes and to determine the changes brought about by recent earthquakes. Maximum settlement at Terminal Island, Long Beach, California had reached 20 ft. since 1928. In Alaska, a major accomplishment was the extension of the triangulation across the difficult Brooks range and along its northern slope.

Under the bureau's magnetic program to furnish the navigational and land surveyor with information on the deflection of the compass needle, observations were made at 32 field stations in the U.S. and Alaska (six were repeat stations) and at observatories. The bureau continued as the repository for magnetic information collected from world-wide sources.

As part of its seismological work, the bureau maintained eight stations for the detection of distant earthquakes, and operated with other federal and private agencies to maintain others. In addition, it operated 71 strong-motion seismographs in areas where strong earthquakes were most likely to occur. Approximately 1,100 earthquakes were located as a result of the co-operative program with several hundred world seismograph

stations. Of notable interest was a series of earthquakes in the Stillwater range in western Nevada. The strongest of the group occurred on Dec. 16, 1954, and produced vertical displacements of 6 to 20 ft. and horizontal shifts of 4 to 12 ft. Total displacements were the greatest in North America since the 1899 Yakutat bay earthquake.

More than 45,000,000 copies of nautical and aeronautical charts and related data were published. A total of 807 nautical charts and 1,550 aeronautical charts were available in different series to meet the needs of marine and air navigation. A new aircraft position chart covering the North Pacific air routes from Seattle to Tokyo was published. The program of printing Loran lines of position on selected nautical charts was completed. (See also OCEANOGRAPHY; SEISMOLOGY.) (H. A. Ko.)

Coast Guard, U.S.

The maintenance of safety and order on the high seas and navigable waters under the jurisdiction of the United States is the responsibility of the U.S. coast guard. The primary objective of most coast guard duties is to prevent avoidable loss of life and property resulting from unsafe or illegal practices. To accomplish this purpose, the coast guard enforces federal maritime laws, operates aids to navigation, promotes efficiency in the operation of merchant vessels and motorboats, and rescues and aids distressed persons, vessels and aircraft.

The maintenance of safety and order in maritime activity is not limited to the strict enforcement of laws, but includes a program of education for shipowners, merchant vessel crews and boatmen, and the enlistment of their co-operation and self-regulation in the prevention of marine casualties.

Administered by the commandant from headquarters in Washington, D.C., the coast guard is a military organization and a branch of the armed forces. It operates under the treasury department except in time of war or when the president so directs,

when it becomes a specialized service in the navy.

Operations of the U.S. coast guard in the fiscal year 1955 were directed primarily toward carrying out its traditional peacetime mission of the maintenance of safety and order on the high seas and navigable waters of the United States. Diminished requirements for search and rescue facilities in the U.S. resulted in the inactivation of 4 cutters in addition to the 12 previously inactivated. Funds available were reduced from \$226,870,872 to \$208,705,170. Military personnel strength remained at approximately the same level as the preceding year, 28,500, while authorized civilian personnel totalled 5,314 as compared with 5,128 during the previous year.

Throughout 1955, the coast guard continued to carry out its regular duties of maritime law enforcement. These functions included the promotion of safety and efficiency in the merchant marine; the inspection of merchant vessels and the enforcement of regulations for motorboats; the operation of aids to navigation, including lighthouses, buoys and electronic signals; the protection of life and property at sea; the rescue and aid of persons, vessels and aircraft in distress; the operation of ocean stations and the international ice patrol, and the maintenance of a state of military preparedness for national emergencies.

The following statistics indicate the volume of law-enforcement activity, but not of preventive activity, taken by the coast guard during the year: vessels and motorboats boarded, 83,323; reports of violations of the Motorboat act, 6,166; reports of violations of port security regulations, 2,695; permits to load or discharge explosives, 1,473; total tonnage of explosives covered by permits, 363,194; explosive loadings supervised, 1,469; regattas patrolled, 801; merchant mariners' documents issued bearing evidence of security clearance, 18,826; waterfront workers screened for security, 30,668; and total rejected as poor security risks, 52.

The coast guard also helped to enforce the Oil Pollution act, anchorage regulations, laws relating to internal revenue, customs, immigration, quarantine and the conservation and protection of wildlife and the fisheries.

Facilities used in assistance operations included a system of 143 lifeboat stations, together with communications centres, bases, vessels and aircraft at strategic points along the coasts and inland waterways. Assistance rendered during the year is summarized in the following statistics: assistance calls responded to, 19,045; value of vessels and aircraft assisted (including cargoes) \$194,404,230; lives saved or persons rescued from peril, 3,242; vessels towed, 7,881; vessels refloated, 1,215; miles disabled vessels towed, 83,358.

During the year 2,483 marine casualties were reported, of which 1,938 were closed with the final report. No inspected and certified U.S. passenger vessel was involved in a serious accident. However, marine casualties claimed 4 lives.

The coast guard worked closely with the American Boat and Yacht council in fiscal 1955. The purpose of the council was to foster self-regulation and to promote recommended practices and engineering standards for improving the design, construction, equipment and maintenance of small craft.

The coast guard completed 5,743 inspections of merchant vessels with a gross tonnage of 17,583,700 tons; made drydock examinations of 4,538 vessels, with a total tonnage of 16,794,052 tons; carried out 19,283 miscellaneous inspections; numbered 358,411 undocumented vessels, and reviewed plans for 11,728 merchant vessels.

A total of 38,389 aids to navigation was maintained in the United States, its territories, possessions, the Trust Territory of the Pacific Islands and at overseas military bases. These aids included 49 loran stations, 378 manned light stations and 53 lightships.

DIESEL UTILITY BOAT introduced by the U.S. coast guard in 1955 for light rescue work, port security and off-shore duty. The 30-ft. boat carries a two-man crew and is capable of 22 knots speed

The coast guard maintained four ocean stations in the North Atlantic ocean and two in the Pacific throughout the year. Ocean station vessels provided search and rescue, communications, air navigation facilities and meteorological services in the ocean areas regularly traversed by aircraft of the United States and other co-operating governments. During the year, coast guard vessels transmitted more than 30,000 weather reports, made approximately 30,000 radio contacts with aircraft, rendered assistance in 38 cases and cruised approximately 498,000 miles.

For the fifth consecutive year the international ice patrol was carried out by aerial reconnaissance so that continuous use of surface patrols was not required.

The coast guard's larger ships consisted of 179 cutters and buoy tenders of various types. The number of fixed and rotary-wing aircraft in operation was 126. Coast guard reserve strength was 3,499 officers and 20,492 enlisted personnel.

The coast guard auxiliary, a nonmilitary organization of volunteers, was active in 328 communities in the promotion of safety and efficiency in the operation of small boats. Its 12,747 members examined 25,245 motorboats, patrolled 297 regattas, and answered 2,535 calls for assistance.

Public health service personnel on duty with the coast guard included 37 dentists, 34 doctors, 9 nurses, one scientist and one sanitary engineer. (A. C. RD.)

Cobalt: see MINERAL AND METAL PRODUCTION AND PRICES.

Cocoa (CACAO). World production and consumption of cocoa beans in 1955 were indicated as in close balance at about 1,784,000,000 lb. Prices fluctuated erratically, partly as a result of uncertain monetary conditions in Brazil, but were generally much lower. Spot Accra, which sold at a record high of 72.9 cents per pound in Aug. 1954, was as low as 31.05 cents per pound in Aug. 1955. Nevertheless, consumption response lagged and grindings were off about one-fifth in the first half of the year after having decreased 17.5% in 1954 as compared with 1953. No rush to rebuild inventories appeared.

U.S. imports of cocoa continued a decline begun in 1951, reaching 516,000,000 lb. valued at \$252,000,000 in 1954 as compared with 659,000,000 lb. valued at \$167,000,000 in 1950.

High cocoa prices financed development projects in the Trust Territory of Togoland. Development was encouraged elsewhere. The Malayan cocoa development project appeared to be approaching an extensive commercial stage. The Philippines appropriated funds for a cocoa development program in which the International Cooperation administration of the U.S. was participating. A controversy over cocoa prices late in 1954 brought the Gold Coast its first major internal crisis under African government. A study by the Food and Agriculture organization indicated that the world market should require at least an additional 85,000 tons by 1960. (J. K. R.)

World Cocoa Production by Leading Areas
(In 000,000 lb.)

Area	Forecast 1955-56	1954-55	1953-54	Average, 1935-36 to 1939-40

Coffee. A world total green coffee crop of 45,056,000 bags (of 132.3 lb. each) was forecast for 1955-56, 11% higher than the 40,593,000 bags of 1954-55 and 8% above the prewar average production of 41,586,000 bags. Exportable pro-

duction was forecast at 36,736,000 bags as compared with 32,297,000 bags in the previous year and an early postwar average (1946-47 through 1950-51) of 28,530,000 bags. Most producing countries showed an increase. Brazil and Colombia accounted for much of the total. French West Africa had a record crop. Frost again hit in Brazil where recuperation of trees damaged by the frost of July 1953 proceeded more rapidly than has been anticipated.

International trade in green coffee declined to 29,100,000 bags in 1954, 16% less than in 1953. Brazil suffered the brunt of the decline; a decrease of about 30% in exports and much lower prices were basic to recurring financial difficulties. Colombia exported 5,700,000 bags against a record 6,600,000 bags in 1953. Africa increased exports, as did Asia and Oceania. In 1954-55 U.S. imports were 20,744,780 bags valued at \$1,268,167,000, compared with 27,633,000 bags valued at \$1,670,598,000 in the previous year.

Prices fluctuated sharply during the year, but within a narrower range and at a lower level than in 1954; the range for most types was roughly between 65 cents and 35 cents per pound, much of the time between 42 cents and 56 cents.

The New York Coffee and Sugar exchange, under criticism from the Federal Trade commission, opened trading in two new futures contracts, "B" to cover several Brazilian grades, and "M" to cover those from Colombia and Central America.

Substantial stocks accumulated in the hands of major producers and more general plantings after the war suggested the

likelihood of further expansion in production over the next five or more years.

In an attempt to stabilize coffee prices an international coffee bureau with export quotas established for producing countries was proposed. Representatives of the Brazilian and Colombian governments suggested minimum prices based on 57 cents a pound (spot, New York) for Brazilian coffee and 60 cents a pound for Colombian, withdrawal of 7,000,000 bags of coffee from the 1954-55 crop (Brazil 5,000,000; Colombia 2,000,000) and inviting Central American producers to co-operate in withdrawal of 3,000,000 bags from the 1955-56 crop. Agreement was not achieved in 1955. Brazil exported 3,980,000 bags in the first quarter of 1955-56 as against only 1,982,000 bags in the same period of 1954-55. (J. K. R.)

Coinage.

The three U.S. coinage mints located in Philadelphia, Pa., San Francisco, Calif., and Denver, Colo., manufactured a total of 1,006,401,253 United States and foreign coins during the U.S. government fiscal year ended June 30, 1955. Details are shown in the tables.

The principal functions of the bureau of the mint, in addition to the manufacture of domestic and foreign coins, are the custody of the government's holdings of monetary metals, valued at many billions of dollars; the acquisition, assaying and re-

ing of gold and silver bullion; administration of the issuance of treasury licences for the acquisition, ownership, possession, use and exportation of gold for industrial, professional and artistic purposes; and the production of historic medals and medals and decorations for the department of defense and other government agencies. The Seattle, Wash., assay office was closed in March 1955. Coinage operations were discontinued at the San Francisco mint at the close of March 1955, but the institution continued to operate as an assay office. Other institutions in operation were the gold bullion depository in Fort Knox, Ky., and the New York assay office in New York city with its adjunct, the West Point silver bullion depository. The office of the director of the mint in Washington, D.C., directs and supervises all operations of the bureau of the mint.

United States.—The 1953 level of production of coke in the U.S. was maintained in 1954 and well into 1955. Coke output follows closely activity in the iron and steel industry. In the first eight months of 1955 oven coke output was 47,767,293 tons and beehive coke was 950,521 tons, totalling 48,717,814 tons or 23% higher than in the first eight months of 1954. Steel operating rates rose steadily in 1955.

(F. E. H.; B. B. M.)

Coldwell, Major James (1888–), Canadian political leader, was born at Seaton, Eng., Dec. 2. He attended University college, Exeter. He emi-

grated to Canada in 1910 and for 20 years was an educationist in Regina, Sask., where he also served on the city council, 1922–32, and was provincial leader of the Saskatchewan Farmer-Labour party, 1932–35. In 1935 he was elected to the house of commons for Rosetown-Biggan, Sask., for the Co-operative Commonwealth federation, being re-elected since in each general election. In 1942 he was named president and party leader of the C.C.F. In 1945 he was a member of the Canadian delegation to the United Nations conference at San Francisco, and in 1953 he was named a parliamentary observer on the Canadian delegation to the UN. He was the author of *Left Turn, Canada*.

Following his re-election as national leader of the C.C.F. for his seventh two-year term at the national convention late in 1954, Coldwell made extensive tours of Great Britain and Israel, with the latter sponsored by the Israeli trade union organization, Histadrut, and he delivered a series of lectures on Canadian affairs at Hebrew University, Jerusalem.

During the 1955 session of the Canadian parliament, Coldwell supported a protocol approving entry of a re-armed western Germany into the North Atlantic Treaty organization, while on a free vote the majority of the C.C.F. members of parliament opposed it. Dealing with the Formosa situation, Coldwell was critical on occasions and urged that the government of Chiang Kai-shek should be exiled and a United Nations trusteeship established over the island. He also suggested that the Peking government be recognized and brought into the United Nations, as it was the effective government in China. He called for a conference of powers possessing atomic weapons to end "dangerous experiments" with their power. Later, he urged a moratorium on atomic and hydrogen bomb tests while the UN conducted a careful scientific investigation to determine whether or not the continuation of such tests endangered the future health of mankind.

Colombia. A republic situated in northwestern South America adjoining the Isthmus of Panamá, Colombia is the only South American country with both Caribbean and Pacific coast lines. Area 439,519 sq.mi.; pop. (1951 census) 11,548,172; (1955 est.) 12,657,000. Approximately 68% of the population is classified as mixed blood, 20% as white, 7% as Indian and 5% as Negro. Most Colombians live in the highlands and mountain valleys of the interior. The capital is Bogotá (1951 pop.) 638,562, (1954 est.) 765,360. Other major cities (with 1951 census, 1954 est. in parentheses) are Barranquilla, 276,199 (324,700); Bucaramanga, 102,877 (136,170); Cali, 241,357 (365,800); Cartagena, 111,291 (142,800); Cúcuta, 70,375 (107,820); Ibagué, 54,347 (110,900); Manizales, 88,893 (138,680); Medellín, 328,294 (431,380); Neiva, 33,040 (55,540); Pasto, 48,853 (91,520); Popayán, 31,866 (49,440); Santa Marta, 37,005 (51,660); and Tunja, 23,008. Language: Spanish. Religion: predominantly Roman Catholic. President in 1955: Lieut. Gen. Gustavo Rojas Pinilla.

History.—During 1955 Colombians were exposed to increasing evidence that the military intended to remain in power. President Rojas Pinilla preserved the state of siege, restricted radio news broadcasts to government releases, imposed regulations on newspaper reporting and editorializing tantamount to complete censorship, established an information directorate through which all official news (even on the national police court level) had to be cleared, suspended or closed about a dozen newspapers and manipulated newsprint imports so that sympathetic journals would not be throttled. Meanwhile, the government-backed National Action movement foundered in

February for lack of popular support. An official publication house was created to issue a government newspaper, and a government radio and television network was also under development.

Coffee prices and sales proved a substantial disappointment. Exchange earnings were generally below expenditures on imports, so the draft on gold and exchange reserves reduced holdings to well below 1954 levels. Import, exchange and credit controls designed to combat trade imbalance and inflation proved inadequate. Furthermore, the government was spending considerable sums on such unrewarding projects as the Paz del Río industrialization plan. The steel mill reportedly suffered a net operating loss of \$11,000,000 in its first eight months of operation. At the same time, Colombians had to pay unusually high duties on steel imported to cover the wide margin that existed between domestic production and consumption.

Related to economic policy was the visit in August of a mission from the International Bank for Reconstruction and Development. It was understood to have advised the government that expenditures on transportation and agricultural development offered more promising results than the contemplated development of automobile, arsenal and cement industries at Paz del Río. Meanwhile, the plans for a Cauca valley "TVA" progressed. The new Puerto Berrío-Medellín petroleum pipeline was functioning, the Medellín-Turbo highway was inaugurated and the national merchant fleet opened a new service from Ecuador and the west coast of Colombia to North and Central America.

(R. HN.)

Education.—In 1953 a total of 16,270 schools reported 1,236,728 students and 40,795 teachers. Reporting schools included 12,223 primary schools with 1,072,532 students and 25,992 teachers; 585 secondary schools, 65,618 students; 220 commercial schools, 17,340 students; 93 normal schools, 8,611 students. In 1954 there were 28 universities comprising 84 faculties and 22 institutes and schools of higher learning with a total of 11,996 students and 2,449 teachers.

Finance.—The monetary unit is the peso, valued at 39.84 cents U.S. currency, basic rate, during 1955 and at 25 cents, free rate, on Aug. 29, 1955. The national budget for 1955 totalled 1,269,446,546 pesos. Actual revenue in 1954 (including proceeds of loans) was 1,286,703,000 pesos; expenditure was 1,120,290,000 pesos. The internal debt on June 30, 1955, was 802,341,000 pesos and the external debt (excluding interest) the equivalent of 219,964,000 pesos. Currency in circulation (June 30, 1955) totalled 625,000,000 pesos; demand deposits (April 30, 1955), 1,124,000,000 pesos.

Trade and Communications.—Exports in 1954 (excluding gold) totalled 1,642,847,752 pesos; imports, 1,679,206,000 pesos. Leading exports were coffee (84%), petroleum (11%), bananas (2%), tobacco and wood. Leading customers were the U.S. (79%), Germany (5%), the Netherlands Antilles (5%), the Netherlands (2%) and Sweden (2%); leading suppliers, the U.S. (63%), Germany (8%), the U.K. (4%), France (4%) and the Netherlands Antilles (3%).

In 1951 there were 1,787 mi. of main-line railroad track, comprising 14 different systems; in 1954, they carried 12,012,428 passengers and 5,082,858 metric tons of freight. Highways (1951) totalled about 12,600 mi. Registered motor vehicles (Jan. 1, 1955) included 58,761 automobiles, 58,007 trucks and 10,542 buses. In 1954 national air lines carried 976,196 passengers and 129,097 metric tons of freight. In that year, 271,949 passengers and 1,909,627 tons of freight were carried on the Magdalena river. On Jan. 1, 1954, 128,970 telephones were in use.

Agriculture.—Coffee production in the 1954-55 season (preliminary figures) totalled 6,500,000 bags of 132 lb. each. Exports in 1954 were 5,753,819 bags, of which 4,961,027 bags went to the U.S. and 302,240 bags to Germany. Production estimates for other crops in 1954-55 included rice (rough) 620,000,000 lb.; cotton 122,000 bales of 480 lb. each; sugar (centrifugal) 245,000 metric tons; sugar (panela) 600,000 tons; tobacco (year 1954) 56,200,000 lb.; cacao 35,273,000 lb. Banana exports in 1954 were 7,924,913 stems, of which 4,043,323 went to the U.S. and 2,753,855 to Germany. In 1951 there were an estimated 15,512,000 cattle, 2,782,000 hogs, 1,298,000 horses, 1,339,000 sheep and 637,000 goats.

Manufactures.—According to the 1953 census of manufacturing industries Colombia had 8,217 manufacturing enterprises (5 or more workers) with 152,106 employees and annual gross production valued at 3,267,624,000 pesos. The most important industries by value of production were foodstuffs (42%), beverages (12%), textiles (11%), shoes and apparel (8%) and chemicals (5%). Production (1954) included cement 962,188 metric tons and electric energy 1,087,174,000 kw.hr.

Minerals.—Production in 1954 included gold 377,466 troy ounces; silver 112,533 oz.; platinum (exports) 28,105 oz.; terrestrial salt 172,420 metric tons. Crude petroleum production was 39,979,000 bbl.; exports were 30,408,535 bbl., of which 14,403,186 bbl. went to the Netherlands Antilles (for refining) and 12,281,634 bbl. to the U.S. Refined products included 2,752,486 bbl. of gasoline and 6,260,276 bbl. of fuel oil.

(J. W. Mw.)

Colorado. A Rocky mountain state in the west central part of the United States, Colorado has a mean elevation above sea level of 6,800 ft., the highest of any state in the nation. Admitted to the union in 1876 as the 38th state, it is generally known as the "Centennial state" in celebration of its 100th anniversary of the signing of the Declaration of Independence. The area of 104,247 sq.mi. includes 325 sq.mi. of water. The United States owns 34.5% of the total land area and 59.3% is privately owned. The remainder belongs to state, county and municipal governments.

The U.S. bureau of the census population estimate for Colorado as of July 1, 1955, was 1,508,000. The 1950 census figure was 1,325,089. Of the population 62.7% is urban; 37.3% rural. 93.4% native white; 4.5% foreign-born white; 1.5% Negro; 0.6% other. The capital, Denver, had a 1950 population of 417,786. Other cities (1950 census) are Pueblo, 63,685; Colorado Springs, 45,472; Greeley, 20,354.

History.—The 1955 regular session of the 40th general assembly convened at Denver Jan. 5, 1955, and adjourned April 1, 1955. There were 330 senate and house bills passed. Important among these was senate bill 313 which authorized anticipatory warrants to be issued by cities and counties for the purpose of defraying the cost of construction, erection or reconstruction or improvement of public projects; senate bill 273 which amended the existing law to provide that the location of mineral claims could be made upon state lands. (This bill was encouraged by tremendous activity in uranium exploration and discovery that took place in Colorado during the year.) Senate bill 67 presented an entirely new military code applicable to the state national guard and organized state militia; house bill 17 increased the number of state highway patrolmen from 140 to 200; house bill 111 provided equal pay for equal work regardless of sex; house bill 284 created the Colorado antidiscrimination commission for matters covering fair employment practices; and house bill 460 established a commission for the reorganization of state government. House bill 235 received much attention and publicity for establishing motor vehicle inspection stations on the public highways to effect the collection of fees, licenses or taxes imposed by law on motor carriers. Heretofore collection of motor vehicle taxes was next to impossible. The bill appropriated \$375,000 from the highway fund for construction of ports of entry, and \$250,000 for administering the same. The jurisdiction of these ports was transferred to the department of revenue. Important historically was the official opening and the enrolment of the first class of the Air Force academy at Lowry Field in Denver. Construction on the permanent site of the academy at Colorado Springs got under way during the year.

The principal state officers for the term Jan. 11, 1955, through Jan. 8, 1957, were: Edwin C. Johnson (Dem.), governor; Stephen L. R. McNichols (Dem.), lieutenant governor; George H. Baker (Dem.), secretary of state; Earl E. Ewing (Rep.), treasurer; Homer F. Bedford (Dem.), auditor; Duke W. Dunn (Rep.), attorney general.

Education.—The state appropriation for education in public schools for 1955-56 was \$14,000,000. The school population, including persons from 6 to 21 years of age, amounted to 358,728 as of April 1955. Registered students numbered 305,770. There were 12,676 teachers employed during the 1954-55 school year. The 132 county and municipal libraries of Colorado loaned 5,057,060 books, films, records and other library materials to their patrons. The total book stock of Colorado's libraries was 1,812,437 with a total operating expense of \$1,339,090.32 for fiscal year ending June 31, 1955. H. Grant Vest was state commissioner of education.

Social Insurance and Assistance, Public Welfare and Related Programs. Disbursements for welfare purposes within Colorado for assistance administration in 1954 amounted to \$69,277,220.73. Payments to, on behalf of, recipients amounted to \$65,964,861.36, exceeding the 1953 expenditure by .90%. The old-age pension used 78.02%. The remainder 21.98% was distributed among the other programs in the following order: aid to dependent children, 10.71%; general assistance, 4.70%; aid to

needy disabled, 4.69%; tuberculosis hospitalization .85%; aid to the blind, .49%; child care .54%.

From Jan. 1 until Aug. 1, 1955, there was an average of 54,009 old-age pension cases per month receiving an average payment of \$81.07 per case; aid to dependent children 5,954 cases, average payment \$104.95; aid to the blind, 322 award cases, average payment \$64.70; general assistance, 1,951 cases, average payment for subsistence \$41.18; aid to the needy disabled, 4,939 cases, average payment \$55.58 per case.

There were four correctional institutions with a total of 2,133 inmates as of Sept. 1, 1955. These were divided as follows: boys' industrial school, 221; girls' industrial school, 104; boys' reformatory, 356; and state penitentiary, 1,452. The 1955-56 budgets for these institutions were as follows: boys' industrial school, \$325,000; girls' industrial school, \$200,000; boys' reformatory \$430,000; state penitentiary, \$1,356,704. The total budget for all correctional institutions was \$2,311,704.

Communications.—Highways (county, state and federal) as of Jan. 1, 1955, totalled 74,282 mi.; 7,987 mi. were state highways, 62,241 mi. county highways and 4,054 mi. municipal. Total funds for all highway use for 1954 were \$32,050,463.33. There were 525 mi. of highway constructed during 1954 and 60 bridges were constructed. There were 14 railroads operating within the state with a total mileage of 3,995.04 and a valuation of \$134,396,940. Thirty-three telephone companies were in business with 1,085,376.71 mi. of wire and a total valuation of \$43,650,110. As of July 31, 1955, there was a total of 547,993 telephones in use that were serviced by the Bell system. There were 44 standard AM radio stations, 4 FM stations and 10 television stations.

Banking and Finance.—Colorado's 153 federal and state banks reached an all-time high of \$1,551,278,133 in deposits as of Jan. 1, 1955. This represented an increase of \$121,547,188 or 8.5% over the total deposits of \$1,429,732,945 on Jan. 1, 1954. The value of building permits for the area during 1954 amounted to nearly \$185,000,000, an increase of \$36,745,000 over 1953. As of June 30, 1955, there were 52 state and federal savings and loan associations with total resources amounting to \$378,792,000.

The cash balance in the state treasury as of June 30, 1955, was \$53,789,799.69. The total receipts in revenues for the fiscal year ending June 30, 1955, were \$238,549,617.84. The total cost for operating and non-operating expenditures for the 1954-55 period was \$232,035,801.29. As of June 30, 1955, Colorado had a general fund balance of \$20,789,826.52 which included a \$10,000,000 revolving fund reserved by statute for working capital.

Agriculture.—The cash income from farm marketings through 1954 aggregated \$426,866,000, of which \$278,359,000 resulted from the sale of livestock and livestock products and \$148,507,000 from the sale of crops. Government payments including rental and benefit, soil conservation, agricultural adjustment program, price parity and Sugar Act payments amounted to \$11,215,000. Cash farm income and government payments totalled \$438,081,000.

The number of cattle and calves on farms Jan. 1, 1955, was 2,054,000. The number of stock sheep totalled 1,702,000. Cattle in feed lots totalled 275,000. Hogs and pigs totalled 190,000 head.

Manufacturing and Industry.—The University of Colorado Bureau of Business Research estimate of value added to Colorado manufacturers in 1954 was \$438,500,000. There were an estimated 1,791 manufacturing plants operating full-time in Colorado. Wages and salaries for manufacturing were estimated at \$228,008,000 and gross sales of manufacturers, traders and jobbers were \$657,000,000.

From Jan. 1, 1955, through Aug. 1, 1955, the monthly employment figures averaged 478,900 employed in nonfarming occupations and 90,400 in farming for a total employment of 569,300 for both farming and nonfarming occupations. The unemployment monthly average for this same period was 20,100.

Tourist travel in Colorado is the fourth largest industry in the state. In 1954 the income derived from 3,883,000 vacationists was \$298,408,000 or an increase of 12.5% over 1953. The 1955 estimate as of Sept. 22, 1955, was 3,966,000 tourists spending \$326,719,000. (H. L. Hy.)

Mineral Production.—Table III shows the tonnage and value of Colorado minerals for 1953 (preliminary) compared with 1952. It includes only those items whose value was \$100,000 or more. Colorado was first among the states in production of molybdenum, second in fluorspar and pumice, third in feldspar and fourth in lead. In 1953 it ranked 17th in value of its mineral output, with 1.47% of the U.S. total.

Commonwealth of Nations. This is a community of independent nations and dependent or semidependent territories bound together by allegiance to the British crown or by recognition of the British sovereign as head of the Commonwealth.

The communiqué issued at the close of the Commonwealth prime ministers' conference (Jan. 31-Feb. 8, 1955) declared the Commonwealth's wish to promote conditions of peace; its NATO (North Atlantic Treaty organization) members hoped for early ratification of the Paris agreements and the acceptance of the Federal German republic into the western community. It urged continued close association with the United States and took note, without comment, of Pakistan's intention to become a republic but to remain a full Commonwealth member.

The then United Kingdom foreign secretary, Sir Anthony Eden, met the Indian prime minister, Jawaharlal Nehru, in New Delhi (March 2), and Nehru visited Great Britain (July 8); Pakistan's governor-general, Ghulam Mohammed, and prime minister, Mohammed Ali, visited Nehru. The Colombo powers (U.K., India, Pakistan, Ceylon, Indonesia) convened at Bogor, Indonesia (Dec. 28, 1954), at Simla, India (May 9), and in Singapore (Oct. 17). A conference of the southeast Asia defense treaty powers at Bangkok, Thailand, brought together the U.K., Australian, New Zealand and Pakistan representatives (Feb. 23). Nehru received Yugoslavia's president, Marshal Tito, in New Delhi, and much was heard of Nehru's five principles of independence, nonaggression, equality, noninterference and co-existence. India continued to deplore the southeast Asia treaty's existence, while its Commonwealth colleagues, Australia and New Zealand, implementing decisions taken at Bangkok, sent air squadrons to Malaya, to be followed by two Australian army divisions. Nehru objected strongly to Pakistan's adherence to the Turco-Iraqi defense treaty (Sept. 25). Relations with Pakistan seemed to be improving when an Indian statement (July 8) that a plebiscite was inadmissible in Kashmir—because times had changed and had for one thing brought a Pakistan-U.S. military

alliance—caused Pakistan to lodge an official protest. Pakistan quarrelled with Afghanistan on the "Pakhtunistan" question. But both India and Pakistan, with Ceylon, played a big part in the Asian-African conference (q.v.) held at Bandung, Indon. (April 18-21). At Bandung Ceylon's prime minister, Sir John

Kotelawala, called on members assembled to mediate between the giants of communism and anticommunism, and drew attention to the existence of Soviet colonialism. Ceylon was also aware of another pressure: "the day we dispense with Englishmen entirely," remarked Kotelawala on May 25, "the island

will go under India." Pakistan, as befitted a southeast Asia defense treaty member, stood out for a nation's right to arrange for its collective defense, while Nehru saw NATO as yet another shield for colonialism. China, in the Indian view, should be allowed a seat at the United Nations.

The Union of South Africa's prime minister, J. G. Strijdom, declared—and in "English" Cape province, be it noted—that the Union Jack was "a foreign flag" (May 7), later remarking, however (Sept. 13), that it was unwise as yet to set a date on the dawn of the republic to come. The union left UNESCO (the United Nations Educational, Scientific and Cultural organization) (April 5), because it was "futile" and because it sought to interfere with racial problems, and continued to pursue to logical conclusions the *apartheid* policy.

Australia, besides prohibiting any hydrogen bomb tests on its territory (Feb. 18), absorbed itself in the fascinating aftermath of the Petrov defection: the royal commission on espionage published its findings on Sept. 14. Linked to this was a history of fissures in the federal and state Labour parties, and the indiscretions of the Labour leader, H. V. Evatt (which included a correspondence with the U.S.S.R. foreign minister, V. M. Molotov, wherein the latter not surprisingly discredited Petrov's revelations) gave the prime minister, Robert Menzies, confidence to call for a general election. As a "gentlemen's agreement" (Feb. 3) that the U.K. would buy more antipodean primary produce "in the spirit of Ottawa, 1932" was apparently not honoured, both Australia and New Zealand clapped on tariffs on imports (Oct. 13).

The main task of Canada, as the U.S. population soared to 164,000,000, was to insist on its Canadianism, and Canada's external minister, Lester Pearson, was heard to disagree with any "tough" U.S. policy toward Formosa while welcoming U.S. secretary of state, John Foster Dulles, to Ottawa, Ont. (March 17).

(A. P. T.)

The visit of Princess Margaret to the West Indies in February was outstandingly successful and showed how strong loyalties are. The ministers of the colonial office spent an increasing time in the colonies. The colonial secretary, A. T. Lennox-Boyd, visited Nigeria, Hong Kong, North Borneo, Brunei, Sarawak, Singapore, Malaya, Cyprus, Malta and Gibraltar; the minister of state, Henry Hopkinson, visited Aden; and the parliamentary undersecretary, Lord Lloyd, went to the West Indies.

One of the most striking tendencies in colonial affairs in the United Kingdom was the large and continuing increase in immigrants from the West Indies resulting from overpopulation and under-employment in some islands, principally Jamaica, the lowering of the West Indian quota into the United States and full employment in the United Kingdom.

BIBLIOGRAPHY.—G. F. McCleary, *Peopling the British Commonwealth* (London, 1955); W. R. Brock, *Britain and the Dominions* (Cambridge, 1955); W. E. Simnett, *Emergent Commonwealth: the British Colonies* (London, 1954; New York, 1955).

Communism. The year 1955 brought important tactical changes in the party line pursued by the world-wide communist movement under Moscow's leadership. The "new look" of communist policy under Georgi M. Malenkov stressed the possibility of "peaceful co-existence" of countries with different ideologies and economic systems and emphasized the need for raising the low standards of living of the people in communist-dominated lands.

The "new look" of communist policy expressed itself also in the ideological field. But there it became entirely clear that the changes were in no way fundamental changes of ideology or final goal but purely changes in emphasis in the flexible adaptation of the unchangeable Marxist-Leninist doctrine to the exigencies of a changing domestic and world situation.

Literature and science in communist lands are directed instruments of party policy. In 1954 two novels, *The Seasons* by Vera Panova and *The Thaw* by Ilya Ehrenburg, for the first time dared to criticize shortcomings of Soviet society, not only the terror and poor living conditions but also the cynicism and careerism of artists and writers. The novels were rejected by Soviet critics, but the second All-Union Congress of Writers, the first held in 20 years, which met from Dec. 15 to Dec. 26, 1954, in the Kremlin, admitted several important writers who had been purged during the last decade of Stalin's regime and proclaimed that the Soviet writer must not be afraid to present conflicts and contradictions that still existed in Soviet Russia. Yet at the same time the subordination of art to politics was stressed and the writers continued to be obliged to fight in their works for the building of communism and to expose the dangers of capitalism. It was difficult to see how the professed aim of an unwavering loyalty to party dogma and the desired avoidance of a boring oversimplification and moralism in Soviet literature could both be achieved. Though the congress pleaded for the translation of the best works of modern writers of all countries, it emphasized that these writers must be "progressive" and "writers of good will." In this spirit of cultural exchange, though with old ideological limitations maintained, the U.S.S.R. ended its eight-year-old boycott of UNESCO and was represented at its conference in Montevideo, Urug., in Nov.-Dec. 1954.

Return to Stalinism?—The "new look" policy, which was identified with Malenkov and his stress on the need of supplying consumer goods as against the ruthless promotion of heavy industry under Stalin, seemed on the point of abandonment when *Pravda*, the official communist newspaper, published an article on Jan. 24, 1955, signed by its editor, Dmitri Shepilov—an unusual procedure—in which he denounced the "bourgeois" stress on consumer goods and declared it to be the party's policy to give first priority to the production of industrial machines and tools. The chief spokesman for the priority of heavy industry over consumer goods production, contrary to the policy

initiated by Premier Malenkov in Aug. 1953, was Nikita S. Khrushchev, the party's first secretary. This change in the economic line preceded the unparalleled way in which Malenkov resigned as premier on Feb. 8, 1955, before the supreme soviet. Khrushchev had called those who did not regard the growth of heavy industry as the main task, "confused" and "pitiful theoreticians." Malenkov himself confessed to his incompetency and theoretical confusion, and he was replaced as premier by Marshal Nikolai A. Bulganin. Some pro-Soviet observers in the west saw in this change of leadership a resurgence of Stalin's strong antiwestern line and pretended that the reason for it was the west's insufficient response to Malenkov's "peace offensive." In reality the new regime under Khrushchev and Bulganin soon started a new "peace offensive" which far outbid Malenkov's "new look."

End of the Cold War?—Beginning in April 1955, the "iron curtain" was lifted to a considerable degree. Western visitors and journalists were granted visas to visit the U.S.S.R. Delegations of Soviet scientists participated in various international scholarly congresses. Soviet agricultural delegations visited the United States and Britain and a U.S. agricultural delegation went to Moscow and acquainted itself with the state of Russian agriculture. The International Parliamentary union at its meeting at Helsinki, Fin., accepted Soviet "parliamentarians" into membership. A top-level exchange visit between church leaders of the National Council of the Churches of Christ in the U.S.A. and Soviet church leaders was suggested by the Soviet Union for early 1956 and accepted by the National council at a meeting of the council's general board on Oct. 5, 1955. The Soviet pianist Emil Gilels was the first important Soviet musical performer to visit the United States since 1921 and the Soviet violinist David Oistrakh and the ballerina Galina Ulanova were to follow.

More important, however, were a number of actions in the field of foreign policy which clearly revealed the new line of replacing the former bitter vituperations by a more civilized and co-operative approach. The state treaty with Austria which the Soviet Union had obstructed for many years was finally quickly concluded and in July 1955 the independence of Austria was restored and the evacuation of all occupying forces begun. On July 18 the Geneva conference of the heads of the Big Four Powers, which Sir Winston Churchill had demanded more than a year before, started in Geneva, Switz., between the leading statesmen of the Soviet Union and of the three western democracies, the United States, Britain and France. Though the talks did not solve any of the outstanding problems between the communist and the free world, or even bring any of these problems nearer to solution, they nevertheless created a friendlier atmosphere in international relations than had existed at any time during the last ten years.

The chancellor of the German Federal Republic was invited to Moscow and his visit there in Sept. 1955 brought the promise of the establishment of diplomatic relations between the two countries. Later in the month, during the visit of the leading Finnish statesmen in Moscow, the Soviet government promised to restore to Finland the military base of Porkkala in the vicinity of Helsinki, Finland's capital. The most important and unexpected single step undertaken by the new Soviet government to lessen tensions was the visit of the Soviet leaders to Belgrade, Yugos., at the end of May.

The Problem of Titoism.—From 1948 Titoism had been the strongest word of condemnation hurled against dissident communists in the Soviet Union and in the communist-dominated central European countries. Many communist leaders were executed or imprisoned as Titoists. The forces of the Cominform (Communist Information Bureau) were largely mobilized against Titoism and Tito's Yugoslavia. After Stalin's death a slow

process of *rapprochement* began. In May 1955, during his visit to Belgrade, Khrushchev, not mentioning Stalin, stressed the common Marxist-Leninist foundation of the two brands of communism represented by the Soviet Union and by Tito's Yugoslavia, and recognized the Yugoslav claim that "socialism" could be realized in different ways. He seemed thereby to abandon the Kremlin's claim of being the only infallible guide on the road to socialism. Tito's Yugoslavia, though frankly communist did not become a Moscow satellite but retained its independence and preserved the ties with the west.

Communist Goals.—In spite of this "new look," fundamental communist policy had not changed. It remained firmly anchored on the basis of an uncompromising Marxism-Leninism. All political, economic and cultural activities remained strictly subordinated to the goal of spreading communism throughout the world. The communist leaders were convinced that history was on their side and that the capitalistic world would disintegrate. This disintegration seemed to be the very purpose of the "peace offensive." It not only tried to obtain a respite by reducing international tension in order to overcome internal crises of the Soviet system, but it wished above all to retard any increase in the political unity and military strength of the free world and even to undo them as far as possible. In that process the United States and through it the free world should be deprived of its main military advantage over the communist bloc, its atomic weapons, and the United States forces should be withdrawn from Europe and Asia. Communism was unable by the aggressive methods which it employed under Stalin's leadership to weaken or destroy democracy. On the contrary, under communist pressure the democratic nations co-operated more closely than ever before and thus created through their unity a defensive military and ideological strength. It was this western strength, as expressed in the North Atlantic Treaty organization which forced the Communist leaders to adopt the "new policy." The lessening of the tension was therefore the result of western unity and strength.

Communism Outside the U.S.S.R.—Communist policy in the satellite countries followed closely the Moscow-directed line. Tension with the west was lessened. The Soviet leaders on their return from Belgrade visited the principal satellite countries to acquaint them with the new policy line. To balance the recognition of the German Federal Republic, the Moscow government proclaimed the sovereignty of the German Democratic Republic, as the Soviet-occupied zone of Germany was called. After the neutralization of Austria and Yugoslavia, the Soviet

government aimed at the creation of a neutral Germany. It played upon the desires of German nationalism and its inclination to prefer national unity and power to the strengthening of German democracy through close union with the west. But communism itself had lost the appeal which it apparently exercised in some European countries in the critical years after World War II. The economic consolidation of Europe, achieved to a large extent with U.S. help, decreased Europe's vulnerability to communism. Even in Italy the communist-dominated Confederazione Generale Italiana del Lavoro lost its control over the workers. In the elections of shop stewards in the Fiat automobile works, the country's largest industrial enterprise, in March 1955, only 39% voted for the communist-dominated trade union as against 63% in 1954, 65% in 1953 and 69% in 1950.

More propitious than in Europe was the field for communism in Asia and Africa. Yet even there the communists did not do as well as could be expected. They had hoped to set up a political beachhead in India by taking over the government in the newly formed state of Andhra, but the elections there at the end of February gave them less than one-third of the votes and only 15 seats out of 196 in the new legislature. The "conference for relieving tension in international relations" held in Delhi from April 6 to April 10, 1955, in which about 200 delegates of different political shades from more than a dozen Asian countries and the Soviet Union participated, was organized with the special purpose of utilizing anticolonial revolutionary forces for communist goals. The appeal to the Asian and African peoples for a common fight against western capitalism was from the beginning one of the main planks in Lenin's program. At the Delhi conference the principal Chinese delegate, Kuo Mo-jo, president of the Chinese Academy of Sciences, attacked the United States for striving to "conquer Asia and create there a new colonial policy."

Communist propaganda in Asia and Africa was attempting to direct the energies of nationalism in the former colonial areas against the west. But at the Asian-African conference at Bandung, Indonesia, which was held at the end of April 1955 and in which 29 countries participated, a number of them, notably Turkey, Iraq, Lebanon, Pakistan, Ceylon, Thailand, the Philippines, the Sudan and Liberia, vigorously opposed communism. Chinese communist Premier Chou En-lai followed in Bandung the new official communist policy of friendliness and moderation, thereby trying to strengthen the friendship with the Asian and African neutralist nations, of which India was the leader.

Communist strength appeared to be growing during 1955 in Indonesia, where Pres. Achmed Sukarno often referred to China and the Soviet Union as countries where great construction based upon "progressive" mass appeal was going ahead. The first elections held in Indonesia since the achievement of the independence of the country six years before took place at the end of Sept. 1955. Though the complete results were not known by mid-October, the communists seemed certain of second place and the Nationalists, whose cabinet received communist support during its two years in office, took the lead. Communist influence was also very strong in Singapore with its overwhelmingly Chinese population which in 1955 received far-reaching democratic self-government from the British administration. Community Chest. Community chest is the name given to a local federation of health, welfare and recreation agencies which are supported by voluntary contributions. Its purpose is to raise annually, through a single, united community campaign, funds for the support of its member agencies. Associated with or a part of the chest in many cities is the community welfare council, the purpose of which is to co-ordinate the services of its member agencies and to provide a channel for community-wide planning for health and welfare.

In about 700 U.S. cities the community chest has been expanded into a broader type of fund-raising organization which includes in the annual campaign not only local agencies but one or more of the national health agencies. In some cities this change has been accomplished without a change of name; in others a new organization has been formed, often called the united fund. The common characteristic of all these campaigns is that they represent the united way of giving to many causes through one annual campaign. National promotion on behalf of local campaigns is carried on under the name of United Community Campaigns of America.

The national association of local chests, united funds and councils is Community Chests and Councils of America, Inc., which was established in 1918.

Of the 2,456 community chests, united funds and welfare councils in operation in July 1955 (1,997 chests and funds and 459 councils), 1,929 chests and funds and 434 councils were in the U.S., 68 chests and 25 councils in Canada. The chest and council idea has also been adopted in the British West Indies, Japan, the Philippines, the Canal Zone, Cuba, Greece, Australia and Mexico.

Today almost every city in the U.S. has a community chest, united fund or similar plan of federated financing for its voluntary social services. In 1,858 cities in 1954, more than 25,000,000 contributions totalling \$302,023,059 were made through community chests and united funds to be used during 1955 for voluntary health and welfare services.

Officers of Community Chests and Councils of America, Inc., for 1955 included: honorary president, Gerard Swope (New York city); president, Albert J. Nesbitt (Philadelphia, Pa.); treasurer, H. L. R. Emmet (Erie, Pa.); secretary, Foster W.

Doty (Springfield, Mass.); vice-presidents, John A. Greene (Cleveland, O.); James A. Linen (Greenwich, Conn.); William G. Vollmer (Dallas, Tex.). Ralph H. Blanchard was executive director. Headquarters are at 345 East 46th street, New York city. (B. A.)

Community Planning: *see* BUILDING AND CONSTRUCTION INDUSTRY; MUNICIPAL GOVERNMENT; TOWN AND REGIONAL PLANNING; URBAN TRANSPORTATION, U.S.

Community Trusts. Aggregate assets of \$141,276,907 were reported by community trusts in the United States and Canada at Jan. 1, 1955. During 1954 these composite charitable foundations appropriated \$6,099,181 and received incoming resources totalling \$12,923,438.

The largest of these organizations was the New York Community trust, whose 105 funds were valued at \$24,508,837. The Cleveland (O.) foundation reported resources of \$18,309,356; Permanent Charity fund, Boston, Mass., \$13,638,839; Chicago (Ill.) Community trust, \$12,133,225; and California Community foundation, Los Angeles, \$9,521,235.

The New York Community trust disbursed \$1,140,977 in 1954; Cleveland foundation, \$746,490; Chicago Community trust, \$639,753, and Permanent Charity fund (Boston), \$598,863.

Funds newly created in that year included \$3,070,140 accruing to the Indianapolis (Ind.) foundation; \$2,098,997 added to the New Haven (Conn.) foundation; \$1,821,676 reaching the Hartford (Conn.) foundation, and \$1,127,673 coming into the Winston-Salem (N.C.) foundation.

Of 73 community trusts surveyed in 1954, 71 were administering principal resources and 65 were making current distributions out of 1,256 funds on hand. Their cumulative disbursements in the 20 years from 1935 through 1954 stood at \$56,450,086.

A community trust consists, usually, of a series of trust funds of varied sizes, held by any one of a number of corporate trustees and applied for any of diverse charitable uses under the central supervision of a joint distributing committee. The trustee of a given fund is ordinarily chosen by its founder. The custody and investment of any given fund are the responsibilities of its trustee. The distributing committee authorizes all disbursements by the trustee and, in doing so, customarily undertakes to give expression to any specific charitable desires of a founder—stated either when the trust is created or perhaps (in cases of living trusts) subsequently—but it is also empowered to take appropriate remedial action if originally expressed preferences later become impossible or impractical of execution. Congregational Christian Churches. Membership of the Congregational Christian Churches in the United States increased by 26,818 and Sunday school enrolment by 49,044 in 1954. The gross increase in church membership was 110,709, the largest such increase the denomination had ever enjoyed. The net increase was 2.2%. Of the new members admitted during 1954, 53,894 never before had made public confession of the Christian faith. This was the largest number of additions "by confession" for any year during the more than three centuries of Congre-

gational history in the country.

The first Congregational church in America was founded by the Pilgrims in 1620. By 1955 the denomination had 1,310,577 members in 5,536 Congregational Christian Churches. The Sunday school enrolment was 743,532.

During 1954, 56,815 persons entered Congregational Christian Churches from other Christian churches and 29,499 left the former for the latter. At the beginning of 1955 there were 133,707 persons who had moved from the neighbourhood of the churches where they were members without becoming affiliated with any church in the neighbourhood to which they had gone.

Giving to benevolences in 1954 increased \$1,538,713 over 1953 to \$9,525,437; and the expenditures by local churches on their own programs went up \$3,293,061, totalling \$43,024,531. The denomination spent \$20,343,044 on new church buildings, an increase of \$3,999,379. The value of church property rose \$30,662,193 to \$437,888,284.

Twenty-five new Congregational Christian church buildings were completed and dedicated in the United States during 1954. The number of churches with memberships of 250 to 499 rose from 899 to 930; nine churches grew to memberships of from 500 to 999 and 196 churches were recorded with memberships of more than 1,000—seven more than the previous year. Fifty-two churches, with less than 50 members, were closed during the year. This continued the movement, noticeable for more than a generation, toward fewer but stronger churches.

At the beginning of 1955 there were only 408 congregations without regular ministers. The pulpits were therefore better supplied than in any previous year in the entire history of the denomination.

Among regional groups the greatest membership gain was made by the Massachusetts conference, 4,334 members being added to the rolls of the conference's 587 churches. Two new church buildings were completed and dedicated during 1954. The Massachusetts conference also led in benevolence giving with increases from \$1,342,623 in 1953 to \$1,400,259 in 1954. Local church budgets rose \$683,877 to \$6,750,966.

The Congregational Christian Churches were planning to unite with the Evangelical and Reformed Church in 1957 to form the United Church of Christ, with a total of more than 2,000,000 members. This union, if consummated, would be according to Basis of Union and Interpretations as drawn up by the two denominations and approved by them in 1947-49. These documents outlined a procedure for consummating the union and beginning the work of the United Church of Christ, as the new denomination would be called. (*See also* CHURCH MEMBERSHIP.) (D. Ht.)

Connecticut. One of the New England states of the United States and also one of the original 13 states. Connecticut is known as the "Nutmeg state," "Land of Steady Habits" or "Constitution state." With an area of 5,009 sq.m. of which 110 sq.mi. are water, it is bounded on the north by Massachusetts, on the east by Rhode Island, on the south by Long Island sound and on the west by New York. According to the revised estimate by the bureau of the census, the population July 1, 1955, was 2,233,000 as compared with the 1950 census of 2,007,280. Largest cities and population (1950) were Hartford (the capital), 177,397; New Haven, 164,443; Bridgeport, 158,709; Waterbury, 104,477; Stamford, 74,293; and New Britain, 73,726.

History.—The regular biennial session of the general assembly met on Jan. 5, 1955, and adjourned on June 9, without co-

pleting action on important fiscal matters. The governor, therefore, called a special session for June 22 which quickly finished its business and adjourned June 24. A general fund appropriation of \$332,900,000 for the biennium was approved, the largest on record. To balance the budget, the 3% sales and use tax was continued and also the corporation business tax at 3½%. The gasoline tax was increased from four cents to six cents per gallon. A bill legalizing bazaars and raffles, with rigid controls, including local option, was passed after much debate and signed by the governor. The financial responsibility of relatives for persons in state hospitals was limited to a maximum of \$18.75 per week. Because of the tremendous losses of taxable property to towns caused by the floods a second special session of the legislature was called for Nov. 9. As of Dec. 1 no agreement had been reached as to the amount of relief needed, but it was probably between \$30,000,000 and \$35,000,000.

On Aug. 19 Connecticut was hit by the worst flood in the history of eastern United States. The state had received 6 in. of rain from Hurricane "Connie" on Aug. 13 and then in 30 hours between Aug. 18 and 19 Hurricane "Diane" deposited 14 more inches of water on the already saturated ground and full rivers. The devastation caused by these usually placid streams, which became raging torrents, was tremendous. The governor requested Pres. Dwight D. Eisenhower to declare Connecticut a disaster area so that the state could qualify for federal relief funds, and the president at once complied. Less than two months later, on Oct. 16, the state was struck by a second flood, this time mostly in the shore towns in New Haven and Fairfield counties, although 39 towns were struck for a second time. Total damage from the first flood was estimated to be more than \$202,000,000 and from the second flood between 10% and 15% of this.

State officers for 1955 were: governor, Abraham A. Ribicoff (Dem.); lieutenant governor, Charles W. Jewett (Rep.); secretary of the state, Mildred P. Allen (Rep.); treasurer, John Ottaviano, Jr. (Rep.); comptroller, Fred R. Zeller (Rep.); attorney general, John J. Bracken (Rep.).

Education.—For the school year 1954-55 there were 736 public elementary schools with 9,477 teachers and 283,074 pupils; 42 junior high schools having 1,118 teachers and 21,432 pupils; 99 high schools having 3,417 teachers with 68,069 pupils; 126 parochial and other ecclesiastical schools having 1,360 teachers and 54,897 pupils; 85 private schools with 1,608 teachers and 19,255 pupils. There were 3 junior colleges with 1,107 students and 22 colleges and professional schools and 30,036 students. The state operates 4 teachers colleges (not included in the above) with an enrolment of 4,855 students. In addition there are 19 state vocational-technical or state-aided schools having 411 teachers and 16,020 students. Finis E. Engleman was commissioner of education.

Social Insurance and Assistance, Public Welfare and Related Programs.—During June 1955 a total of 16,826 persons received old-age assistance amounting to \$1,429,000; 16,915 dependent children received \$712,180; 333 blind persons received \$29,520; 1,923 disabled and infirm persons received \$206,565. There are in the state 2 U.S. veterans hospitals and one state hospital; 3 state hospitals for the mentally ill; 2 state institutions for mental defectives; and 4 state tuberculosis sanatoria.

Communications.—During the fiscal year July 1, 1954, to June 30, 1955, there were registered 963,838 motor vehicles of all classes and 1,090,234 drivers licensed. Motor vehicle fees amounted to \$16,073,433 and the gasoline tax was \$25,801,137. Telephone outlets increased to 968,114. Standard broadcasting stations numbered 25 and television stations 3. Railroad mileage was unchanged at 830.85 mi. There were 26 daily newspapers, 7 Sunday and 67 weeklies published in the state.

Banking and Finance.—The following is the financial condition of the state as reported by the treasurer: cash balance July 1, 1954, \$24,382,819.73; receipts \$1,024,257,682.99; payments, \$1,024,115,802.65; cash balance, June 30, 1955, \$24,524,700.07. Bonded debt, general obligations, \$80,920,000; self-liquidating obligations, \$207,545,000. Unemployment compensation fund, \$227,385,241.

The state bank commissioner reported that at the end of the fiscal year 53 state banks and trust companies had assets of \$1,090,000,000; 72 savings banks had assets of \$1,990,000,000; 47 trust departments of state banks and trust companies had assets of \$897,000,000; 30 building or loan associations had assets of \$127,000,000 and 7 industrial banks assets of \$10,000,000.

Agriculture.—The total cash receipts from farm marketings for 1954 as reported by the department of agriculture were \$168,233,000, as compared with \$182,436,000 the previous year. Income from livestock and livestock products was \$111,009,000, and from crops \$57,224,000.

Manufacturing.—Nonagricultural employment was at its highest point in two years on Oct. 15, 1955, according to the labour department. On

Table I.—Principal Crops of Connecticut

Crop	Indicated 1955	1954	Average, 1944-53
Corn, bu.	1,845,000	1,880,000	1,871,000
Oats, bu.	128,000	144,000	146,000
Hay, all, tons	415,000	425,000	436,000

Potatoes, bu.	2,162,000	3,140,000	2,957,000

Source: U.S. Department of Agriculture.

that date \$75,620 persons were employed, or 8,670 more than in September. Manufacturing industries accounted for 80% of the increase although some plants had not resumed production because of the floods. Employment in business and industry increased more than 20,000 during the year. Nonmanufacturing employment in October was 454,830, its highest for the year. Weekly earnings of factory production workers were \$81.37 as compared with \$73.57 in 1954. Weekly hours worked increased from 41.8 to 42.6, making the hourly rate \$1.91 as compared with \$1.82 the previous year.

Consumer Credit. During 1955, consumer credit developments in the United States were dominated by a strong upsurge in instalment credit extensions, particularly for the purpose of financing automobile purchases. Consumer credit extension contributed importantly to consumer buying power and to the record level of business activity. At the same time, however, questions were raised as to the later effect on business activity of the record rate of growth in instalment credit.

After reaching a peak of \$30,125,000,000 at the end of Dec. 1954, total consumer credit in the United States dropped seasonally for two months and then rose sharply to a new record of \$34,293,000,000 on Sept. 30, 1955. Total instalment credit,

which is by far the largest component of consumer credit, reached a peak of \$22,467,000,000 on Dec. 31, 1954, and by the end of Sept. 1955 reached a new high of \$26,700,000,000. The increase in consumer credit during the year ending Sept. 30, 1955, was \$5,440,000,000, of which \$4,760,000,000 was in instalment credit.

Instalment credit extended, seasonally adjusted, rose from an annual rate of \$27,800,000,000 in the second quarter of 1954 to an annual rate of \$38,400,000,000 in the third quarter of 1955, an increase of almost 40%. Instalment credit extensions on automobile paper constituted about half of the total extensions late in 1955 and gave rise to about two-thirds of the increase in the rate of instalment credit extensions. Meanwhile the annual rate of instalment credit repayments, seasonally adjusted, rose from \$28,700,000,000 in the second quarter of 1954 to \$32,100,000,000 in the third quarter of 1955, an increase of almost 20%.

The rise in the rate of instalment credit extended from 1954 to 1955 reflected largely rising sales of new automobiles, a higher ratio of new cars bought on time payments, and some easing of terms at least in the first half of the year. The rise in instalment credit repayments lags behind such an increase in extensions and easing of terms.

The importance of consumer credit to the business boom in 1955 may be seen in its relation to the automobile industry. The production and sale of 8,000,000 passenger automobiles would not have been accomplished without substantial expansion of consumer credit. In terms of consumer buying power, the importance of consumer credit may be seen in the fact that the excess of instalment credit extensions over repayments, both seasonally adjusted and at annual rates, amounted to \$6,300,000,000 in the third quarter of 1955. By comparison, the increase in total disposable personal income, in terms of seasonally adjusted annual rates, from the second to the third quarter of 1955 was \$4,900,000,000.

Yet these same considerations led to some concern about the future. Without further easing of terms to dangerous levels or without a further rise in credit extended, instalment credit repayments would inevitably catch up with instalment credit extensions and this impetus to consumer buying would be removed. Any drop in instalment credit extensions would hasten this process. The question was raised increasingly as to whether the increase in consumer credit, and in personal indebtedness generally, was at a sustainable rate. It was pointed out that in the three-year period from 1953 through 1955 total personal indebtedness, comprising both consumer credit and mortgage debt, rose about 46%, as compared with a rise in disposable income of around 13%.

While total consumer credit as measured in dollars rose sharply in 1955, so did the income of the people. The ratio of total consumer credit to total disposable personal income for the 12 months reached a new high of almost 13% at the end of Sept. 1955. While this was above the previous high ratios of 11.9% in Dec. 1954, 11.8% at the end of 1953, and 11% in Dec. 1940, the trend toward more use of instalment credit and greater importance of consumer durable goods over the years perhaps lessened the value of previous ratios as standards. Collection experiences of lending institutions were good and delinquencies were very low. Since midyear, finance companies and commercial banks had been resisting pressures for easier terms on automobiles. Federal reserve studies indicated that early in 1955 somewhat more than half the spending units owed some short-term consumer debt while the rest had no such debt. Liquid asset holdings exceeded the short-term debts of nearly one-third of the indebted consumers.

Of consumer spending units with instalment debt in early 1955, two-thirds had scheduled repayments equal to less than

one-fifth of their disposable income. Most of the remaining one-third had to make repayments amounting to between one-fifth and two-fifths of their disposable income. (See also FEDERAL RESERVE SYSTEM.) (J. K. L.)

Canada.—By midyear 1955 total consumer credit outstanding in Canada reached \$2,098,000,000. This was an increase from June 30, 1954, of \$208,000,000, or 11%.

Personal cash loans extended by the banks, small loan companies, etc., accounted for \$763,000,000 and showed the sharpest increase (\$92,000,000). Total instalment credit grew by only \$37,000,000 to \$844,000,000. The recession in the automobile business throughout the fall and winter of 1954-55 was responsible for the small growth in the credit extended by finance companies by \$17,000,000 to \$532,000,000. In fact, debt repayment to finance companies substantially exceeded new loans until the vigorous spring upturn of car sales boosted credit by \$59,000,000 in the March-June quarter.

Instalment credit on the books of retailers gained by \$200,000,000 to \$321,000,000, while the outstanding receivable on retailers' charge accounts increased by \$26,000,000 to \$491,000,000 over the 12-month period.

While estimated retail cash sales in the second quarter of 1955 of \$2,184,000,000 showed an increase of 5½% over the same 1954 period (and charge account sales at \$721,000,000, an increase of 4%), instalment sales of \$525,000,000 increased by 26%.

Expert opinion contended that the growth of consumer credit over the past few years had remained consistent with the growth of disposable and discretionary income, which enabled more Canadians to purchase more durable goods, notably cars, television sets and electrical home appliances on time payment.

The raising of the Bank of Canada's rediscount rate from 1½% to 2% in August and to 2¼% in October gave, however, the signal for a return from the easy money policies prevailing since early 1954 to more normal or tighter credit conditions. This policy change was expected to act as a brake against too rapid further expansion of consumer credit in the instalment sector. (R. R.R.)

Contract Bridge.

England won the world team championship in the match played in New York city in Jan. 1955. The English team was composed of Terence Reese, Adam Meredith, Boris Schapiro, Kenneth Konstam, Leslie Dodds and Jordanis Pavlides. The U.S. team, most of whose members had been on the championship team of 1954, were William Rosen and Milton Ellenby of Chicago, Ill., Lew Mathe and John Moran of Los Angeles, Calif., Clifford Bish of Detroit, Mich., and Alvin Roth of Washington, D.C.

At the conclusion of this match the English team was generally rated the best in the world, but in the annual European championships, played in Amsterdam in July with 13 national teams competing, France won and England was seventh. The teams and standings in the European tournament were: France, 19 victory points; Italy, 18; the Netherlands, 16; Switzerland, 15; Belgium, 14; Sweden, 13; Great Britain, 13; Austria, 12; Denmark, 9; Ireland, 8; Germany, 7; Norway, 7; Finland, 6.

The United States team championship was won by Lee Hazen, Samuel M. Stayman, Richard Kahn and Myron Field of New York city and Charles J. Solomon of Philadelphia, who with Charles Goren of Philadelphia were designated to meet the French team in the next world championship match, in Paris, Jan. 1956.

An invited team from the Regency club of New York city comprising Wingate Bixby, Constantin Plotz, Peter Leventhal and Ivan Wichfeld, played in the annual South American championships, held at Punta del Este, Uruguay, in March 1955, and took first place. Uruguay, Chile and Argentina were the other

teams that reached the final round.

Winners of the principal United States championships, other than the masters' team championship, were:

Life masters' individual: Norman Kay, Merchantville, N.J.

Masters' pairs: Paul Hodge, Abilene, Tex., and Ben Fain, Houston, Tex.

Open team-of-four championship (Harold S. Vanderbilt cup): Howard Schenken, B. Jay Becker and George Rapée, New York city; John R. Crawford and Sidney Silodor, Philadelphia, Pa.

There was little discernible change in methods of bidding, most players continuing to use the point-count valuation that had been favoured for five or more years; but there was some increase in the use of artificial or special bidding conventions, to a greater extent than at any time since the mid-1930s. More new books on bridge were published during 1955 than in any year since before World War II, one estimate placing the number of new books at 200.

(A. H. MD.)

Co-operatives. Steady gains in membership and business volume were registered in 1955 by co-operatives in many parts of the world. Their membership totalled an estimated 80,000,000 families in free lands where voluntary co-operation was possible, ranging to as high as 80% of the population in some of the smaller nations.

Credit and Marketing.—With 80% of the world's peoples in farming, growing attention was given in 1955 by free governments and co-operatives to the wider use of self-help principles in solving credit and marketing problems of small farmers, fishermen and other primary producers.

In India, where 70% of the population lives in rural villages, the federal government authorized in 1955 a broad program to be financed in part through state governments, for long-term credit and aid in marketing and processing techniques to the millions of small holders and handicraft workers now largely dependent on moneylenders and traders. Similar programs already had been launched in other Asian countries.

In the Republic of Korea (South), plans were started in 1955 for a U.S.-Korean program of credit and technical aid to rural co-operatives, at the behest of U.S. co-operatives.

In the United States, congress authorized the full retirement of government capital in the Banks for Cooperatives by farm co-operative borrowers. These organizations already had retired more than \$20,000,000 of the \$177,000,000 of government capital in these banks.

The U.S. government in 1954-55 also loaned the largest amount in any single fiscal year in its history, \$167,000,000, for rural electrification, mainly because of growing power use by the 4,500,000 members of 1,000 rural electric co-operatives. This brought the total loaned for this purpose to about \$3,000,000,000, of which about \$600,000,000 had been repaid with interest.

Credit unions in the U.S. and Canada—co-operative thrift and lending institutions for groups of employees, church members, union members, etc.—enjoyed continued rapid growth in 1954. Their memberships swelled to nearly 9,000,000 in North America alone, with the increased importance of credit in the consumer economy. This growth paralleled the movement for self-help credit in most other parts of the world.

Marketing of farm products by co-operatives continued a steady growth in the U.S. and most other countries. In the United States, 7,200 marketing co-ops graded, packed, processed and shipped more than \$9,000,000,000 worth of grain, dairy products, livestock, cotton, fresh produce and other goods for their more than 4,000,000 members during 1955. A national fruit and vegetable packing and shipping co-operative was formed.

Farm Purchasing.—About 3,300 farmer co-operatives, through state-wide and regional wholesaling organizations which

they owned, plus their own retail trade, did a total gross business of nearly \$3,000,000,000 in farm supplies in 1955. Some of them also did grain and other marketing for their members.

About 45% of this business volume was in feed processed in several hundred farmer-owned plants and in a few larger ones. Another 25% was in petroleum products, produced in 19 refineries owned, together with many oil wells, transportation and distribution facilities, by the farmers themselves. A number of larger regional co-operatives invested a total of at least \$4,000,000 in expanded refining facilities.

Expansion also took place in the 120 co-operative fertilizer plants through which farmers supplied themselves with more than \$350,000,000 of plant food in 1955. A less amount of business was done by U.S. farmers in the processing and distribution of seed; the purchase of farm machinery, automotive supplies, hardware, groceries, paint, lumber, appliances and other supplies; and the manufacture of milking machine equipment and water heaters.

Farm supply purchasing on a less extensive scale was done by rural dwellers in Canada, western Europe, Great Britain, Australia, Latin America and in Asia.

Insurance.—Co-operative or mutual insurance societies in which policyholders participate, and by which investments are made with direct concern to the interests of the policyholders, enjoyed continued growth in 1955. One such society, the second largest insurance firm in Great Britain, set up a U.S. subsidiary on whose board were represented leaders of the Farm Bureau Insurance companies of Ohio (now Nationwide Insurance) with 3,000,000 U.S. members.

Another rapidly-growing co-operative type insurance firm was the CUNA (Credit Union National association) Mutual Insurance society, for credit unions and their members in the U.S. and Canada. Firms of this type in these two countries alone totalled about \$300,000,000 in assets in 1955, and served more than 8,000,000 policyholders, not counting the members of CUNA-insured credit unions. The majority of these firms were not large but were organized by farmers on a county-wide basis for protection against fire, storm, crop and other losses.

Health.—In 1955 there was a steady growth and considerable interest among members of unions and other citizen bodies in co-operative and group health plans owned and controlled by their members. Such plans were serving more than 1,500,000 U.S. and Canadian families in 1955 with a wide variety of either health insurance or direct medical or hospital service, or a combination of these. Through them, families prepaid the cost of both preventative and curative health care. Where the plan itself provided for direct service to families, teams of doctors were on hand to consult on members' needs. Nearly 500,000 New Yorkers owned the Health Insurance Plan of Greater New York, which contracted with 1,000 doctors working in teams in 29 centres.

Consumer Goods.—Continued recovery of western European economies in 1955 enabled consumer goods co-operatives to improve further their merchandising methods. Scandinavian consumer co-operatives continued as price and quality leaders, and British and Scottish societies were among the largest businesses in Great Britain. Rapid expansion of western German co-operatives continued, and French, Dutch, Belgian and Italian co-operatives did thriving business.

In the United States, most of the larger consumer goods societies expanded into branch stores and shopping centres, using mass merchandising methods more extensively than heretofore. Supermarkets and other co-operatives in the Washington, D.C., area did a \$15,000,000 business volume in 1955. In Akron, O., a co-operative owned largely by union members continued as the largest retail business, and a pattern of modern shopping

centres in the north central states was launched by Central Co-operative Wholesale, largest of the consumer organizations as well as the oldest. Total consumer goods business among U.S. co-operatives totalled well over \$125,000,000 in 1955.

Housing.—Great interest in co-operative methods of home ownership grew world-wide in 1955—in Asia, Latin America, Australia and Canada, as well as in the established co-operative housing programs in the Scandinavian countries, in Israel and in western Europe.

United States housing co-operatives were aided by congress' authorization of government loan funds, and by expansion and liberalization of federal mortgage guarantee provisions. More than 150 bona fide co-operative home and apartment ownership projects existed in 1955, housing about 50,000 families. Of these, a large majority were in New York city. A large union of garment workers, for example, financed with its members the construction of nearly 1,700 apartment units and a shopping centre on 12 ac. of former slum sites on New York's east side.

Other Service Co-operatives.—Co-operative techniques were used in 1955, as in past years, to reduce costs and expand quality of many services throughout the world—for recreation, for child care, even for burial at low cost for members of funeral co-operatives. On U.S. and Canadian college campuses, for example, more than 500 dormitory and eating co-operatives enabled about 60,000 students to reduce costs and gain knowledge of democratic methods in a friendly home atmosphere.

Exchange of Information.—Through visits, exchange of technical knowledge and personnel, often with the help of their various governments and the United Nations, as well as through the International Cooperative Alliance, co-operatives throughout the world expanded their exchange programs in 1955. The best-known co-operative in the world, CARE (Cooperative for American Remittances Everywhere), ended its program of U.S. citizens' aid to European recovery, but continued its European offices so CARE packages could flow from Europe elsewhere. It also expanded its raising of funds for technical aid (plows, books, tools) for needy families and community development in many parts of the world.

The International Cooperative Petroleum association showed continued growth as a medium through which oil co-operatives in a number of nations could exchange products and information. (See also FARM CREDIT SYSTEM.) (P. DE.)

Copper. World output of copper in 1954 was estimated at 3,100,000 short tons, according to the U.S. bureau of mines. World production of mine output by the 12 principal producers is given in Table I, and comparative data on mine and smelter copper is shown in the article on MINERAL AND METAL PRODUCTION AND PRICES.

United States.—Salient data on the copper industry in the U.S. are presented in Tables II and III, based on the U.S. bureau of mines reports. In 1954, copper output declined 10%, chiefly because of strikes. Four new large operations reached production stage in 1954—three open-pit mines in Arizona and

a large underground mine in Michigan. Consumption of refined copper continued large for a peacetime year but was about 20% below the high rate of 1953. Imports were at a lower rate in 1954 but exports of refined copper, the main type exported, were double those in 1953. Exports were made chiefly to Europe.

In the first eight months of 1955, output of mine copper was 630,000 short tons. Smelter output was 686,452 tons: 630,000 tons from domestic and 56,340 tons from foreign copper.

Canada.—Output from several new prospects explored and developed in 1954 was expected in 1955, notably Gaspe Copper mines and Campbell Chibougamau.

Peru.—In Jan. 1955, the American Smelting & Refining Co. announced completion of negotiations with three other companies for financing (with U.S. Export-Import bank aid) the Toquepala copper project in southern Peru, eventually expected to mine 30,000 tons of ore a day. During 1955 development went forward. (See also FOREIGN INVESTMENTS.)

(F. E. H.; B. B. M.)

Corn. Until August the U.S. 1955 corn crop promised 3,478,000,000 bu., second largest on record, nearly one-fifth larger than that of 1954 and the highest average per-acre yield on record. Then drought blasted the crop in the western half of the corn belt, resulting in a 10% decline to an indicated 3,182,870,000 bu. (fifth largest), but nevertheless larger than the 2,964,639,000 bu. of 1954 or the average for 1944-53 (3,080,000 bu.).

115,000 bu.).

Acreage indicated in July for harvest was 80,765,000 ac. as compared with 79,875,000 ac. harvested in 1954 and an average of 84,675,000 ac. harvested 1944-53. Yields were indicated at 39.4 bu. per acre, slightly higher than the 37.1 bu. of 1954 and an average of 36.4 bu. per acre for the decade 1944-53.

Prices in 1955 remained well below the official average support price of \$1.62 per bushel (90% of parity) on the 1954 crop and \$1.58 per bushel (87% of parity) on the 1955 crop. The average price to farmers in mid-October was \$1.14 per bushel as compared with \$1.45 per bushel at the same date in 1954. The record carry-over on Oct. 1, 1955, was about 1,050,000,000 bu. as compared with 920,000,000 bu. in 1954. Of this reserve, 880,769,000 bu., valued at \$1,455,521,000, were under the price support program of the Commodity Credit corporation as of June 30, 1955; comparable data for the previous year were 775,268,000 bu. valued at \$1,235,991,000. Export of U.S. corn in 1954-55 was only 76,509,000 bu. valued at \$128,981,000, as compared with 108,251,000 bu. valued at \$186,255,000 in the previous year.

World corn exports in 1954-55, largely to Europe, were about 4,806,000 long tons as compared with 5,149,000 tons in 1953-54. Argentina's exports increased as a result of favourable production in 1954, but the Danube basin supplies did not return to their former markets, and world exports remained at about half the prewar average of 10,039,000 tons.

The Argentine crop, harvested in the spring of 1955, was estimated at only 110,000,000 bu. as compared with 175,000,000 bu. in 1954, giving a 1955-56 supply 36% less than that of 1954-55 and indicating exports, prior to May 1956, definitely smaller than the 79,000,000 bu. exported in 1954-55.

The preliminary outlook was for a 1955-56 record world corn crop of about 6,060,000,000 bu., about 10% larger than the 1954-55 crop. (J. K. R.)

Costa Rica.

A Central American republic, Costa Rica is located between Nicaragua and Panamá. Area, 51,965 sq.mi.; pop. (1950 census), 800,875; (1955 official est.), 1,042,000, classified as about 80% white, 16% mixed, 3% Negro and less than 1% Indian. The capital is San José (1950 pop.) 136,909; other principal cities are Alajuela, 13,903; Cartago, 22,944; Guadalupe, 8,452; Heredia, 11,967; Limón, 11,310; and Puntarenas, 13,272. Language: Spanish. Religion: predominantly Roman Catholic. President in 1955: José Figueres.

History.—Early in Jan. 1955, a group of rebels headed by former President Rafael Calderón-Guardia and the son of another former president, Teodoro Picado, moved south from the Nicaraguan border to take Villa Quesada, a small town on the Pan-American highway. In response to a Costa Rican request, the Organization of American States sent to Costa Rica a five-man investigating commission headed by Mexican diplomat Luis Quintanilla. The commission, reporting that "a substantial part of the rebel war material was introduced over the Nicaraguan

border," recommended that the United States sell four P-51 Mustangs to the Costa Rican government. The United States immediately sent the four fighters, reportedly selling them for a token sum.

As soon as the Organization of American States began investigating the charges, Nicaraguan President Anastasio Somoza ceased to aid the rebels who, shut off from supplies and from air support because of the action of the four fighters, fled to Nicaragua where they were interned. Bitter fighting occurred near the towns of Liberia, Santa Rosa, La Cruz and Puerto Soley, but the rebels were no match for the superior numbers of the popularly supported constitutional forces.

After meeting with United States Vice-President Richard M. Nixon during the course of Nixon's Central American tour, Figueres said that he was willing to go more than half way in resolving any differences with Nicaragua. Nixon also met with opposition leader Otilio Ulate Blanco.

Realizing that it was perhaps not strong enough to stand alone in its antidictator policy, Costa Rica moved to re-establish relations with the Dominican Republic and with Venezuela.

During the year the government-sponsored Federación de Trabajadores Bananeros joined the communist-dominated Federación de Obreros Bananeros in a strike against the United Fruit company for a 40% wage increase. The strike was terminated when the company agreed to moderate raises in a new three-year contract. The company also agreed to improve housing and not to discharge union leaders except for legal breach of contract.

A 21-kilometer link in the Pan-American highway was finished during the year, permitting automobile travel between Guatemala City and San José. In July the Export-Import Bank of Washington agreed to provide a loan of \$9,000,000 to pave the Costa Rican section of the Pan-American highway.

On the economic scene, Costa Rica, seeking eligibility for loans from the International Bank for Reconstruction and Development, reached an agreement with foreign bondholders to liquidate a \$3,560,000 debt outstanding since 1871. To be eligi-

"SI SENOR! WE'RE AT WAR!" a 1955 Cartoon by Dobbins of the Boston Post

ble. Costa Rica had still to clear up a defaulted French debt. Foreign exchange reserves rose by \$8,200,000 in 1955 to a total of \$28,180,000, largely because of a bumper coffee crop. (See also NICARAGUA; ORGANIZATION OF AMERICAN STATES.)

(R. HN.)

Education.—In 1951 there were 1,139 public and private primary schools with 4,821 teachers and 116,157 pupils. In 1950 there were 8 public secondary schools, 16 private schools and 7 technical schools. University education was available at the University of Costa Rica. According to the 1950 census, 21.2% of those 10 years of age and over were illiterate.

Finance.—The monetary unit is the colon, valued in 1955 at 17.64 cents U.S. currency, official rate, and at 15.04 cents, controlled free rate. The national budget for 1955 balanced revenue and expenditure initially at 229,963,100 colones. Actual revenue in 1954 was 233,467,081 colones; expenditure, 219,226,620 colones. The public debt on June 30, 1955, was 351,671,000 colones, of which 130,028,000 colones represented the external debt. Currency in circulation in July 1955 totalled 136,355,000 colones. The U.S. dept. of commerce estimated U.S. direct investments in 1950 at \$60,000,000. The cost-of-living index (San José) stood at 130 in Aug. 1955 (1948=100).

Trade and Communications.—Exports in 1954 amounted to \$80,960,669 (subject to adjustment for revaluation of banana exports; 1953 as adjusted: \$80,149,254). Imports in 1954 totalled \$80,653,614. Chief exports were coffee (43%), bananas (40%), cacao (10%) and abacá (2%). Leading customers were the U.S. (59%), Germany (18%), Canada (9%), the Netherlands (4%) and Panamá (2%); leading suppliers, the U.S. (58%), Germany (10%), the U.K. (7%), the Netherlands Antilles (4%) and Canada (3%).

Railway trackage (1954) included 416 mi. of public railway and 388 mi. of private railway. In 1951 there were 930 mi. of all-weather roads and 3,725 mi. of dirt roads; of the 413 mi. of the Inter-American highway in Costa Rica, 60 mi. were paved in mid-1954, 226 mi. were all-weather and 147 mi. impassable. Motor vehicle registration (Jan. 1, 1955) included 8,450 automobiles, 4,880 trucks and 947 buses. Telephones (Jan. 1, 1954) numbered 10,600, none automatic. In 1954 there were 55 airfields, 42 of which had daily scheduled service.

Agriculture.—Coffee production in the 1954-55 season totalled 564,000 bags of 132 lb. each; exports totalled 391,000 bags in 1954. Other exports in 1954 included bananas 10,115,975 stems (about 15,600,000 count bunches) and abacá 3,052 metric tons. Production in the 1953-54 season included cacao 13,448,000 lb.; maize 79,000 metric tons; rice 27,000 tons; beans 19,000 tons; sugar 64,000 tons. The 1950 census showed 592,402 cattle, 112,156 hogs and 77,335 horses.

Manufactures.—In 1950 there were 1,267 manufacturing establishments with annual production valued at \$78,251,000. Most important were food and kindred products (26.8%), printing and publishing (23.4%) and apparel and related products (22.2%). (J. W. Mw.)

Cost of Living: see BUSINESS REVIEW; PRICES.

Cotton. United States Cotton Production.—The U.S. cotton surplus increased in 1955 though rigid federal acreage allotments and marketing quotas were again applied. Allotted acreage was set at about 18,200,000 ac., or 15% below 1954; the 17,096,000 ac. in cultivation to cotton on July 1 were the least since records began in 1909, 6% less than the 1955 allotment, 14% less than the 19,791,000 ac. cultivated in July 1954 and well below the 1944-53 average of 22,763,000 ac. There was, however, a new record high per-acre yield of cotton

Table I.—U.S. Cotton Production by Leading States

State	(in 000 500-lb. bales)		Average, 1944-53
	Indicated 1955	1954	
Texas	4,250	3,940	3,388
Mississippi	2,000	1,571	1,693
Arkansas	1,160	1,351	1,386
California	1,250	1,487	1,048
Alabama	1,045	728	908
Georgia	700	612	695
Arizona	685	911	481
Tennessee	615	548	565
Louisiana	590	572	591
South Carolina	575	501	692
Oklahoma	450	293	390
Missouri	400	450	358
North Carolina	355	364	492
New Mexico	270	316	217
Other states	48	52	47

lint of 431 lb., 90 lb. more than the record set in 1954 and 152 lb. above average. The indicated 14,843,000 bales (fully 4,800,000 bales more than the official goal) was moderately larger than the 13,696,000 bales of 1954 and well in excess of the 1944-53 average of 12,952,000 bales. Per-acre yields of the long-staple American-Egyptian cotton were reduced to 540 lb. per acre as compared with 589 lb. in 1954; the 1944-53 average was only 357 lb. per acre. The indicated crop of 46,200 bales

was larger than the 42,100 bales of 1954 and much larger than the 29,600-bale average for 1944-53.

Prices remained close to the official support price average of 31.58 cents per pound on the 1954 crop and 31.70 cents per pound on the 1955 crop until late in the harvest period, then broke rather sharply 2 or 3 cents below the support. The average support price on 1955 crop extra long staple was 55.20 cents per pound as compared with 65.25 cents for the 1954 crop.

Contrary to earlier anticipation of a decrease, the cotton carry-over at the beginning of the 1955 harvest was 11,100,000 bales, 1,400,000 bales more than in 1954 and the largest since Aug. 1, 1945. Approximately 8,134,000 bales of this total carry-over were included in the price support operations of the Commodity Credit corporation, hence were not available to the free market unless the price should rise.

The export of U.S. cotton in 1954-55 was only 3,585,000 bales, an 8% decrease as compared with the previous year and far below the 4,500,000 bales officially estimated at the beginning of the season. Exports to Japan declined sharply in 1954-55, to 678,000 bales (1,005,000 in 1953-54); France (416,000 bales), Germany (350,000 bales) and Italy (249,000 bales) showed more moderate declines. Exports to Canada (307,000 bales) and to the Republic of Korea (170,000 bales) were sharply increased, whereas the U.K. continued at about 421,000 bales.

Lesser exports and decreased domestic consumption (8,800,000 bales against 9,200,000 bales estimated in Oct. 1954) resulted in the largest carry-over since 1945—11,100,000 bales on Aug. 1, 1955. The carry-over, added to the new crop, gave a supply of about 26,000,000 bales against which it appeared that disappearance might total 13,000,000 bales, leaving a new record carry-over probable in 1956.

Understandably, the cotton situation received much high level attention in 1955. After what was described as "protracted wrangle" it was announced that the government would make a move before Jan. 1, 1956, to cut prices on exports, but after that date as many as 1,000,000 bales of the surplus might be offered at competitive prices.

World Cotton Production and Trade.—World cotton production of 1955-56 was estimated at a new record high of 40,800,000 bales, or about 7% more than the 38,410,000 bales of 1954-55. (See Table II.) Egyptian farmers planted an estimate

Table II.—Cotton Production of the Principal Producing Countries
(in 000 500-lb. bales)

Country	1955*	1954	Average, 1945-49	Average, 1935-49
United States	14,843	13,696	12,104	13,140
India	4,200	4,250	2,304	5,340
China (including Manchuria)		3,100	1,939	2,850
Mexico	2,050	1,780	577	330
Brazil		1,630	1,352	1,950
Egypt	1,806	1,598	1,456	1,890
Pakistan	1,400	1,300	1,024

*Indicated. †Includes Pakistan.

1,883,000 ac., about 15% more than in 1954 and 39% more than in 1953 but 10% less than the postwar peak planting of 2,050,000 ac. in 1951. Minimum guaranteed prices to Egyptian growers for the 1955 crop ranged from about 32 cents per pound for Ashmouni type to about 40 cents per pound for Karnak type. Egypt exported only 660,000 bales during the first seven months of the crop year 1954-55, as compared with 863,000 bales in the comparable period of the previous year.

The International Cotton Advisory committee met in Paris in June. It indicated that the world surplus of cotton had resulted from postwar economic development, technical advances in production and the continuing high level of cotton prices. It initiated a study to ascertain governmental policies affecting the consumption of cotton and competing fibres. Its next meet-

was to be in Washington, D.C., probably in May 1956.

Linters.—The 1955-56 U.S. supply of cotton linters, including a new crop of at least 1,700,000 bales and imports of 200,000 bales, was estimated at 3,400,000 bales, about the same as in 1954-55. Probable usage was estimated at 1,700,000 bales, leaving a probable carry-over of 1,700,000 bales at year's end. Exports, mostly to Germany, U.K., France and Japan, during 1954-55 amounted to 310,000 bales, against imports of 166,000 bales, mostly from Mexico, the U.S.S.R. and Brazil. Prices declined as much as one-fifth during 1954-55, to about 8.2 cents per pound for No. 2 grade and 9.75 cents per pound for purified linters.

Cottonseed.—Production of this oilseed was indicated at 3,119,000 tons as compared with 5,720,000 tons in 1954. Official price support on the 1955 crop was a loan of \$46 per ton as compared with \$54 per ton in 1954, or purchase at \$42 per ton (\$50 in 1954). (See also TEXTILE INDUSTRY.) (J. K. R.)

Crime. **United States.**—Crime-reporting procedures in the U.S. distinguish between part i and part ii offenses. Categories of crimes that are most likely to be known to the police are included in the first group. Since most part ii crimes become known only when arrests are made, crime statistics for these offenses on a national basis are not available. The number of arrests cannot be taken as a measure of the amount of part ii crime. Neither is there assurance that the number of persons arrested for any part ii offense will remain in constant proportion to the total number of crimes in that category; in consequence, changes in arrest rates cannot be taken as evidence of similar changes in crime rates.

The first six months of 1955 experienced a reduction in the total number of part i crimes as compared with the same period in 1954, thus engendering hope that the upward crime trend of the past seven years had been checked if not reversed. The number of crimes reported was fewer than during the same period in 1954 in five classes (murder and nonnegligent manslaughter, manslaughter by negligence, robbery, burglary and auto theft) and greater in three (rape, aggravated assault and larceny). The significance of the reduction in the total number of these crimes is emphasized by the fact that it occurred during a period of steadily increasing population.

Per Cent Change in Estimated Number of Part i Crimes Known to Police in 1954 Compared With Number in 1953, and in First Six Months of 1955 Compared With First Half of 1954

Part i crimes	Per cent change	
	1953-54	First half 1954-55
Murder and nonnegligent manslaughter	-3.8	-3.8
Manslaughter by negligence	-4.9	-0.3
Rape	+0.7	+6.3
Robbery	+6.8	-15.1
Aggravated assault	+1.0	+1.1
Burglary (breaking or entering)	+8.4	-3.3
Larceny (theft)	+5.8	+0.9
Auto theft	-4.7	-0.2
Total	+5.0	-0.7

The changes in arrest rates in certain classes of crimes during the past 15 years challenge sociological explanation. For

example, while the frequency of crimes against property showed a disproportionate increase, the rate of arrests for buying, receiving and possessing stolen property decreased 19%. Other arrest rates also decreased: prostitution 55%, gambling 13% and vagrancy 10%. In vivid contrast, sharp increases in the relative frequency of arrests were noted in other categories: narcotic drug law violations, 368%; carrying and possessing weapons, 117%; driving while intoxicated, 85%; sex offenses (except rape and prostitution), 61%.

That crime frequency is intimately related to population concentration was once more revealed by 1955 statistics. The average city in each population group had higher part i crime rates, with almost no exceptions, than the average in any group of smaller communities. Homicides and rapes were twice, robberies were four times and aggravated assaults were nearly three times as frequent, per unit population, in cities of more than 100,000 population as in smaller cities. On the same basis, auto thefts were 124%, burglaries 65% and larcenies 12% more numerous in these large cities than in the smaller ones.

The crime frequency of cities varied greatly, influenced not only by their size but also by their geographical location. The New England states as a group enjoyed a lower urban rate in each category of part i crimes than any other geographical division. For example, the east south central states (Alabama, Kentucky, Mississippi and Tennessee) had a murder and non-negligent manslaughter rate and the south Atlantic states (West Virginia, District of Columbia and the states on the Atlantic south of Pennsylvania) had an aggravated assault rate both of which were 13 times greater than those of New England. The combined crime rates of the three Pacific states also exceeded those of New England. The relative frequency of robbery was five times, of larceny three times and of burglary and auto theft twice as great as in New England.

The value of property reported stolen in 1954 in 421 cities of more than 25,000 and having a total population of 56,300,000 by the census of 1950 amounted to \$221,800,000; \$114,500,000 of this sum represented stolen automobiles of which 93.3% were recovered. Average property losses were less in 1954 than in 1953: robbery \$219 compared with \$235; burglary \$176, a decrease of \$4; auto theft \$963 compared with \$1,060 in 1953.

Statutory rapes increased 8.9% in 1954, bringing the number to substantially the same as for forcible rape. The majority of robberies were on streets and highways; fewer than 0.3% were against banks although the number of bank robberies increased 12 to a total of 124. A total of 47% of residence burglaries were committed during the daytime. Only 1.2% of all thefts were accomplished by picking pockets; this offense decreased 3% from 1953.

While 94.5% of all part i crimes were against property (robbery, burglary, larceny, auto theft), only 64.3% of persons arrested for part i offenses were charged with property crimes. These figures emphasize the fact that crimes against the person (criminal homicide and felonious assault) are more frequently cleared by arrest than crimes against property (76.8% as compared with 24.6%). Robbery, being similar to personal crimes in that the victim is present, had a higher clearance rate than other property crimes (40.6%).

Eleven per cent of arrested persons were women. The most frequent charge lodged against both men and women was drunkenness—43.7% of all men and 29.6% of all women arrested.

News accounts of assaults by youths that tended to lead to the conclusion that youth had gone on a rampage were only partly substantiated by arrest statistics. The percentage of arrested persons in each age group charged with aggravated assault decreased from 1953 to 1954: under 18 by 7.06%; under 21 by 3.74%; under 25 by 2.40%; all ages by 1.70%. The per cent of

arrested persons in the youth age groups charged with other assaults increased in the face of a decline of 17.48% for all ages. The increases were: 3.35% for those under 18; 3.83% for those under 21; 2.74% for those under 25.

Cities of more than 25,000 population experienced a 2.8% increase in the arrests of persons under 18 years of age while the total arrests decreased 0.5%. Arrests of youngsters in this age group remained almost unchanged in smaller cities. This age group accounted for 9.7% of all arrests; for 57.6% of all arrests for auto thefts; for 49.0% of all burglary arrests; and for 43.6% of all larceny arrests. More than 51% of arrests for property crimes were of persons under 21 years of age, while for crimes against the person, this age group represented only 14% of the arrests. (See also FEDERAL BUREAU OF INVESTIGATION; JUVENILE DELINQUENCY; LAW; SECRET SERVICE, U.S.)

(O. W. W.)

International.—During the year two important international conferences were held. The first UN congress on the prevention of crime and the treatment of offenders took place in August at Geneva, Switz., and was concerned mainly with penal administration, including also a section on juvenile delinquency. The third conference of the International Society of Criminology was held in London, the central theme being the subject of recidivism. It was attended by experts in different disciplines from countries in Europe, Asia and America.

England and Wales.—A further decrease in the total of indictable offenses occurred in 1954. The total figure was now lower than in 1945 though still appreciably higher than in 1938. The decrease was particularly noticeable in offenses by children under 14.

	1954	1945	1938
Total of indictable offenses known to the police . . .	434,327	478,394	283,220
Larceny	285,199	323,310	199,951
Receiving	6,468	10,132	3,433
Sexual Offenses	16,096	8,546	5,018
Violence against the person	7,506	4,743	2,721

TENEMENT DWELLERS of New York city watching police in a two-hour gun battle with August Robles, suspected of murder, Feb. 20, 1955

Although the rise in fraud and false pretenses which had continued steadily since 1945 was checked, there was a further rise in sexual offenses and violence against the person. The proportion of offenses cleared up by the police was 49.2% and continued to approach the pre-World War II figure of 50.1%. Whereas there was a decrease of 8.1% in the number found guilty of indictable offenses, the corresponding figure for non-indictable offenses increased by 5.5%. Broken down into age groups, 19% were under 14; 14% between 14 and 17; 11% between 17 and 21; 21% between 21 and 30; and 35% were over 30.

As in 1953, larceny, breaking and entering and receiving accounted for 83% of people found guilty of indictable offenses. The total number of findings of guilt for 100 different persons found guilty had risen since 1950. The increase in the number of sex offenders took place mainly in the 17-21 age group, and in violence against the person in the age group 14 to 30. While there was a slight decrease in the number of murders from 19 in 1953 to 25 in 1954 (in 1938 the number was 23) the figure for attempted murder showed a marked increase from 25 to 15 in 1938).

The peak age for crime in 1954 was 14 in the case of both males and females. Though this represented little change from the prewar figure for males, in the case of females the peak had decreased from 19 which was the peak age in 1938. (See also POLICE; PRISONS.)

(J. C. SR.)

Crockett, Davy

U.S. historico-legendary figure whose prototype was the frontiersman David Crockett (1786-1836), of whom a biographical notice will be found in *Encyclopædia Britannica*.

He was the central figure of a national fad among children of the United States during 1955, which began with a series of colour television films by Walt Disney, starring Fess Parker as Davy, featuring a catchy song, "The Ballad of Davy Crockett" (Tenn. Blackburn and G. Bruns). Recorded by Bill Hayes, the son

THE BATTLE OF THE ALAMO re-enacted by young Davy Crocketts in 1955

became a national hit and gave further momentum to the Crockett craze. Soon articles of children's clothes—especially Crockett coonskin caps and leather jackets—appeared in the nation's stores, followed by dozens of other items ranging from soap to bedspreads and balloons to bicycles—all avidly purchased by children and their parents. By mid-May 1955 sales of Crockett merchandise had reached an estimated \$100,000,000 and were expected to total perhaps twice that amount by the end of the year. New editions of David Crockett's autobiography (1834) appeared, with advance sales in the millions. Sheet music sales of the "Ballad" passed the 500,000 mark, and Disney remade his series of TV films into a full-length motion picture that was viewed by capacity crowds. By the fall of 1955, however, the Crockett fad had waned.

Crude Oil: see PETROLEUM.

Cuba. The republic of Cuba occupies the entire island which lies between 20° and 25° N. lat. and 74° and 85° W. long. The main island and numerous small islands under Cuban sovereignty have an aggregate area of 44,217 sq.mi. The population (census, Jan. 28, 1953, revised figures of June 1954) was 5,823,187. Havana, with a population of 1,157,445 (1953 census), is the capital and largest city. Other large cities and their populations (1953) are Bayamo 143,617, Camagüey 204,154, Guantánamo 125,731, Holguín 226,571, Morón 105,131, Palma Soriano 100,157, Sancti Spíritus 115,484, Santiago de Cuba 166,189, and Victoria de las Tunas 131,183.

History.—Fulgencio Batista, elected president on Nov. 1, 1954, was inaugurated on Feb. 24, 1955, when congress began its first constitutional session of the year. A program of economic rehabilitation of the nation got under way, the problem of sugar policy being dealt with first. Cuba's economic life largely revolves around sugar; the purchasing power of the Cuban people as a whole rises and falls with the consumption of Cuba's primary product. During 1955 there were repeated threats to cut down Cuba's share in the growth of the market for sugar in the United States, even in advance of the expiration date of the sugar act under which all quotas are fixed (Dec. 31, 1956). These threats had a disquieting effect upon sugar production,

already drastically cut back by the Cuban government in 1954. Exportation of sugar was increased over that of 1954, largely by reason of unexpected underproduction in the U.S.S.R. and several Asiatic countries, which lie outside the jurisdiction of the World Sugar agreement, under which Cuba can count upon 42% of the sector of the world market subject to that agreement. Nearly 500,000 tons were sent to the Soviet Union, 138,000 tons to Japan and substantial tonnage to India and other areas not normally importing sugar. Because of this circumstance, a somewhat better tone developed in the business world during the second half of 1955.

On Jan. 27 there was promulgated law-decree 1589 of 1954, which set up the Bank of Economic and Social Development. This took the place of the Fund for Economic and Social Development, established in May 1954. The bank was to be autonomous, with a capital of \$15,000,000. It had a four-year program of furnishing \$350,000,000 in long-term, medium-term and short-term credit to Cuban producers of all categories, designed to encourage establishment of new industries and to accelerate diversification of the nation's economy. It was designed to relieve the national government of the necessity of dealing directly with every economic emergency which might arise.

The government felt strong enough to invite all political exiles and fugitives to return home, under full guarantees. Former Pres. Carlos Prío Socarrás returned quietly. Political tranquility enabled the president to get through the year with a minimum of friction in congress, and no retirements from his cabinet except one, that of Carlos Saladrigas, secretary of state for foreign relations, because of illness.

When the second session of congress began, on Sept. 19, the need for extra revenue was such as to result in a request for a tax on capital gains and a new stamp tax. The capital gains tax ranged from ½ of 1% on a gain of \$10,000 to a maximum of 18% on capital gains in excess of \$1,000,000.

A third oil refinery was begun in Santiago, destined by the end of the year to raise to 65,000 bbl. the aggregate daily production of all three refineries.

Severe damage was caused by a hurricane in eastern Cuba, around Baracoa, in September. (C. E. Mc.)

Education.—In the school year 1952-53 public primary schools had an enrolment of 634,924 and 23,163 teachers; private schools had 98,724 students. There were 21 institutes for secondary education with 26,413 students; 10 normal schools with 1,817 students; and 45 other schools with 11,545 students. University education was available at the University of Havana (18,379 students), Oriente university (Santiago de Cuba) (1,256), Santa Clara university (Santa Clara) (767) and the Catholic university of Villanova (Havana) (523).

Finance.—The monetary unit is the peso, officially pegged at par with the U.S. dollar. The budget for the fiscal year 1954-55 (July 1-June 30) was placed initially at \$311,414,817. Total revenues in the calendar year 1954 were \$292,883,120. On June 30, 1955, the consolidated national debt amounted to \$463,401,800. Currency in circulation (May 31, 1955) was \$395,000,000; demand deposits, \$491,000,000. The U.S. department of commerce estimated U.S. direct investments in 1954 at \$713,000,000, of which public utility investments accounted for \$303,000,000. The cost-of-living index (food, Havana) stood at 88 in May 1955 (1948=100). National income was estimated at \$1,715,000,000 in 1954.

Trade and Communications.—Exports in 1954 totalled \$539,047,690; imports (estimated), \$470,000,000 (1953: \$489,733,278). The chief exports in 1954 were sugar (80%), tobacco and products (8%), nickel (2%) and molasses (2%); leading customers, the U.S. (73%), India (4%), Japan (4%), the U.K. (4%) and French Morocco (2%). Leading imports in 1953 were foodstuffs and beverages (33%), machinery and apparatus (17%), stone, earth, ore, glass and clay products (11%) and metals and manufactures (9%); leading suppliers, the U.S. (76%), the Netherlands Antilles (3%) and India (3%).

Railways (1949) included 3,017 mi. of main line, 660 mi. of sidings and yards and 7,870 mi. of industrial trackage. Roads (1949) included 1,720 mi. of paved highways and 600 mi. of improved highways. On Jan. 1, 1955, there were 112,154 privately owned automobiles, 39,290 trucks and 4,735 buses. Telephones (Jan. 1, 1954) numbered 141,055, 89.8% of which were automatic and 74% of which were located in Havana.

Agriculture.—Production of sugar in the 1954-55 season, limited by government decree, was 4,924,200 short tons; that of blackstrap molasses, 197,752,073 gal.; high-test molasses, 231,482,809 gal. Production es-

timates for other crops in 1954-55 included rice (rough) 340,000,000 lb.; tobacco (1954) 110,700,000 lb.; coffee 643,000 bags of 132 lb. each; cacao 5,578,000 lb.; oranges 1,625,000 boxes of 70 lb. each; grapefruit 190,000 boxes of 80 lb. each; henequen (1954) 32,703,000 lb. In 1951-52 there were an estimated 4,033,000 cattle, 1,286,000 pigs and 194,000 sheep.

Manufactures.—Production in 1954 included cement 420,000 metric tons; rum 10,756,954 l.; beer 120,212,398 l.; alcohol 174,150,926 l. Sales of electric energy by the one large company (representing about 90% of total production) were 928,000,000 kw.hr.

Minerals.—Copper production totalled 16,773 short tons in 1954. Exports included nickel 19,318 metric tons; manganese ore 234,710 tons; iron ore 76,392 tons; chrome ore 8,945 tons. (J. W. Mw.)

Curaçao: see NETHERLANDS ANTILLES.

Curling. The Gordon International medal was returned to Canada when rinks representing the Canadian branch of the Royal Caledonian Curling club defeated members of the Grand National Curling club of America in the 1955 competition. The dominion players won by 603 to 373 at Montreal, Que., for their 40th victory in this annual rivalry. The United States had been triumphant in 20 of the matches. The American season was featured by the visit of 20 Scottish curlers from the Royal Caledonian club who engaged in a series of exhibitions and matches during a tour that covered 10,000 mi. Among the highlights of their trip was a 166-89 victory over Grand National representatives from the metropolitan New York area. The 16-match series was played Feb. 6-7 at the St. Andrew's Golf club at Mount Hope, N.Y. Willie Piper was the only all-winning Scottish skip, taking three matches. On the first day of play, the Westchester Wicks, a women's organization skipped by Mrs. Frank S. Baker, defeated the Scots, 6-5.

Another bright spot of the campaign was the international centennial bonspiel of the New York Caledonians played at St. Andrew's. The Thistle club of Montreal, led by Dick Walsh, routed two rivals on the final day to gain first prize. In a scheduled 14-end final the Thistles defeated Mahopac (N.Y.), skipped by Jock MacFarlane, 19-5. The Thistles had won their semifinal from Caledonia No. 1, skipped by Frank S. Baker. The Utica (N.Y.) No. 1 rink, skipped by Fred Parkinson, set back Utica No. 2 by 18-8 to capture the Gordon Grand National medal at Schenectady, N.Y. The No. 1 rink from the Country club of Brookline, Mass., with W. Donald Swan, skip, won the Douglas medal in a three-day bonspiel at St. Andrew's. The winners beat Schenectady No. 2 by 12-11 in the final. The Griffith medal for the consolation flight went to Schenectady's No. 1 group. In the midwest, where the sport continued to grow, the annual championship of the Midwest association at La Crosse, Wis., climaxed the season. Frank Kleffman's team from Hibbing, Minn. (region 6), took the laurels by halting the Rogers rink, defending titleholder, 12-3, in the final day's match. The U.S. women's association championship was taken by the Wauwatosa (Wis.) Granites. Mrs. Erwin Nell, skip, Mrs. Ben Dunlop, Mrs. Tillman Bruett and Mrs. Fred Rathkamp comprised the winning team. The Heather club of Chicago won both the Indian Hill and Exmoor trophies in women's play and the Utica club Glen Garries gained the Skokie trophy.

Other winning teams, with skips in parentheses, included the following:

- Northwest championship—Superior, Wis. (Ray Somerville)
- Midwest association bonspiel—Duluth, Minn. (Ed Nicoliason)
- Detroit international, grand aggregate—Wauwatosa, Wis. (Luke Collins)
- Manitoba, grand aggregate—Manitou (Bill Sharpe)
- British Consols trophy—Strathcona C.C., Winnipeg (Bill Sharpe)
- Quebec international championship—Club Jacques-Cartier, Quebec (G. Amyot)
- Quebec grand aggregate—Bathurst, N.B. (Charles McArdle)
- Chateau international—Etchemin club, St. Romuald, P.Q. (N. Lemelin)
- Omega international—Bathurst (Charles McArdle)
- François Jobin Gold cup—Bathurst (R. A. Archibald) (T. V. H.)

Cycling. Jack Disney of Altadena, Calif., won national senior open laurels for the second successive year in the 1955 championships of the Amateur Bicycle League of America. Taking first in the half-mile, mile and 5-mile contests, Disney scored 21 points in the competition held at Flushing Meadow track, Flushing, L.I., Aug. 27-28. Arthur Longs, Fitchburg, Mass., was runner-up with 12 points. Pat DeCollibus, Buffalo, N.Y., became the new junior titleholder after winning two races and placing second in another for 19 points. Jean Robinson of Detroit, Mich., regained the women's national title with 21 points, sweeping the half-mile, mile and 2-mile races. Nancy Nieman, Detroit's defending champion, was second with 15 points.

Ernie Matteis of Somerville, N.J., won United States 50-mile road racing honours on Sept. 11. He was timed in 2 hr. 15 min. 23 sec. over a hilly Fairmount Park course in Philadelphia. Ed John Chiselko, also of Somerville, was second. Arthur Longs was among the year's racing stars, numbering among his victories first prizes in the Eastern 75-mile championship and the first two races of a series to determine a national amateur around champion. Ruppert Walzl of Brooklyn, N.Y., set a new U.S. mark of 1 hr. 2 min. 1.4 sec. in winning the Middle Atlantic 25-mile title.

World Championships.—Stan Ockers, Belgium, won professional road racing laurels at Frascati, Italy. Ockers covered the course of 293.132 km. in 8 hr. 43 min. 29.2 sec. The 90° heat forced many riders, including Louison Bobet, defending champion from France, and Fausto Coppi, Italian ace, to withdraw. Italy's Sante Ranucci led home Lino Grassi, Italy, in a close duel for world amateur honours. Gino Bruni, Italy, placed third.

Tour de France.—Louison Bobet captured cycling's most difficult race for the third successive year, a feat unparalleled in the 42-year-old history of the classic. Bobet finished the 22-day grind of about 2,704 mi. only 4 min. 53 sec. in front of Jean Brankart, Belgium, his nearest rival. A field of 130 started the tour that wound through four countries, but only 69 finished. Earlier in the year, Bobet had lost his French national road cycling title to Andre Darrigade. (T. V. H.)

C.Y.O.: see SOCIETIES AND ASSOCIATIONS, U.S.: Catholic Organizations for Youth.

Cyprus. Cyprus is a British island colony and strategic base in the eastern Mediterranean. Area: 3,572 sq. mi. Pop.: (1946 census) 450,114 (80.3% Orthodox Greeks; 17.9% Moslem Turks); (1954 est.) 517,000; 10% of the population can speak English. Chief towns (pop., 1953): Nicosia (cap., 40,200; Limassol 27,000; Famagusta 20,500; Larnaca 16,300. Governors in 1955: Sir Robert Armitage and (from Oct. 1955) Field Marshal Sir John Harding.

History.—A more sinister phase of Cyprus affairs opened after Greece's failure in Dec. 1954 to win a place on the United Nations agenda for discussions on the island's future. The terrorist organization EOKA became bolder and was identified with murder, bomb attacks and thefts of arms and ammunition. Archbishop Makarios, leader of the *enosis* movement (which demanded self-determination as much as union with Greece) intensified his campaign against the government, and the colonial office spoke of evidence that he was enlisting Communist support. A. T. Lennox-Boyd, United Kingdom secretary of state for the colonies, visited the island in July 1955, when he met the archbishop; and in September Greek and Turkish delegates w

to London for a conference. This was suspended on Sept. 7 with neither side accepting British proposals for a large measure of self-government. The Turks remained highly sensitive to any thought of change in Cyprus' status and severe anti-Greek riots in Turkey in September damaged feelings between the two countries and endangered NATO relations.

In the meantime Greece again sought the inclusion on the UN agenda of self-determination in Cyprus, but was outvoted. A serious riot occurred in Nicosia, when the British institute was burned and ransacked. On Sept. 25 the British government announced that in view of Cyprus' importance as a NATO base and the need for concerted action by all security forces to keep law and order, Field Marshal Sir John Harding would take over the governorship from Sir Robert Armitage. Harding arrived in Cyprus at the beginning of October (considerable troop reinforcements already having begun) and at once held talks with Archbishop Makarios. No agreement was reached, but there were signs that the Greek Cypriot Church's political front was divided on the question of self-government before self-determination. (See GREECE.) (J. J. Ty.)

Education.—Schools (1953-54): elementary 730, pupils (1953) 67,994; secondary 57, pupils 18,353; agricultural 2; trade 1; teachers' training colleges 2, pupils (1953) 217.

Finance and Trade.—Monetary unit: piastra (180 piasstras = £1 sterling = \$2.80 U.S.). Budget (ordinary, 1955 est.): revenue £9,658,165, expenditure £9,562,023; development (1954 est.), revenue £162,740, expenditure £1,373,658. Foreign trade (1954): imports £23,600,000; exports £17,000,000. Main products and exports: pyrites (955,000 metric tons, 1954), asbestos, copper, citrus, carobs, wine, vines, olives, potatoes.

Czechoslovakia. A people's republic of central Europe, Czechoslovakia is bounded west and northwest by Germany, north and northeast by Poland, east by the U.S.S.R., south by Hungary and Austria. Area: 49,354 sq.mi. (including autonomous Slovakia, 18,902 sq.mi.). Pop. (1954 est.): 12,948,000 (including Slovakia 3,750,000). Language (1954 est.): Czech 65.4%; Slovak 27.7%; German 1.4%; Hungarian 3.1%; Ukrainian 1.4%; Polish 0.7%. Religion (1930

census): Roman Catholic (Latin rite) 73.5%; Protestant (all denominations) 7.7%; Czechoslovak Church 5.4%; Greek Catholic 4%; Greek Orthodox 1%; Jewish 2.4%; atheist 5.8%. Chief towns (pop., 1947 census): Prague (cap.) 922,284; Brno 273,127; Moravska Ostrava 180,960; Bratislava 165,134; Plzen (Pilsen) 117,814; Olomouc 58,617; Usti nad Labem 56,328; Liberec 52,798; Kosice 51,689. First secretary of the Communist party of Czechoslovakia in 1955, Antonin Novotny; president of the republic, Antonin Zapotocky; chairman of the council of ministers, Vilem Siroky.

History.—As a result of the elections to the national assembly which took place on Nov. 28, 1954, the Communist leaders of Czechoslovakia were able to claim that about 98% of the population was in favour of the regime and that "the enemies of our regime were not able to do better than 2%." The electorate were in fact offered no choice of candidates and were placed under considerable pressure to participate in what was mainly a nation-wide political demonstration. The new government appointed after the elections, with Siroky as prime minister, differed only in detail from its predecessor. No important changes in the leadership of government or party took place during 1955.

At the first meeting of the new national assembly Siroky outlined his government's policy for 1955 and laid great stress on the need for greater agricultural output, which had remained at about the pre-World War II level. This was the government's most serious preoccupation throughout the year. While asserting his faith in the collective farms, which already embraced 44% of the country's arable land, as the basis for improved production, the prime minister promised "full support" for individual farmers and condemned the use of pressure to force them into the collectives. In the spring prices offered by the government for deliveries of farm produce were raised and financial incentives were offered to persons willing to enter farming.

In the middle of the year, however, the authorities reverted to a firmer farm policy. At a special meeting of the party central committee in June, Novotny, the first secretary, called

GYMNASTS performing in the first national Spartakiade held at Prague, Czech., in June and July 1955

for "a systematic persuasion drive to convince small holders and medium farmers of the necessity for joining collective farms and setting up new ones." They must not wait, he said, for "spontaneous progress." This appeal was followed in August by a campaign to "suppress" the kulaks, or wealthier farmers. Bad weather and lack of manpower were reported to be threatening the harvest later in the year.

By contrast with the situation in agriculture the authorities appeared satisfied with the progress made in industry, the output of which was said to have doubled since 1949. The 1955 plan conformed to the principle of priority for heavy industry and provided for an increase in military expenditure from 8.9% to 12.1% of the total budget. The revised plan for 1954 was said to have been fulfilled in most respects. Reductions in the prices of consumer goods, except for food, were announced in March. New trade union rules introduced in May were intended to instill a greater sense of discipline "into the soul of every worker and employee."

At the end of October, however, the authorities were forced to admit a serious crisis in the coal-mining industry resulting from the shortage of manpower and failure to recruit new labour. "Extraordinary measures" were decreed for recruiting labour to avoid a major fuel crisis.

An amnesty was proclaimed in May for certain categories of relatively minor offenders. It did not affect political prisoners serving long sentences, but it was extended to cover persons who had fled the country illegally. This was made the basis of an intensive campaign to persuade émigrés to return.

In common with the other Communist countries of eastern Europe, Czechoslovakia became a member of the collective defense treaty organization set up in Warsaw in May. In all pronouncements on foreign affairs the Czech and Slovak leaders echoed the policy of the Soviet government. In September they announced a reduction of 34,000 in the size of the armed forces, following similar moves by other Communist states. (See also EASTERN EUROPEAN ECONOMIC PLANNING.) (D. Fd.)

Education.—Schools (1953): nursery, pupils 165,000; primary 9,045, pupils 1,030,000; higher primary 2,745, pupils 473,000; secondary 304, pupils 80,300; vocational, pupils 113,000; institutions of higher education 17, students 42,000. There were also Hungarian, German, Ukrainian and Polish schools.

Agriculture.—No reliable data published since 1951. Main crops (metric tons, 1948-50): wheat 1,485,000; barley 1,034,000; oats 972,000; rye 1,233,000; maize 239,000; potatoes 6,780,000; sugar beet 4,455,000. Livestock: cattle (1951) 4,100,000; pigs (1951) 3,700,000; sheep (1950) 480,000; horses (1950) 640,000.

Industry.—Employment in manufacturing (Nov. 1949): 1,477,700. Production (metric tons, 1954 est.): coal 20,200,000; coke 5,400,000; lignite 35,000,000; crude oil 180,000; pig iron 2,900,000; steel 4,500,000; electricity 13,500,000,000 kw.hr.; cement (1949) 1,738,000.

Finance.—Budget (1954 est.): revenue 87,800,000,000 koruny; expenditure 87,600,000,000 koruny, including 49,000,000,000 koruny invested in the national economy. Monetary unit: koruna, revalued on May 30, 1953, with an official exchange rate, high and fictitious, of 7.20 koruny to the U.S. dollar as compared with the previous exchange rate of 50 koruny to the dollar.

Foreign Trade.—(1950) Imports U.S. \$653,000,000; exports U.S. \$800,000,000. Main sources of imports (1950): U.S.S.R. 29.4%; Poland, Rumania, Hungary and Bulgaria 26.0%. Main destinations of exports: U.S.S.R. 28.0%; four other eastern European countries 21.1%. Trade with the Soviet bloc considerably increased between 1950 and 1953, namely: with the U.S.S.R. by 63%, with Poland by 44%, with Rumania by 137%, with Hungary by 100%, with Bulgaria by 65%. Czechoslovak trade with 17 western European countries (1953): exports U.S. \$144,300,000; imports U.S. \$83,500,000.

Transport and Communications.—Roads (1946): 43,969 mi. Licensed motor vehicles (Dec. 1950): cars 165,000, commercial 65,000. Railways (1947): 8,161 mi. Air transport (1953 est.): 1,689,000 km. flown; 20,541,000 passenger-kilometres. Telephones (1954 est.): 350,700. Radio receiving sets (Dec. 1952): 2,717,000, including 320,000 in Slovakia.

Dahomey: see FRENCH UNION; FRENCH WEST AFRICA.

Dairy Products. U.S. milk cows in June 1955 numbered 22,067,000 as compared with 22,425,000 a year earlier. Nevertheless, milk production continued at a

record level, the total for the year being indicated as slightly greater than the 123,700,000,000 lb. of 1954, with some further expansion likely in 1956.

Government price supports were continued at 56.2 cents per pound for butter fat and \$3.15 per hundredweight for manufacturing milk, but the amounts offered to the government were reduced by about 30% as compared with 1954. A major fraction of the Commodity Credit corporation stockpile of dairy products was disposed of, largely overseas, and disposals exceeded acquisitions during the year.

Prices received by farmers for all wholesale milk averaged \$4.16 per hundredweight in September as compared with \$4.11 per hundredweight a year earlier and an average of \$4.42 per hundredweight for the 1947-49 period. Prices paid to farmers who retailed milk averaged 20.9 cents per quart in September, slightly higher than the 20.6 cents prevailing a year before and well above the 18.3-cent average of 1947-49. Butterfat in cream at 56.6 cents per pound was slightly above the 55.8 cents of Sept. 1954 but much below the average 71.2 cents per pound of 1947-49.

Butter production in 1955 declined below the 1954 rate of 1,449,000,000 lb. Consumption increased 3% over 1954 to 9.1 lb. per capita as compared with a low of 8.5 lb. per capita in 1953. The use of margarine meanwhile declined slightly to 8.1 lb. per capita as compared with a peak level in 1954 of 8.4 lb. per capita. Government purchases of butter declined throughout the year; stocks in the hands of the C.C.C. as of June 30 were 273,895,000 lb. valued at \$169,347,000 as compared with 467,057,000 lb. valued at \$304,309,000 a year previously. Moderate amounts of butter oil were distributed in India and Pakistan and "American ghee."

Cheese production was slightly lower in 1955 than the 1,363,000,000 lb. of 1954. In particular, less American cheese was produced; some minor types showed an increase. Consumption per person was indicated as 7.9 lb., or 4% more than in 1954. Privately held stocks increased and the government-held stockpile dropped to 349,615,000 lb. valued at \$139,874,000 as of June 30, as compared with 419,082,000 lb. valued at \$167,598,000 as of June 30, 1954. The comptroller general of the U.S. in 1955 questioned the \$2,000,000 involved in the purchase-resale transaction of March-April 1954 under which the Commodity Credit corporation, as dairy price supports were being lowered from 90% to 75% of parity, paid 37 cents per pound for cheese in dealers' warehouses, then sold it back to them at 34½ cents per pound without taking actual possession.

Ice cream production and consumption were moderate, larger in 1955 than the 71,350,000 gal. of 1954, in spite of further rapid expansion in competitive marketing of "Mellorin type" frozen desserts (utilizing vegetable oils instead of butterfat), of which 28,260,000 gal. were produced in 1954 in the states permitting such production.

World milk production in 1955 increased to a level more than

Milk Production in Principal Producing Countries

Country	(In millions of pounds)			
	Preliminary 1954	1953	1952	Average 1934-53
United States	123,702	121,449	115,197	105,411
France	40,860	38,590	34,079	33,000
Western Germany	37,597	36,905	34,862	33,060
United Kingdom	24,195	23,572	22,454	18,420

*Average, 1935-38.

†Average, 1935-39.

one-fifth above prewar, but only enough to meet 60% of the estimated minimum dietary needs of the world's population. Factory production of cheese and canned milk increased in 1955

WEBSTER DAM, Kansas. An aerial construction photograph made May 31, 1955. The dam was being built by the U.S. bureau of reclamation as part of the Missouri river basin project

but butter and dried milk declined. Factory butter produced in the principal countries in 1954 was 5,624,000,000 lb., and world production, including farm butter, was estimated at 9,545,000,000 lb. Cheese production, including farm cheese for the more important dairying countries, was estimated at 5,308,000,000 lb. in 1954 as compared with 5,214,000,000 lb. in 1953 and 3,530,000,000 lb. before World War II.

Milk production in Canada increased by about 2%; more than half of it was used for manufactured factory products. The government continued to buy butter at 58 cents per pound and exported some storage stocks at a lower price. England experienced an unusual summer shortage of fluid milk, and all manufacture of dairy products was temporarily discontinued.

Australia, with a new record milk production of 13,200,000,000 lb. for 1954-55, achieved record butter production of 423,000,000 lb. and increased export availability by about 50%. Cheese production was reduced by 10% to less than 100,000,000 lb.

(J. K. R.)

Dakar: see FRENCH WEST AFRICA.

Dams. World-wide interest in the construction of dams for the optimum development of water resources continued during 1955. Table I lists 15 of the important dams of the

world under construction or completed during 1955. The fifth International Congress on Large Dams, an assembly of 800 delegates, met in Paris May 31 to June 4 to review developments and progress in the science and art of dam design and construction.

Increased appropriations for dams resulted in 1955 in the United States as the policy of the federal government favoured multipurpose projects in partnership with local agencies. At the Dalles dam on the Columbia river, concrete was placed at 6,000 cu.yd. per day, with pours limited to night hours from June to September in order to keep temperatures and consequent shrinkage to a minimum. Upstream, many proposed dams were held in abeyance pending clarification of varying interests.

The world's largest rolled earth-fill dam, Oahe, on the Missouri river, required presoaking of the earth borrow areas with 55 in. of water supplementing the 16 in. of rain in order to obtain the proper proportion of moisture for compaction. At the same time, 28 8-in. drain holes, 100 ft. apart, 600 to 1,000 ft. long, were drilled into the bluff at the spillway stilling basin excavation to aid in the prevention of slides from excessive ground-water pressures. Uneven rebound of the 200-ft.-deep excavation required changes in plans. A unique 85-ton tunnelling machine bored through the shale of the Pierre formation at the rate of four feet per day to form the six tunnels for the outlet works. Upstream, Gavins Point, reregulating dam for Fort Randall, was closed July 31 with the aid of the huge 13-cu.yd.

Table I.—Chief Dams Completed or Under Construction During 1955

electric drag line, after being delayed one month for completion of work at the intake.

The Long Sault dam, major element of the St. Lawrence International Hydro-electric Development, key to the St. Lawrence Seaway, began to take shape early in 1955 with the unwatering of its cofferdams. Cofferdams were also unwatered for the Barnhart Island powerhouse on June 23 after pumping out 65,000,000 gal. in eight days. The latter forms the dam across the north channel of the St. Lawrence river and, together with the Long Sault dam, floods the International rapids, creating the head for the great power development and the navigation pool for the seaway.

Work was also commenced on Iroquois dam, 30 mi. upstream, which would regulate the levels of Lake Ontario in place of the natural rock control which must be removed to facilitate navigation.

Power developments in France continued to feature arch dams in 1955 with the completion of 215-ft.-high, 575-ft.-long Couesque dam on the Truyère river and the construction of 250-ft.-high Cagnet dam on the Drac river. Another concrete arch, Drossen dam, on the Kaprun river in Austria, was also under construction in 1955. This dam, together with Mooser dam, would form Mooserboden reservoir, middle reservoir of the tremendous Glockner-Kaprun pumped-storage scheme. Another pumped-storage project, the Oberaar-Grimsel scheme, located in the glaciers of the Bernese Oberland in Switzerland, was completed in 1955 with the completion of Oberaar dam.

Sariyar dam, the 360-ft.-high concrete gravity dam on the Sakarya river in Turkey, reached the halfway mark in 1955, with concrete being placed at 57,000 cu.yd. per month. Development of the power at Zongo falls of the Inkisi river in the Belgian Congo was underway in 1955 as the diversion dam, Zongo I, neared completion.

Completion in 1955 of the Ghulam Mohamed barrage on the

Indus river in Lower Sind province of Pakistan culminated four years of work in intense heat and dust, as well as floods and diversion difficulties. The dam is 3,000 ft. long, made up principally of 44 gates 60 ft. long and 21 ft. high, with a ship lock. The dam supplies four feeder canals to irrigate nearly 3,000,000 ac., about two-thirds of which would be newly cultivated land.

Progress on the Snowy mountain project in Australia was marked by the completion ahead of schedule early in 1955 of the first element of the project, Guthega dam, at the junction of the Guthega river with the Snowy river. (See also IRRIGATION.) (B. O. M.)

Dance. Ballet.—While the New York City Ballet danced extensively in Europe during 1955, and Ballet Theatre toured South America, the Sadler's Wells Ballet, Festival Ballet of London, ten dancers from the Royal Danish Ballet and several companies of Spanish dancers appeared in America. A Japanese company danced in Europe; Martha Graham planned a tour of the orient.

United States.—The state department officially recognized the dance as an important part of its cultural exchange program. Under a plan administered by the American National Theatre and Academy, with the assistance of a dance advisory committee, the state department sponsored South American tours of Ballet Theatre and José Limon, and some of the European performances of the New York City Ballet. Graham's oriental tour, beginning in Nov. 1955, was under its auspices.

The New York City Ballet danced *The Nutcracker* for several weeks, breaking records for successive nightly performances of one ballet. Later the company produced *Roma*, choreographed by George Balanchine, music by Georges Bizet, and *Pas de Trois*, by Balanchine, music by Michael Glinka. *Ivesiana* was revised. In summer 1955 the company danced in Monte Carlo, Marseilles, Lyons, Florence, Rome, Bordeaux, Lisbon, Paris, Lausanne, Stuttgart, Amsterdam and The Hague. On its return to America it appeared in Los Angeles, San Francisco and Chicago.

Lincoln Kirstein resigned as managing director of the New York City centre but remained as director of the New York City Ballet. Janet Reed left the company; Melissa Hayden and Yvonne Mounsey rejoined it. Maria Tallchief returned during the European tour. Other leading dancers included Tanaquil Le Clerq, Diana Adams, Patricia Wilde, Jillana, André Eglevis, Nicholas Magallanes, Francisco Moncion, Herbert Bliss, T. Bolender, Roy Tobias and Jacques d'Amboise.

Ballet Theatre completed a transcontinental tour before its 15th anniversary season at the Metropolitan Opera house, New York city. Ballets added to the repertoire were *A Street Named Desire* and *The Sphinx*, both created by other companies. Antony Tudor revived his *Pillar of Fire*, *Lilac Garden*, *Romeo and Juliet*, the *Judgment of Paris* and *Gala Performance*. *Le Quatre*, *Bluebeard*, *Petrouchka* and *Three Virgins and the Devil* were restored to the repertoire. Leonide Massine restored his *Aleko* and *Mam'zelle Angot*.

Nora Kaye rejoined Ballet Theatre after a three-year absence. Alicia Alonso and Igor Youskevitch resigned to join the Ballet Russe de Monte Carlo. Rosella Hightower and Sonia Ar

CONSTRUCTION PHOTOGRAPH of the spillway of the dam for the Gorky hydroelectric station on the Volga river, U.S.S.R.

joined the company. Erik Bruhn, on leave of absence from the Royal Danish Ballet, toured with the company and partnered Alicia Markova in *Giselle* during the New York season. John Kriza, Ruth Ann Koesun, Lupe Serrano and Eric Braun were principal dancers; guests included Annabelle Lyon, Viola Essen, Tatiana Riabouchinska and Anton Dolin. Lucia Chase resumed roles she had created. Hugh Laing returned to the company. During Ballet Theatre's tour of South America, its Buenos Aires performances were briefly interrupted by the revolution which deposed President Juan Perón.

The Ballet Russe de Monte Carlo toured the United States, with Frederic Franklin as *maitre de ballet* and *premier danseur*. Igor Youskevitch was appointed artistic adviser as well as leading dancer. Maria Tallchief left the company in April, and Alonso signed a contract to join it later. Other artists included Nina Novak, Leon Danielian, Gertrude Tyven, Irina Borovska, Yvonne Chouteau and Victor Moreno. Mia Slavenska appeared as guest artist.

Sadler's Wells Ballet, directed by Ninette de Valois, began its fourth American tour with an autumn season at the Metropolitan Opera house, New York city, presenting the first American performances of its productions of *The Firebird*, *Coppélia*, *Tiresias*, *Les Sylphides*, *Scènes de Ballet*, *Rinaldo and Armida*, *The Lady and the Fool* and *Madame Chrysanthème*. Featured dancers were Margot Fonteyn, Beryl Grey, Svetlana Beriosova, Violetta Elvin, Rowena Jackson, Frederick Ashton, Michael Somes, Alexander Grant, John Hart, Alexis Rassine, Brian Shaw, David Blair and Philip Chatfield.

For the Metropolitan Opera Ballet, Zachary Solov choreographed *Vittorio*, music by Giuseppe Verdi. Principal dancers were Slavenska, Yurek Lazowski, Jean Lee Schoch, Judith Younger, Edward Caton and Solov, making his first Metropolitan Opera appearance as a dancer. Markova appeared in *Orfeo*.

The Bethsabée de Rothschild foundation sponsored a season of modern American dance at the ANTA theatre, New York city. Works by Martha Graham included *Ardent Song*, a revised version of *Theatre for a Voyage* and new choreography for Norman Dello Joio's score *St. Joan*, retitled *Seraphic Dialogue*. The José Limon company appeared in *The Traitor*, *Felipe el Loco* and other works. Anna Sokolow produced *Rooms* and Valerie Bettis revived *As I Lay Dying*. John Butler and Pearl Lang appeared with their companies. Other soloists included Janet Collins, Ann Halprin, Pauline Koner, Iris Mabry, Paul Draper and Daniel Nagrin.

An unprecedented number of Spanish dance companies appeared in New York city, including those of Antonio, Teresa and Luisillo, and Vincent Escudero.

Ted Shawn, director of the Jacob's Pillow Dance festival, brought ten members of the Royal Danish Ballet to America. Mona Vangsaa, Inge Sand, Kirsten Ralov, Mette Mollerup, Kirsten Petersen, Viveka Segerskog, Frank Schaufuss, Fred Bjoernsson, Stanley Williams and Flemming Flindt appeared in works by the 19th-century Danish choreographer Auguste Bournonville. Birgit Akeson made her American debut at the festival, at which Alonso, Bruhn, Slavenska, Merce Cunningham, Alexandra Danilova, Josefina Garcia, Carola Goya, Iva Kitchell, Matteo, Priyagopal, Ruth St. Denis and Xenia Zarina also appeared. Shawn danced the role of Lear in *Sundered Majesty*, choreographed by Myra Kinch.

At the American Dance festival, New London, Conn., Doris Humphrey choreographed *Airs and Graces*, with music by Pietro Locatelli, and revived *The Shakers*. Other new works included *Cherzo* and *Symphony for Strings*, choreographed by José Limon, *Idyl* and *The Antagonists*, by Ruth Currier, *Concertino* and *A Major*, by Pauline Koner, and *Satyros* and *Ballad*, choreographed jointly by Lavina Nielsen and Lucas Hoving.

The Brooklyn Academy of Music presented several major companies not seen elsewhere in New York city. Festival Ballet of London, directed by Dolin, appeared there after touring the United States and Canada. A short version of Bournonville's *Napoli* featured Toni Lander and Oleg Briansky; other artists were Nora Kovach, Nathalie Krassovska, Belinda Wright, Violette Verdy, Tamara Toumanova, Istvan Rabovsky and John Gilpin.

In Brooklyn the National Ballet of Canada, headed by Celia Franca, Lois Smith and David Adams, presented Tudor's *Offenbach in the Underworld*.

John Butler, choreographer of the New York City Opera for its spring season, resigned and was replaced by Ray Harrison. The Juillard Dance theatre was organized, and presented works by Humphrey and Sokolow.

Shanta Rao and Marcel Marceau made American debuts. Paul Draper, Angna Enters, May O'Donnell, Pearl Primus, Marina Svetlova, Sahomi Tachibana, the Dance Drama company and the ballet groups of William Dollar and Robert Joffrey made New York concert appearances. Danilova, Kitchell, Svetlova, José Greco, Ruthanna Boris, Frank Hobi, Mata and Hari and Miriam Marmein toured extensively.

The San Francisco Ballet presented Balanchine's *Apollo* and Lew Christensen's *Renard*. *The Nutcracker* was revised. Carmalita Maracci danced in Los Angeles, where Michel Panaieff presented his company in *Song Without Words*.

Ruth Page was choreographer of the Chicago Lyric theatre, with Patricia Wilde as guest ballerina. Ballet Guild of Chicago produced Page's ballets *The Triumph of Chastity* and *Spectre of Love*, and works by Romola James, Richard Ellis and Christine du Boulay. For the Stone-Camryn Ballet, Walter Camryn choreographed *Waltz Suite* and Bentley Stone a *Schubert Impromptu*.

The Southern Ballet, headed by Karen Conrad and Pittman Corry, produced *The Nutcracker* in Atlanta. The Dance council of Dallas was organized and presented original works by Texas choreographers.

Louis Horst received the Capezio award for service to the dance. Capezio, Inc., made a special grant to the dance department of the High School of Performing Arts, New York city. The Dance Business Group of America announced grants to Lang, Limon, the Dance Drama company, the Ballet guilds of Chicago and San Francisco and the Merry-Go-Rounders.

The Rockefeller foundation awarded grants to Ann Hutchinson of the Dance Notation bureau and to the Connecticut School of the Dance. The Henry Hadley medal for distinguished service to American music was given to Martha Graham.

England.—Sadler's Wells Ballet toured Italy and Great Britain late in 1954. Beryl Grey returned after a leave of absence. Beriosova was named ballerina. Ashton choreographed *Variations on a Theme of Purcell*, music by Benjamin Britten, *Madame Chrysanthème*, music by Alan Rawsthorne, and *Rinaldo and Armida*, music by Malcolm Arnold. *Ballabile* and *Les Sylphides* were revived, and John Cranko's *The Lady and the Fool* was added to the repertoire. Dolin made his final appearance as Satan in *Job*. De Valois was awarded the honorary degree of doctor of letters by Oxford university, and that of doctor of music by the University of Sheffield.

Sadler's Wells Theatre Ballet produced *Dances Concertantes* and *House of Birds*, both choreographed by Kenneth Macmillan. *Les Patineurs* was added to the repertoire, and *Café des Sports* received its first London performance. *Selina* was revived. The company began an extended tour of Great Britain. Maryon Lane, Annette Page and David Poole resigned to join the Sadler's Wells Ballet.

Festival Ballet returned from an American tour. Harald Lan-

der's *Etudes* was added to its repertoire. *Mademoiselle Fifi* was produced, with Danilova and Michael Maule as guest artists. Kenneth Melville joined the company.

Ballet Rambert toured Great Britain, and danced at the Aix-les-Bains festival. During a summer season in London, Macmillan's *Laidrette* and Joffrey's *Persephone* and *Pas des Déesses* were presented. Beryl Goldwyn retired; the company was headed by Noreen Sopwith, Ann Horn, Alexander Bennett and Norman Dixon.

In the autumn of 1954 the Paris Opera Ballet danced at Covent Garden. Soviet dancers Raissa Struchkova and Alexander Lapauri appeared in London. The Yugoslav National Opera and Ballet, Bulgarian State company, Azuma Kabuki dancers and Antonio and his Spanish Ballet were among foreign companies visiting London. Markova danced in a Christmas production of *Where the Rainbow Ends*, staged by Dolin, with choreography by John Taras. Ballet Workshop produced new ballets by Peter Darrell, Donato Fortes and Michael Holmes.

Fonteyn was re-elected president of the Royal Academy of Dancing, which established a scholarship honouring Dame Adeline Genée.

At the Edinburgh festival, the Royal Danish Ballet appeared in *La Sylphide*, *Capricious Lucinda* and *Romeo and Juliet*.

France.—Serge Lifar, director of the Paris Opera Ballet, choreographed *Les Noces Fantastiques*, music by Marcel Delannoy. John Cranko became the first English choreographer ever engaged by the Paris Opera, when his ballet *La Belle Hélène* was presented. *The Tragedy of Salome* was revived, choreography by Albert Aveline. Francine Collement, Josette Amiel and Micheline Grimoin were named *premières danseuses*, and Peter van Dijk was engaged as *danseur étoile*. Liane Daydé took a leave of absence.

The Grand Ballet du Marquis de Cuevas produced *Achille*, *The Return* and *La Reine Insolente*, choreographed by George Skibine, *Scarlattiana*, choreographed by Wladimir Skouratoff, *Le Lien*, choreographed by Paul Goubé, and *Joan of Arc*, choreographed by Leone Mail. In the court square of the Louvre, Paris, it produced Hector Berlioz' *Romeo and Juliet*, with choreography by Skibine, Skouratoff and Taras. Belinda Wright joined the company, which was headed by Marjorie Tallchief, Genia Melikova, Jacqueline Moreau, Skibine, Skouratoff and Serge Golovine.

The Paris Opéra Comique produced *The Nutcracker*, with choreography by Constantin Tcherkas.

The Amsterdam Opera Ballet danced in Paris and Monte Carlo. Yvette Chauviré was guest artist. Olga Preobrajenska, former ballerina of the Russian Imperial Ballet, was granted the diploma of an *officier du mérite civique de France* in recognition of her valuable service as a teacher. Francine Collement received the Prix René Blum.

For the Evian festival, Chauviré choreographed *La Péri*, and danced it with Serge Perrault. The Vichy theatre revived the ballet-opera *L'Atlantide*, with Ethery Pagava as guest artist.

Josette Clavier and Pierre Lacotte left the Opera to organize Les Ballets de la Tour Eiffel, which appeared in Paris, as did Ballets de l'Étoile and Ballets Modernes de Paris.

Australia.—The Borovansky Ballet toured Australia and New Zealand with a repertoire of 15 ballets. Yurek Shabelevsky and Royes Fernandez joined Kathleen Gorham, Jocelyn Vollmar, Vassili Trunoff and Paul Grinweis as principal dancers. *Tres Diabolos* was produced, with choreography by Grinweis.

Walter Gore and Paula Hinton organized the Australian Theatre Ballet, sponsored by the Australian Ballet society. The repertoire included Gore's *Street Games*, *Hoops* and *Classical Suite*.

Ballet Guild, headed by Laurel Martyn, toured New South Wales. Harcourt Algeranov and Claudie Algeranova toured for

the Australian Children's theatre. In Sydney, the Bodenweiss Ballet produced *Errand Into the Maze*.

Austria.—Gordon Hamilton was appointed assistant to Eril Hanka, ballet mistress of the Vienna State Opera, which engaged Jann Borall and Richard Adama. Harald Kreutzberg Dance Theatre Berlin and the Zagreb National theatre danced appeared in Vienna.

Belgium.—At the Théâtre de la Monnaie, Brussels, *Les Bal de Paris*, *Danse* and *Pelleas et Melisande* were produced. The Royal Danish Ballet appeared in Brussels.

Canada.—Tudor produced *Offenbach in the Underworld* for the National Ballet of Canada, which toured the dominion and appeared in Brooklyn, N.Y.

After a season of inactivity, the Royal Winnipeg Ballet was reorganized under Gweneth Lloyd, with Nenah Lhotka as ball master. Festival Ballet toured Canada.

Denmark.—The Royal Danish Ballet produced *Back Stage*, choreography by Bjoernsson, *Capricious Lucinda*, choreography by Niels Bjoern Larsen, and *Romeo and Juliet*, choreography by Ashton, music by Sergei Prokofiev. Taras staged *Balanchine Night Shadow*. Hans Brenaa made his farewell appearance. During the sixth Danish Ballet festival, the company celebrated the 150th anniversary of the birth of Auguste Bournonville, with performances of his *Napoli* and *Konservatoriet*.

Irina Tikhomirova and Geladij Ledjakh of the Bolshoi theatre, Moscow, danced in Copenhagen.

Finland.—Mary Skeaping produced *The Sleeping Beauty* in Helsinki, with Doris Laine and Margareta von Bahr as ballerinas. Fonteyn and Sömes made guest appearances in *Swan Lake*.

Germany.—The Berlin City Opera (west zone) presented ballets by Tatiana Gsovsky, Heinz Rosen and Jens Keith. Gsovsky organized the Dance Theatre Berlin, headed by Natasha Troianova, Gisella Deege, Gert Reinholm, Harald Horn and Ra Smolik.

The State Opera (east zone) produced *Apollo and Daphne*, *The Master's Right* and *The Converted Philistine*, all choreographed by Daisy Spies.

At the Munich Opera, Alan Carter choreographed *Four Times Four*, *The Miraculous Mandarin* and *The House of Shadows*.

In Hanover, Yvonne Georgi choreographed *Apollon Musgès*, *Happiness*, *Dream and Death*, *Serenade for Strings*, *Symphonie Fantastique*, and *Les Biches*. At the Düsseldorf Opera Kurt Jooss choreographed *Persephone*, and Hans Zullig staged *Pulcinella*.

Greece.—For the Athens festival Tudor staged the ball scenes of Christoph Gluck's *Orfeo*.

Italy.—An international dance festival was held at Nerone near Genoa. Participants included Markova, Milorad Miskovitch, Kreutzberg, John Butler, Grand Ballet du Marquis de Cuevas, Azuma Kabuki dancers and the Yugoslav National Ballet.

At the Rome Opera, Boris Romanoff staged the dances *Carmina Burana*. Dancers included Attilia Radice and Ugo dell'Ara; Svetlova appeared as guest artist. Romanoff revived *The Sleeping Beauty* and *The Nutcracker* in Bologna, with Romanoff dancers.

Michel Fokine's version of *The Firebird* was staged at Scala, Milan, by Serge Grigoriev and Lubov Tchernicheva, with Olga Amati and Ugo dell'Ara in leading roles. Later Fonteyn and Sömes appeared in this production.

Japan.—The Komaki Ballet produced *Swan Lake*, with Mutsaers Sunaga and Naoto Seki in leading roles. The Hattori Shimada company presented *Miss Julie*, with Shigedo Sasada as principal dancer. The Paul Szilard Ballet, headed by Coleman Marchand, Maria Angelica, Miskovitch and Michael Llaure, toured Japan. Danilova, Maule, Moscelyne Larkin and Romanoff Jasinsky began a tour of Japan, after appearing in Manila. J

CHILD BALLERINAS performing classical bows before their instructor at the Fahl School of dancing, Madison, Wis., which in 1955 celebrated its 75th anniversary

rdman danced in Hawaii, Japan and India.

Mexico.—During a season of Mexican ballet at the Palacio de Bellas Artes, Mexico City, new works included *Children's Corner*, choreographed by Guillermina Penalosa, *The Dream Shop*, choreographed by Guillermo Keyes Arenas, *The Daughter of the Moon*, choreographed by Rosa Reyna, and *Chromatic Fantasy and Rhapsody*, choreographed by Helena Jordan.

Keyes Arenas was the first dancer to receive a fellowship from the Institut Français de l'Amérique Latine.

Los Ballets de Mexico, headed by Felipe Segura, appeared in Monterrey and Guadalajara.

Netherlands.—The Netherlands Ballet, directed by Sonia Gasell, produced ballets choreographed by Balanchine, Taras, Aart Merstegen, Jap Flier and Rudi van Dantzig. For the Ballet der Lage Landen, Jack Carter staged *Coppélia* and choreographed *Il Pagliaccio* and *Pavana Interrumpida*. Max Doyes received a grant from the Amsterdam Gemeenterad, to produce a work for this company.

Françoise Adret directed the Amsterdam Opera Ballet, staging *The Dream of Véronique*. Scapino Ballet produced *The Women of Stayoren*, choreography by Jean Rebel.

South America.—Ballet Alicia Alonso completed a tour of South America with a return engagement at the Colon theatre, Buenos Aires, Arg. Ballet Theatre, José Limon, Manolo Vargas and Antonio toured South America.

At the Colon, Leonide Massine revived his *Choreartium* and *Les Deux d'Enfants*, and choreographed *Usher*, based on a story by Edgar Allen Poe, music by Robert Garcia Morillo, with José Leglia in the title role.

The National Ballet, Rio de Janeiro, Braz., produced new ballets by Tatiana Leskova, Nina Verchinina and Denis Gray. Alvin and Field were guest artists. The Ballet do IV Centenario, of São Paulo, directed by Aurel Milloss, appeared in Rio. In Santiago, Chile, Ernst Uthoff choreographed *The Prodigal*

Son and Alotria. Dimitri Rostoff directed a season of ballet in Lima, Peru, with Tatiana Grantzeva, Natalie Clare, Oleg Tupine and George Zoritch as guest artists.

Spain.—Pilar Lopez reorganized her company and danced *El Amor Brujo* in Madrid. Rosario, with Roberto Iglesias and Aida Ramirez, appeared at the Granada festival. The companies of Janine Charrat and Antonio danced in Madrid, as did Festival Ballet of London.

Sweden.—At the Royal Opera, Stockholm, Skeaping staged *The Sleeping Beauty*, with Elsa Marianne von Rosen, Mariane Orlando, Ellen Rasch, Gerd Andersson, Bjoern Holmgren, Bengt Andersson, Julius Mengarelli and Teddy Rhodin. Fonteyn, Grey, Sones and Field appeared as guest artists. Birgit Akesson was the first modern dancer to appear in concert at the Royal Opera house. (LN. M.)

Ballroom and Folk Dancing.—There were three widespread, distinctive new developments in ballroom dancing during 1955: the cha-cha-cha, the merengue and the rock 'n roll.

The cha-cha-cha was a variation of mambo but it did not supersede that dance in popularity; rather, it augmented it. By 1955 the mambo had become an international Latin-dance favourite. Conservative dance experts in England and Scotland held heated debates to determine the correct beat for accent and some of the largest orders for mambo musical recordings came from Tokyo, Jap. Mambo music even spread beyond Latin influence and old fox trot favourites such as "Why Don't You Do Right" and "Temptation" were rerecorded in mambo phrasing.

The cha-cha-cha is done to moderate mambo tempo with swing-style arrangements such as those heard in these 1955 hit recordings: "Adele," "Jamaquino," "Sweet and Gentle" and "Having a Ball." Cha-cha-cha step patterns in partnership position are very simple but expert dancers add almost unbelievable and rather ludicrous variety by dancing solo style, opposite their partners—imitating penguins, kangaroos, etc.

The merengue dance comes from the West Indies but it took several hundred years before it reached modern ballroom form.

The music and dance evolved from a combination of the stylized forms favoured by the early Spanish colonists plus the strong rhythms inherent in the Africans who had been transported to the Caribbean regions during slavery days. Merengue music is similar to that of one-step and paso doble. It is easy to keep time to the emphatic, marchlike beat so that once the dance started to travel, it progressed rapidly. Even a novice can quickly follow the music and can readily copy the "lame duck" or limping side step that is the outstanding characteristic of the dance. These recordings became internationally available in 1955: "Ay Caramba," "La Empaliza" and "Consigueme Eso."

The third new dance for 1955 developed in the United States. It was a form of jitterbug called rock 'n roll. The dance originated with teen-agers and, since they prefer fast, lively music, it seemed doubtful that adults would ever adopt the jumps and energetic hops of rock 'n roll. The best-known recording in this tempo was "Dance With Me, Henry."

Despite these new 1955 developments, the standard ballroom dances were not overlooked. The fox trot still held international first place. The waltz, too, continued, but with its usual mild influence. Second to the fox trot were the Latin dances and, of these, the mambo and rumba were by far the international favourites. In comparison, the tango and samba had minor rating.

There was a marked revival of interest in square dancing in the western part of the United States and in college towns. In April 1955, 7,654 members from 38 states attended the fourth National Square Dance convention in Oklahoma City, Okla. In July the *New York Times* stated that there were more than 3,500 professional callers in the country and that an estimated 15,000,000 people in the U.S.A. were familiar with the intricate, standard dance patterns.

Deafness: see HEARING.

Deaths (of prominent persons in 1955): see OBITUARIES.

Death Statistics. Mortality in the United States continued during 1955 at a low level. For the first eight months the death rate was only 9.3 per 1,000 total population, the same as for the corresponding period of the year before. For all of 1954, the number of deaths registered was 1,481,000, the death rate being 9.2 per 1,000 total population, excluding the armed forces overseas.

The age variation in mortality within the United States during 1954, in terms of death rates per 1,000 total population of stated age was: under one year, 30.3; ages 1-14 years, 0.7; ages 15-24 years, 1.1; ages 25-34 years, 1.5; ages 35-44 years, 3.1; ages 45-54 years, 7.7; ages 55-64 years, 17.5; ages 65-74 years, 39.2; ages 75-84 years, 86.6 and ages 85 and over, 175.1. For each age group, the death rate for 1954 was below that for 1953. Likewise, each race and sex category shared in the improve-

ment, death rates per 1,000 being: 10.5 for white males; 10.5 for nonwhite males; 7.7 for white females and 8.7 for nonwhite females.

Deaths of the heart continued as the outstanding cause of death during 1954, accounting for 37.4% of all deaths. Second rank was held by the malignant neoplasms (cancer and allied conditions), with 16% of all deaths. The rank of the first ten leading causes of death is shown in Table I. There were over 2,140 deaths from maternal causes in the United States during 1954, with a rate of 5.3 per 10,000 live births. Only one decade earlier, in 1944, the rate was 22.8 per 10,000 live births.

According to mortality conditions prevailing in the United States during 1953, the expectation of life at birth was 68.8 years, a gain of 21½ years since 1900. For white females in 1953, the expectation of life at birth was 72.9 years, while that for white males came to 66.8 years. In the nonwhite population the corresponding figures were 64.4 for females and 59.7 for males.

Provisional data for Canada, relating to the first eight months of 1955, showed an increase of 4% in deaths over the same period of the year before. For the whole of 1954, the number of deaths was estimated as 124,520, with a death rate of 8.2 per 1,000 total population. During the first half year of 1955, England and Wales experienced 8.3% more deaths than in the similar period of the year before. For the whole of 1954, England and Wales recorded 501,900 deaths (provisional figure) and a death rate of 11.3 per 1,000 total population. The death rate in Australia (excluding aborigines) in 1954 was 9.1 per 1,000, the same as for 1953. In New Zealand, the population of European origin registered a death rate of 9.0 per 1,000 in 1954. Death rates for 1953 and 1954 for a number of countries are shown in Table III. (See also ACCIDENTS; CENSUS DATA, U.S.; INFANT MORTALITY; INFANT MORTALITY; SUICIDE STATISTICS.) (M. Sp.)

Table I.—Estimated Death Rates, Rank Order and Percentage of Total Deaths for the Ten Leading Causes of Death, United States, 1954

Debt, National. The national debt of the United States at the end of fiscal year 1955 amounted to \$274,374,000,000, about \$3,000,000,000 higher than a year

lier. (See Table I.) This was the fourth successive yearly increase. In its Aug. 25, 1955, report reviewing the 1956 budget, the bureau of the budget estimated that the national debt would be further increased to \$275,000,000,000 by June 30, 1956. The prospective rise was attributed to an anticipated budget deficit (estimated at \$1,700,000,000) in the fiscal year 1956.

The upturn in public debt after fiscal year 1951 followed a substantial reduction during the 1946-48 period and an irregular, moderate increase over the 1949-51 period. The public debt as of June 30, 1955, was about \$5,000,000,000 below the peak total of \$279,214,000,000 reached at the end of Feb. 1946.

In Aug. 1954, congress enacted legislation by which the statutory debt limit of \$275,000,000,000, which had been in effect since mid-1946, was raised to \$281,000,000,000 until June 30, 1955. This legislation was extended for another year in June 1955.

The increases in public debt during the fiscal years 1952-55 stemmed primarily from budget deficits. The debt increase that occurred in 1955 reflected, in the main, a budget deficit of about \$4,000,000,000 partly offset by a decrease of a little more than \$550,000,000 in the treasury cash balance.

As shown in Table II, the debt increase in fiscal 1955—as well as in the three previous years—was concentrated in the marketable interest-bearing category. Over the four-year period, outstanding marketable issues increased by about \$17,300,000,000, absorbing more than nine-tenths of the net rise in total public debt. Such issues accounted for 56½% of the debt total as of June 30, 1955.

This development in the fiscal years 1952-55 marked a reversal of trend. Through fiscal 1951, the post-World War II debt retirement program of the treasury had involved a large reduction in marketable interest-bearing securities. From the debt peak in Feb. 1946, when they formed 71% of the total public debt, marketable obligations were reduced nearly \$62,000,000,000 by the end of June 1951. During the last ten months of 1946, the funds used to retire aggregate maturities of more than \$23,000,000,000 were obtained chiefly from the general fund cash balance accumulated by the Victory Loan drive. In the period Jan. 1947-June 1951, funds for reducing the marketable public debt were derived mainly from the growth of nonmarketable issues.

Of the public debt total of \$274,374,000,000 as of June 30, 1955, interest-bearing debt amounted to \$271,741,000,000 and

matured debt and debt bearing no interest amounted to \$2,633,000,000. The interest-bearing debt consisted of \$228,491,000,000 in public issues and \$43,250,000,000 in special issues held by the various governmental funds and agencies.

The publicly held debt, in turn, was comprised of \$155,206,000,000 in marketable obligations and \$73,285,000,000 in non-marketable obligations.

Table III shows the maturity distribution of interest-bearing public marketable securities for the years 1951-55. Particularly noteworthy is that the volume of securities maturing within one year was reduced by almost \$25,000,000,000 over the fiscal years 1954 and 1955. The proportion that such securities formed of the marketable total rose steadily from 27% as of June 30, 1950—a postwar low—to 52% as of June 30, 1953. By the end of fiscal 1955, however, the proportion had declined to 33%.

In fiscal 1955 the banking system reduced its holdings of federal securities by \$1,700,000,000. (See Table IV.) Nonbank investors thus absorbed more than the growth in the public debt.

The principal factor in the decline of bank holdings was the sale of government obligations by the federal reserve system, which shifted to a policy of relative tightness in the money markets in the latter part of fiscal 1955. Commercial bank holdings of federal securities, on the other hand, showed a decline of only \$200,000,000 during the fiscal year 1955. This small decline, however, masked a sharp swing in commercial bank holdings within the year. During the first half of fiscal 1955, commercial banks increased their investment in government securities by \$5,600,000,000; they liquidated \$5,800,000,000 of such securities in the latter half of the year to accommodate the rising private demand for credit.

These changes in bank holdings of federal securities in fiscal 1955 may be viewed against the background of previous developments. As one of the measures adopted by treasury and federal reserve authorities to combat post-World War II inflation, a substantial reduction in bank ownership of federal securities was effected over the period from Feb. 1946 to June 1953. Securities held by the banking system declined from \$116,700,000,000 to \$83,600,000,000—or from 42% to 31% of total federal securities outstanding. During fiscal 1954 bank holdings of federal obligations expanded to \$88,700,000,000. After the de-

cline in fiscal 1955, they amounted to \$87,000,000,000, or 31½% of the total.

Federal debt held by nonbank investors totalled \$187,400,000,000 at the end of June 1955, or nearly \$5,000,000,000 more than a year earlier. Within this large category, insurance companies and mutual savings banks effected a further liquidation of federal obligations. The total holdings of individuals showed little change on balance as higher income investors sold marketable bonds and invested the proceeds in savings bonds. State and local governments, U.S. government investment accounts, and miscellaneous investors continued to invest their accumulating pension and welfare reserves in federal bonds.

The increase of more than \$2,000,000,000 in corporate holdings mirrored a temporary investment of income tax reserves.

During the fiscal year 1955, interest rates on both short-term and long-term federal securities showed substantial advances from the lows reached in June 1954, but did not regain their peaks of June 1953. These advances stemmed largely from federal reserve open-market sales of government securities during a period of expanding private demand for credit. By June 1955, short-term rates (as reflected by treasury bills) had recovered about one-half of the decline registered in the previous fiscal year, when these rates fell sharply subsequent to the adoption of a policy of relative ease by the federal reserve.

Long-term rates commenced to rise after the treasury-federal reserve "accord" of March 1951, when the federal reserve in its government security operations began placing greater emphasis on the supply and availability of bank reserves and less emphasis on maintaining fixed prices of federal obligations. After advancing by one-fourth from March 1951 to June 1953 and attaining the highest point since the early 1930s, the average

yield on long-term treasury bonds dropped sharply during fiscal 1954. About one-half of this drop was recovered in the advance during fiscal 1955.

Interest payments by the federal government, consisting almost wholly of charges on the public debt, approximate \$6,450,000,000 in both fiscal 1954 and 1955. In its Aug. 25, 1955 report reviewing the 1956 budget, the bureau of the budget estimated that total interest payments by the federal government in fiscal year 1956 would amount to \$6,765,000,000. The increase over fiscal 1955 reflected an anticipated rise in the public debt and somewhat higher interest rates.

U.S. State and Local Government Debt.—The latest official estimates available in 1955 of the aggregate debt of state and local governments in the United States are shown in Table V. State and local debt amounted to \$37,904,000,000 at the end of June 1954, an increase of about \$5,000,000,000 during the fiscal year.

It was evident from available information on the volume of new offerings that the rise in such indebtedness continued into fiscal 1955.

These developments were an extension of past trend in the postwar period. After dropping from \$20,246,000,000 in 1940 to \$15,922,000,000 in 1946, the debt of state and local governments expanded steadily to the total of almost \$38,000,000,000 in 1954. In relative terms, the 1946-54 increase in indebtedness

was much larger for state governments than for local governments.

Construction outlays occasioned a very large share of all borrowing by state and local governments in the 1946-54 period. In addition to projects that had been postponed from the pre-1946 period, such outlays stemmed from requirements created by the rapid postwar rise in street and highway traffic and in the school-age population.

Other Countries.—In Table VI are presented data on the national debts of many countries of the world. Insofar as permitted by available information, the data are shown for 1939 and for a late postwar year, affording a comparison of national debts before and after World War II. (See also BUDGET, NATIONAL.)

(C. F. Sz.)

Defense, U.S. Department of: see BUDGET, NATIONAL; GOVERNMENT DEPARTMENTS AND BUREAUS, U.S.

Delaware. Delaware, on the middle Atlantic seaboard, one of the original 13 states of the United States, is called the "First state," having been the first to ratify the federal constitution, Dec. 7, 1787. The "Diamond state" is also a popular name. Area: 2,057 sq.mi. (land 1,978 sq.mi.; inland water 79 sq.mi.). Population: (July 1, 1955, est.) 371,000; (1950 U.S. census) 318,085.

History.—Outstanding legislation by the 1955 session of the general assembly was the creation of a state penal system to replace county-operated jails; consolidation under one head of state agencies for the mentally afflicted; adoption of a \$44,000,000 school-building program and increased appropriations for conservation of natural resources and state parks.

In 1955 construction of the first heavy industry in the state was begun: the \$160,000,000 plant of the Tide Water Associated Oil company refinery on a 5,000-ac. tract of farm land along the Delaware river shore north of Delaware City. In addition, during the first nine months of 1955 new construction in the state of all types of buildings amounted to \$57,126,330. Construction at the port of Wilmington, municipally owned, doubled the capacity of its marine terminal for handling cargoes.

The chief state officers in 1955 were: governor, J. Caleb Boggs; lieutenant governor, John W. Rollins; secretary of state, John N. McDowell; tax commissioner, C. Douglas Buck; bank commissioner, Randolph Hughes; state treasurer, Howard Dickerson; auditor of accounts, Clifford E. Hall; chief justice, Clarence A. Southerland; chancellor, Collin J. Seitz; president judge, Charles S. Richards; attorney general, Joseph Donald Craven; adjutant general, Brig. Gen. Joseph J. Scannell; direc-

tor, legislative reference bureau, Andrew Christie; director, state development department, Miles L. Frederick.

Education.—Desegregation of Negro and white pupils in the Wilmington and suburban area schools was completed in 1955 except for a few special classes.

The cost of operating the public schools in the fiscal year ending June 30, 1955, was about \$17,000,000, compared with \$16,250,000 the previous year. Elementary schools had an enrolment of 37,922 and a teaching staff of 1,348. Secondary schools had an enrolment of 22,547 and teaching staff of 1,118. For the fiscal year ending June 30, 1955, the state board of vocational education placed 456 disabled persons in earning jobs. The state superintendent of public instruction was George R. Miller.

Social Insurance and Assistance, Public Welfare and Related Programs.—State unemployment compensation paid for the fiscal year ending June 30, 1955, was \$3,067,605. Active claims on that date were 1,503. The cost of public assistance for the same fiscal year was \$787,886 for an average of 1,287 cases per month. In Oct. 1955, 1,688 persons were receiving old-age pensions.

During the fiscal year ending June 30, 1955, a monthly average of 1,022 children were cared for in their own or foster homes at a cost of \$271,790. The number of dependent children aided averaged 3,146 per month at a cost of \$1,085,400.

State appropriations for public welfare in 1955 amounted to more than \$5,500,000.

Communications.—The mileage of all highways and rural roads was 3,957. The income of the state highway department for the fiscal year was \$15,586,886, including federal aid of \$3,837,229. Railroad mileage was approximately 350. During the year ending May 31, 1955, 7,865,772 vehicles crossed the Delaware Memorial bridge; revenue, \$6,813,507.

For the year ending Oct. 1, 1955, tonnage at the port of Wilmington was 754,003; value of cargoes \$49,704,020. On Oct. 1, 1955, the state had 103,615 main telephones in use.

Banking and Finance.—On June 30, 1955, there were 60 state banks and trust companies, including branch banks and offices, having total resources of \$728,398,244. Assets of the 10 national banks were \$35,743,138. Demand deposits of all banks increased by \$50,158,779, savings deposits by \$13,413,656, during the fiscal year.

Total state receipts for the year ending June 30, 1955, were \$79,362,521, of which \$40,837,368 was from taxes and \$38,525,152 from special funds. The cash balance at the beginning of the year was \$26,434,339. Expenditures were \$84,213,252. The gross debt was \$84,491,000 and total debt service (interest and redemptions) amounted to \$5,799,798.

Agriculture.—The estimated total cash income from agricultural production in 1955 was \$98,820,000, of which \$73,902,000 was from livestock, \$24,918,000 from crops and \$390,000 government payments, compared with the total cash income of \$98,621,000 for 1954.

Manufacturing.—Gross receipts from 816 licensed manufacturers for the year ending June 30, 1955, were \$698,450,745, compared with 877 for the previous year with gross receipts of \$827,388,898. The total number of employees under the unemployment compensation law in March 1955 was 112,845. Total wages paid from April 1954 through March 1955 were \$466,845,000. The Wilmington area quarterly survey of employment Aug. 15, 1955, showed 72,403 employed by 557 employers compared with 64,650 by 574 employers on the same day in 1954. New corporations chartered at Dover for the year ending June 30, 1955, were 3,692 compared with 2,957 the previous year. Corporations that became void were 1,065 compared with 1,007 the year before. (J. EN.)

Mineral Production.—Delaware has the smallest mineral output among the states, and that entirely in building materials. Data for 1954 were not available in 1955, but in 1952 and 1953 (preliminary) sand and gravel totalled 515,399 tons and 520,817 tons respectively (\$382,484 and \$399,685); stone 94,911 tons and 80,364 tons (\$251,759 and \$215,382). The total value of mineral production was \$677,000 in 1952 and \$659,000 in 1953.

Democracy. The year 1955 brought some interesting developments in the progress of democracy in Asia and in Latin America. In Europe and in North America the situation remained on the whole without any fundamental change. Under the threat of fascism and communism, democracy had shown during and after World War II an astonishing resilience. The doubts about the viability of democracy in an age of industrial mass civilization, frequently heard during the 1920s and 1930s, had died down. A new spirit of confidence had filled the democracies after they had achieved victory over the worldwide threat of fascism in World War II and successfully contained the world-wide threat of communism after that war through unity and strength. The North Atlantic Treaty organization and the steps taken toward western European integration bode well for the future of democracy. The year 1955 saw, however, a weakening of the process of integration. This was partly the result of the new communist "peace offensive," which seemed to remove any immediate threat to the peaceful survival of democracy. The weakness shown by the French government in 1955 and the dispute over the Saar between France and Germany also contributed to the weakening of the democratic

Table I.—Leading Agricultural Products of Delaware

Crop	Indicated 1955	1954	Average, 1944-53
Corn, bu.	5,848,000	5,270,000	4,992,000

front in Europe.

Elections in Europe, 1955.—The most important election held in Europe during 1955 was the election in Britain in May. The Conservative party emerged as the strongest party and gained 23 seats, whereas Labour lost 17 seats. In the new house of commons the Conservatives were represented by 345 and Labour by 277 members. However, the voting strength of the parties showed a much more even balance. The Conservatives received 49.85% and Labour 46.42% of the whole vote. The communists received 0.12% of the total vote and were unable to elect a member to the house of commons, whereas before 1951 they were represented by two members.

Various elections in Germany to provincial parliaments showed a growing strength of the right-wing Social Democratic party. Whereas the elections in the Rhineland state brought a victory to the Christian Democrats, the party of Chancellor Konrad Adenauer, the elections in Lower Saxony, in West Berlin and in Bremen gave the Socialists a slight edge over the Christian Democrats. Both parties are strongly anticommunist and the communists were unable to gain more than 4% of the vote in these elections. But whereas the Christian Democrats supported fully the policy of the integration of the German Federal Republic into the North Atlantic Treaty organization, the Socialists opposed it because they felt it might hinder German reunification. On the other hand, in June 1955 the important elections for the regional assembly in Sicily, It., showed a renewed strength of the Christian Democrats, who received 38.8% of the vote. The communists and the fellow-travelling leftist Socialists held to their previous strength of 30.5% of the vote, whereas the Neofascist party lost heavily in favour of the Christian Democrats.

International Labour and Democracy.—In May 1955 the fourth world congress of the International Federation of Free Trade Unions was held in Vienna. At this meeting the representatives of United States trade unions played an important role. The International Federation of Free Trade Unions, which was formed in 1949 in opposition to the communist World Federation of Trade Unions, had rapidly grown in importance and had decided to undertake a world-wide organizing campaign in underdeveloped areas to organize the workers into anticommunist trade unions. The line taken by the congress against all totalitarianism was uncompromising. Not only Spanish but also Yugoslav trade unions were barred from membership. The delegates to the congress, representing 54,000,000 workers in the democracies, made it plain that democratic labour was opposed to all forms of communism.

Democracy in Asia.—Democracy in Asia and Africa showed its growing strength when at the Asian-African conference in Bandung, Indonesia (*q.v.*), in April 1955 many of the delegates unexpectedly arose to defend vigorously democracy against communism. The representatives of Liberia, Sudan, Lebanon, Turkey, Iraq, Iran, Pakistan, Ceylon, Thailand and the Philippines pointed in unmistakable terms to the dangers which communist aspirations implied for the freedom of noncommunist lands. On the other hand, in the elections in the British colony of Singapore, where the British administration granted self-government, left-wing parties gained a majority of members in the legislative assembly and communism showed a growing strength among the Chinese population of the colony. The elections on April 2 marked the first fully democratic step in Singapore and they were in agreement with the British policy of introducing democracy by progressive steps throughout the colonial empire.

In Thailand a political parties bill authorizing the establishment, after registration with the ministry of the interior, of political parties was passed on Sept. 20, 1955. The republic of Indonesia held on Sept. 29 its first national elections, in which

four parties struggled for leadership: the communists; the nationalist party, which had followed a neutralist policy in world affairs backed by the communists; the Mohammedan Masjumi party, which was friendly to western democracy; and the Muslim Teachers party. The new course to be followed by Indonesia in the wake of the elections, which brought no clear majority to any one of the four groups, was to be decided only when the new parliament would be seated in March 1956.

General elections were also held in Japan in the beginning of 1955. The Democrats, a conservative party, emerged as the strongest single party with 185 seats against 124 in the lower parliament, whereas its conservative rival party, the Liberal Party, managed to retain only 112 seats as against 180 in the preceding house. The conservative democratic forces as a whole lost 10 seats, whereas the "progressive" forces, the left- and right-wing Socialist parties, the Labour-Farmer party and the communists picked up 21 seats, having thus a combined strength of 121 seats, or one-third of the house. The communists received only 2 seats but they were supported by the left-wing Socialists with 89 seats in opposition to rearmament and to alignment with the United States.

Democracy in Latin America.—The most conspicuous victory for democracy in 1955 was the overthrow of the totalitarian regime of Pres. Juan Perón in Argentina. It was overthrown by a revolt of the army. Most damaging to Perón were the revelations about financial and social irregularities in his life. It remained to be seen whether the new regime would truly introduce democracy in Argentina or would become a new military dictatorship of the type so familiar in Latin-American countries. The first steps taken by the new government were promising. The Argentine supreme court, which had been a political instrument of Perón's, was dismissed and respected lawyers were appointed. The principles of freedom of thought and education were restored in universities and many scholars ousted by Perón were recalled. Anti-Peronist labour leaders were released from jail and free elections promised in the Peronist-controlled General Federation of Labour, which represented Perón's most valuable support. The future of the new regime would depend to a great extent upon the support which it would receive from the rank and file of Argentine labour.

Elections for the presidency in Brazil, held on Oct. 3, 1955, brought victory to Juscelino Kubitschek and João Goulart as president and vice-president. Both represented the Brazilian Labour party, a left-wing group led by the former president Getulio Vargas, who committed suicide in Aug. 1954. No clear political issues were involved in the election, as all the main candidates were agreed on the need to defend the social security rights of the workers and to develop Brazil's natural resources, especially its oil deposits. (H. Ko.)

Kubitschek and Goulart were to take office on Jan. 31, 1956, and the prospects of their doing so were apparently not threatened by changes in the presidential office which happened late in the year. Pres. João Café Filho took an indefinite leave of absence in early November following a heart attack, and the speaker of the lower house, Carlos Luz, was sworn in to take over for the remainder of the term. After two days, however, he was forced out by the army and Nereu Ramos, speaker of the senate, was installed as acting president. (See also COMMUNISM; EDUCATION; ELECTIONS, U.S.; EUROPEAN UNITY; GREAT BRITAIN; SOCIALISM; UNITED STATES.)

Democratic Party: see POLITICAL PARTIES, U.S.

Denmark. A democratic monarchy of north central Europe. Denmark has an area of 16,577 sq.mi. Greenland (*q.v.*), an island of 840,000 sq.mi. in the North Atlantic ocean.

is an integral part of the kingdom. Pop.: (1950 census) 4,281,275; (1954 est.) 4,392,400. Capital: Copenhagen (with chief suburbs, 1954 est.) 967,600. Other principal cities (1950 census): Aarhus 116,167; Odense 100,940; Aalborg 79,806. Religion: Lutheran Christian. Ruler in 1955: King Frederick IX. Prime ministers: Hans Hedtoft to Jan. 1955; H. C. Hansen after Feb. 1.

History.—Hans Hedtoft, prime minister of Denmark, died while in Stockholm attending a meeting of the Nordic council.

H. C. Hansen was confirmed as prime minister by King Christian IX on Feb. 1. In political outlook, including advocacy of NATO (the North Atlantic Treaty organization), he appeared thoroughly in agreement with Hedtoft.

The threatening economic crisis of 1954 was somewhat under control in 1955. Denmark had paid off much of its dollar debt and employment was at a high level; production in most categories was up slightly over the corresponding periods in 1953 and 1954, and exports were up. However, the price index continued to rise, and after a 5% increase workers were granted a similar wage increase. The root of the difficulty was that internal prices rose while export prices declined. To counteract the resultant squeeze the government took decisive measures to reduce buying and check imports. Additional duties were placed for two years on tea and coffee, and taxes of 10% to 15% were put on clothing, leather goods, jewellery, cars, radios and other items. Taxpayers would receive interest-bearing savings certificates redeemable gradually after 1962. The certificates were intended to avoid a rise in the cost-of-living index with its concomitant adjustment of wages and salaries. The austerity program was passed by a close vote—89 to 86.

Military expenditures were reluctantly curtailed as part of the program of saving. The 1955 budget was cut in this sector from 1,190,000,000 Kr. to 830,000,000 Kr., largely by reducing enlistments by 3,000 men.

Progress was made toward solution of some of the south Schleswig issues. The 42,000 Danish votes in this west German province (Sept. 1954) fell just short of the 5% requirement and gave the Danish element no voice in the Schleswig-Holstein *Landtag* or in the *bundestag*. Negotiations in Denmark and a visit of Prime Minister Hansen to Bonn in the spring of 1955 found an understanding response, confirmed by action of the *Landtag*. Agreement was reached for abandonment of the 5% clause, for the right of the Danish-speaking group to establish high schools and to receive 80% instead of the previous 40% of the funds allotted on a per pupil basis for the German elementary schools. Additional guarantees affected religious, political and individual freedoms for the Danish minority. In municipal elections later in the spring Danish individuals won several posts.

In Nov. 1954 the general assembly of the United Nations affirmed by a vote of 45-1 the arrangements of 1953 by which Greenland was incorporated into Denmark. In another of Denmark's overseas areas, the Faeroe Islands (*q.v.*), an incident of rebellion received wide attention. The home rule authorities called on Denmark to help them eject Olaf Halvorsen as medical officer in Klaksvig. A motor ship and a contingent of police were sent from Copenhagen, but because of the intensity of local feeling they did not land at Klaksvig. Danish Finance Minister Viggo Kampmann went out to use his good offices, and a peaceful arrangement was made whereby Halvorsen returned to Copenhagen. Disturbances broke out again in Sept. 1955, and a police ship was sent direct to Klaksvig; republican agitation seemingly lay at the root of the trouble.

Denmark began manufacture of Salk polio vaccine in Sept. 1954, and in the spring of 1955 gave nation-wide vaccinations (two) to 98% of the children in the first five grades of school.

Inoculation of preschool children, scheduled to begin in August, was postponed until October.

Representatives of Denmark and the United States initialed on June 10 an agreement for Danish participation in the "atoms for peace" program, according to which Denmark would be given information and would be loaned fissionable materials for research purposes.

(F. D. S.)

Education.—Schools (Jan. 1953): primary, middle and secondary 4,040, pupils 582,555, of which 97,149 secondary (101,753 in Jan. 1954); (1952-53) folk high schools 58, pupils 6,193; vocational 642, pupils 109,612. Teachers' training colleges (including physical and domestic science) 28, students 4,707. Universities 2, students 6,447; other institutions of higher education 8, students 7,007.

Finance and Banking.—Monetary unit krone (pl. kroner), with an exchange rate of 6.907 Kr. to the U.S. dollar. Budget (1954-55 actual): revenue 3,223,000,000 Kr.; expenditure 3,215,600,000 Kr.; (1955-56 est.) revenue 4,344,000,000 Kr.; expenditure 4,056,000,000 Kr. Internal debt (March 1953) 7,293,800,000 Kr.; external debt 1,757,700,000 Kr. Currency circulation (Dec. 1954) 2,054,000,000 Kr.; (July 1954) 1,872,000,000 Kr. Bank deposits 5,204,000,000 Kr.; (July 1954) 5,377,000,000 Kr. Gold and foreign exchange (U.S. dollars, 1954; March 1955 in parentheses) U.S. \$143,400,000 (\$131,400,000).

Foreign Trade (1954).—Imports: 8,024,000,000 Kr., exports 6,549,000,000 Kr. Main sources of imports U.K. 26%; Germany 20%; other continental European Payments union countries 33%; Latin America 6%; U.S. and Canada 5%. Main destinations of exports: U.K. 36%; Germany 15%; other continental E.P.U. 22%; U.S. and Canada 6%; Latin America 6%. Chief exports: bacon 15%; butter 15%.

Transport and Communications.—Roads (1954): 82,898 km. Motor vehicles in use: cars (1954) 290,279, commercial vehicles (Dec. 1953) 81,809. State railways (1954): 2,651 km.; passenger-kilometres (1953) 27,522,000; freight ton-kilometres (1954) 1,151,000,000. Shipping (July 1954): merchant vessels of 100 gross tons and over, 704; total tonnage 1,613,903; net earnings (1954) about 450,000,000 Kr. Air transport (1954): passenger-kilometres 240,077,000; freight, ton-kilometres 7,212,000. Telephones (Jan. 1954): 825,879. Licensed radio sets (1953): 1,322,000.
